UNCLE SAM WANTS AUTO EXPERTS

YOU CAN QUALIFY IN 6 WEEKS TO DRAW BIG PAY.

The government is paying high salaries to trained auto experts — to men who can drive a pleasure car, truck, ambulance, motorcycle or any other motor-driven vehicle—to men who know how to find and remedy trouble if anything goes wrong.

Milwaukee Motor School

Graduates are in the U. S. Service at good pay

Preference is always given to trained men—particularly to auto mechanics. Food, munition and supplies will be moved by men who can best drive and care for automobiles; and for such service you can draw better than soldier's pay.

We use no books—you get practical work on all makes of cars, trucks, etc—you do the work yourself under the direction of Mr. Arhelger and other auto experts.

Write us for free book and details telling how you can make big money as an auto expert.

Wm Arhelger

Graduates the Milwaukee Motor School has turned out recently have passed Uncle Sam's rigid examination for auto experts.

MILWAUKEE MOTOR SCHOOL, 221 Seventh St, Dept. G Milwaukee Wis.

PLANS FREE

Along with our iron parts we send FREE plans, and permit to build your own concrete mixer under our rights. In that way you secure a practical mixer for all cement work at a cost so low you can not afford to mix concrete by hand.

Build Your Own Batch CONCRETE MIXER

Save big money and backbreaking labor. Sheldon's Batch Mixer repays its cost ($11.50 up) on first small jobs—lasts for years. Ideal machine for farm jobs—designed by a farmer for farmers. No other like it. Patented. Mixes 2 1-2 cu. ft. a minute—keeps 1 to 6 men busy. Has chain drive, self-tilting dump, easily moved, all parts guaranteed. Does work equal to $200 mixers. Built-up machines, hand or power (1 1-2 h. p.)—or you can buy the iron parts and make your own machine.

Get Catalog and Special Offer

Shows our full line of mixers which are sold direct to you on strong guarantee. 90 days trial privilege. We want ten men in every county to accept our special co-operative offer right now which will help you to secure a machine at little or no cost. Write us today.

SHELDON MFG. CO. Box 2388 Nebraska, Neb.

Mix Your Own Concrete

Tell what you have for sale in a little advertisement in THE FARMERS' MARKET. Does not cost much and may be worth a lot to you. Six cents a word per insertion. See page 14.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

FARM BOYS WHO MAY BE DRAFTED.

I DO not believe there ever was a time in my life when the daily mail brought me so many heart-touching, tear-starting letters as nowadays. I am well within the truth, when I say that a dozen times a day I find my eyes swimming as I read the letters of fathers and mothers who lie awake at night, picturing their sons (their sole dependents) torn from them, to be thrust into the shell-riddled trenches of Europe, or hurled across the death-raked No Man's Land, to become cannon fodder in a twinkling. It is not lack of patriotism which causes these fathers and mothers of the farm to lie awake, trembling with fear, and to write me, begging me to do what I can to secure exemption for their boys. The fires of patriotism are burning brightly on the farm altars these days. It is not a lack of loyalty to the stars and stripes, I repeat; it is merely a realization that if their boys are taken, the farm home will be dismembered, the farm crops will rot or wither in the field, the farm herds will fade away, misery and want and ruin will stalk through the land, for production will diminish and poverty will ensue.

Let me print a few of these letters, just to show how the parent heart of the farm is troubled these days; how it comes that I go about my work with a heavy heart, bearing the burden of many and many a farm boy's usefulness, his very life, in fact. This first letter is from a devoted "mother in Israel," who pronounces this benediction in closing her letter. "I ask God's richest blessing on you and yours." Do you wonder, in view of such a benediction, that I have given her letter even more than the usual thought and attention? Here is part of what she writes to me:

We have been a subscriber to your paper for a good many years and like it fine, but I never thought I would ever ask a favor of its editor. I saw an article in your paper written by you in which you were in favor of exempting all the farmer boys from draft. I had thought of it right along, how would we raise a crop without experienced farmers? It is hard for them to handle the farm with all the drawbacks we have. Then, as you say, how would those who never have farmed do the best with our farms?

You have guessed long before this that I am a mother and that I am writing in behalf of my boy. And a very good, precious boy to me. He is all we have, just the one child. His father got injured some years ago and is quite an invalid. And I am fifty-seven years old and injured my right ankle so I am quite badly crippled. We have a 200-acre farm, part pasture and the rest we farm. Our boy is twenty-three years old, so you see he is one who had to register. He has something like fifty acres of oats that look fine and over fifty acres of corn, potatoes, beans and Sudan grass, and sixty acres of hay ground, or something like that. And he has done most of the work, as he just got a young man to help him about five weeks ago. His eyes trouble him during the warm and dusty weather, also when it is cold, giving him severe headaches. Has to wear dark glasses most of the time. He frequently finds time to help me, as I try to do my work alone. He is our only and main support. Without him it doesn't seem possible to run the farm, as we are trying to pay off quite a debt. He lost the best horse he had a few weeks ago.

It seems to me he is working as hard for Uncle Sam as is possible for a young man to work, as we have had so much rain and the corn needs plowing, getting very weedy, and when it dries it will be hard work. There are a large number of other boys I could name who are working hard on their farms and doing fine by putting up a hard fight against weeds and the elements to raise all that is possible. God knows I am sorry for the mothers in Europe and pray constantly for peace and God's blessing on all, but the mothers in the United States, where we have done nothing to bring on the war, God pity and bless every one, is my prayer.

I have written this distracted mother, saying I did not believe there was much, if any, danger of her son being drafted, under the circumstances, and that I would do what I could to help her out, should her worst fears be realized. Uncle Sam loves his farm boys; he is not going to make them, and their beloved mothers, suffer unduly; neither is he going to raise an army and send it across seas, without seeing to it that the farms at home are kept up to their highest stage of efficiency, that the army may be fed and clothed and our national prosperity maintained.

Here is another letter, from a boy liable to army service. It is rather long, but I do not feel that I can spare any part of it; you are entitled to it all:

I am a young man twenty-two and am running a 160-acre farm for my mother; that is, I am at the head of it. I have two brothers, seventeen and thirteen, respectively. I have no one solely dependent on me, which is one of the things asked about on the registration card, so I did not claim any exemptions from draft. While my folks could get along without me, I think they will find it pretty hard going, as we are all hard at it all the time. I began to run this place when I was sixteen and I found it hard digging. We have more land broke out now, more stock, more work, harder work now than we had then. There is probably no man who can take hold of things here and make them go as I do. I know that my brother cannot, for he, at seventeen, is not as big or strong or as capable of managing things as I was at sixteen. One thing is certain, that if I leave here a capable man will have to be put in my place or production will decrease. What I want to know is, since I did not claim exemption on the registration card, have I a right to do so in case I am drafted? I will simply place the facts before Uncle Sam and if he wants me to go to the trench at the expense of production of crops or the saving of crops already produced, I will go, for I'm no coward. That is the reason I did not claim exemption. Or was I too big a coward to claim exemption? I would be almost certain to pass the examination, as I have nothing the matter with me, so it will do no good to claim exemption along that line. I don't use tobacco in any way whatever, let alone alcoholic beverages.

My life is probably an exception. Most young people want to be where they can have a gay time, they want to be in the "crowd" where there is excitement and pleasure. I was never that way. I chose my life work early, at thirteen, and have never once thought of changing my mind. And I have been working towards it as much as possible ever since. At sixteen I wanted to go to the State School of Agriculture as soon as I could. But I had no more than decided on this when my brother next older than myself became tired of the farm. He went to business college with the intention of becoming a great business man. But he spent three years of his life and a lot of money and learned nothing. The gay life carried him away. He went back to the farm, contented that city life is not what it is cracked up to be. With my brother gone I became the "boss" and how could I go to agricultural school? I didn't go and never will. But that is not saying that I am not getting an education. I am taking a course in agriculture by mail from the biggest and finest institution of its kind on earth. And I like it. I read and study the farm papers. I study bulletins from the department of agriculture. I try to pick up information in every way available. And (I hope you will not call it boasting) I have always done as well as most of my neighbors and better than some. I wish to tell the boys (or girls either) that it is not necessary to leave the farm in order to get an education. Stay on the farm is my advice to all farm boys and girls.

I cannot make it too emphatic that I would consider it a crime to tear such a boy away from the farm, away from the parents and younger brothers dependent upon his work, to send him to the battlefields of Europe. Farmers are not to be exempted from army service as a class, but as individuals, where the conditions warrant it. In this case, the conditions certainly warrant exemption.

One thing I want to point out is this: Exemption can be claimed after the draft, even if it was not claimed at registration. Many farm boys have written me in regard to this. I shall print more of their letters, on this phase of the subject, next week, but I want to set their minds at rest thus early.

My heart bleeds for those who suffer nowadays, as the war clouds hover lower and lower over our beloved land. But, in the midst of war and its alarms, let us not forget that "God's in His heaven, all's right with the world" and that "He, watching over Israel, slumbers not nor sleeps."

A CHAMPION OF THE SINGLE MAN.

SOME time ago I received a letter from a farmer who is through, for all time, with unmarried helpers. In the course of it he stated he had paid his last single man (back in 1910) $27 a month, kept a horse for him, furnished board and washing, and gave him most Sunday nights off. Since then he has hired only married men, finding that they are to be relied upon more and that they ask for less in the way of extras. My correspondent concluded his letter in this manner:

Married men are steadier and more satisfied. They have their own family to be with nights and Sundays, when they are not busy. They cannot pick trouble out of nothing and leave in thirty minutes, as the single man can, because they must have a house to move into before they can leave.

I hope others among my Wisconsin readers will write me on this subject, giving me their views and experiences. Personally, I find the subject very interesting. As I said before, being single is no crime, and we should not condemn all unmarried farm hands simply because they have not yet found the right woman. Marrying does, of course, steady a man down and make him realize the responsibilities and duties of life more. But, on the other hand, some of the best, most efficient and most dependable farm hands I know continue to live in single blessedness, permitted by their employer to use the family bathtub, not only on Saturday nights, but as often as they wish.

THE MORTGAGE THAT NEVER COMES DUE.

I AM indebted to Mr. B. F. Faast, of Eau Claire, vice president of the Federal Land Bank, of St. Paul (which serves Wisconsin, in addition to Minnesota and Michigan), for the best explanation of the amortization or partial-payment phase of the new federal farm-loan law which I have seen anywhere. In a personal letter, just received, Mr. Faast states that Wisconsin farmers are availing themselves of the opportunities under the new law to a large extent, the result being far more satisfactory than Mr. Faast and his fellow directors of the federal land bank anticipated. He adds that the new law not only enables Wisconsin farmers to obtain long-time loans from the federal bank at 5 per cent, but it has had the effect to reduce the rate of interest in all sections of the country, due to the competition of the federal system. He continues: "This fact alone is going to save the farmers in this section of the country thousands of dollars annually. This money, of course, will go back into further improvements and assist in the general agricultural development."

I want to set forth Mr. Faast's explanation of the amortization system in full. It was written expressly for readers of The Wisconsin Farmer, and follows:

An amortization mortgage is rather a new word to the average American borrower. It means a loan on which part of the principal as well as the interest is paid on the regular interest payment dates. In Europe the amortization plan has been known to the farmers and used by them for about 150 years; and within the next few years (if we may judge from the number of applications for such loans which the Federal Land Banks have) many American farmers will be taking advantage of the economical kind of farm loan.

From a comparison of the amortization plan of paying mortgage indebtedness with the customary five-year method of payment we learn some interesting facts.

Under the usual method, a $1,000 loan running for thirty-six years at 5 per cent (no payment being made on principal) at the end of the period will represent the total paid-in interest, $1,800; if then, the principal sum is paid, it would make a total amount of $2,800 paid by the borrower (both principal and interest) during the thirty-six years. This does not include the cost of renewing the loan at each customary five-year period.

Under the amortization plan, the semi-annual payment includes, in addition to the payment of interest, a small payment upon the principal. Thus, if a $1,000 thirty-six-year loan is secured through one of the federal land banks, the borrower pays $30 each six months for thirty-six years, with the exception of the last payment, which is $46.56. This payment represents 5 per cent on interest and 1 per cent on principal, making a total annual payment on principal and interest of only 6 per cent. Therefore, by paying at the rate of only 6 per cent each year, both the principal and the interest will be fully paid at the end of the thirty-six years, and the total amount paid in interest during this period would be $1,176.56, and adding the principal payment of $1,000, it would make a total of $2,176.56, against $2,800, a saving to the borrower under the amortization plan of $624.44.

Or let us figure this another way. The actual interest paid on a federal farm-loan mortgage under the amortization plan is 5 per cent. The apparent interest, however, figured on the basis of the total interest of $1,176.56 actually paid is approximately 3¼ per cent. Plainly the amortization plan saves the borrower money. Because of the reduction of the principal each year he gets the benefit of the diminishing interest.

One advantage of the amortization plan is, therefore, that it saves the borrower money. But a further great advantage of the plan is that at no time does the total principal become due. The farmer never has to worry over the fact that on a certain day he must pay his $1,000 mortgage, or secure a renewal of it. Under the federal plan, he has only to pay a charge or a tax—as we might call it—of 6 per cent per annum, which will, in thirty-six years, pay the entire principal and interest. An amortization loan of this kind cannot be classed as a mortgage in the usual meaning of the term mortgage; it is rather a charge against the land, payable in six-month installments.

It will, therefore, be readily seen that even when the rate is the same (5 per cent) the amortization plan has many advantages for the borrower over the customary straight five-year mortgage.

"The mortgage that never comes due" would be a good name for the loans made through the federal land banks. I have predicted success for the plan ever since it was inaugurated. I am still confident. Mr. Faast makes it all so plain that none of us need be frightened by the formidable sound of "amortization." If it saves us money and helps a good financial system to work well, we should, all of us, welcome it eagerly, as I am sure we shall.

THE WISCONSIN FARMER, Madison, Wisconsin

Wisconsin Legislature.

The Wisconsin Council of Defense, through the food bill which has passed both houses, is given full power to seize food, fuel, storage houses and fuel depots should the attempt be made by speculators to boost prices or in case a serious scarcity arises. Senator Wilcox in speaking for the bill praised the measure, as he saw in it an efficient weapon to curb speculators. Not only does the act give the council of defense the power to seize the foodstuffs but it serves as a warning in advance to such men.

The governor has signed the bill for providing a tuberculosis sanitarium in northern Wisconsin, but he has withheld approval of building this during the war. The bill appropriates $75,000 for buildings, but makes no provision for equipment and maintenance. The cost of other sanitariums proves that additional funds are necessary to get such a building under way. Labor is needed for war purposes, according to the governor, and a larger sanitarium is needed in the state than the one provided for. For this reason it will be up to another legislature to appropriate sufficient funds to cover all expenses.

The legislature in a joint resolution has decided to give all members of the National Guard from Wisconsin, who served on the border during the last year, an appropriate decoration in the form of a badge which will be part of the uniform of the Wisconsin boys.

For the first time during the present session the governor's veto was overruled by the senate, which passed the bill providing for state aid for armories for the National Guard. The bill provides an annual appropriation of $52,500 for the annual construction of three armories. The governor in vetoing this bill held that during time of war the need for armories was not as great as in peace times, as the federal government took care of the soldiers to a large extent. The senate, however, decided to overrule the veto and the bill is now in the assembly. If this body also overrules this veto the bill will become a law in spite of the governor's disapproval.

Both houses of the legislature are promising to wind up the season's work very shortly now and the farm legislation will probably be finished up within the next week.

Importance of Wisconsin Live Stock Industry.

According to official information compiled by the Wisconsin Live Stock Breeders' Association there was, on January 1, 1917, live stock in Wisconsin of the total value of $274,129,000. This report does not cover poultry or bees. In the year 1916 the estimated value of all farm crops in Wisconsin was $208,770,000, or more than $60,000,000 less than the capital invested in live stock at the end of the year 1917.

From this it will appear that the live stock business is a matter of very great importance in Wisconsin. On January 1, 1915, the state live stock valuation was estimated $254,130,000. Federal inspection records for the year 1915 show that within that year beef, mutton, wool and dairy products were sold to the total value of $185,250,000.

This would indicate, according to the estimate of the Wisconsin Live Stock Breeders' Association, that in the year 1917 Badger farmers may expect to participate in the distribution of $200,000,000 as receipts from live stock and live stock products. The increase will come from increase in value of stock and live stock products rather than from increase in volume of sales. Had we, as Wisconsin farmers and stockmen, had the foresight several years ago to have engaged more extensively in the raising of beef, hogs and sheep, think what a great sum might be added to the state's wealth this year. We have not even gained in dairying as we should have gained, despite all our efforts. The percentage of farmers who make a study of feeding for production—a study based on their own as well as the experiences of others—is still all too few.

A dairyman in Taylor county, a member of the Medford Cow-Testing Association, had the banner cow among the thousands listed under the seventy-five cow-testing associations of the state in April. And this production was accomplished in a time when feed was the shortest and highest in price it has ever been known to be in Taylor county. The performance is the result of study of the ration which produces the most milk, cost and effect upon the cow always considered.

If a dairyman in a new country on high-priced feeds, and amid great scarcity of feeds, can win a state record, how many thousands of dairymen in this state, by giving closer attention to their cows, and what they are feeding, and knowing, either from their own or the experience of others just what feeds will produce at biggest profit, could not only better their own conditions, but help in the great nation-wide campaign to provide food for the nations which are fighting for free government?

Co-operation from Badger Farmers.

Mr. Geo. Carpenter, of Sauk county, Wis., at a recent meeting held in Madison, discussed the relation of the farmer to the war. In part he said:

This great problem of increasing the food supply for Wisconsin and in part for the world, rests entirely with us. We can't afford to let one acre in any community lie idle. We can't afford to permit poor farming in this state this year. We can't allow the farmers to raise weeds instead of grain. We must see that crops are properly taken care of and harvested, for if this war is continued for three years, as it is now estimated it will be, two people will starve to death to every one person killed by a bullet. The man behind the plow is fully as necessary as the man behind the gun, but if this man behind the plow does not do his duty, it is the duty of every patriotic citizen to see to it that such a man is recommended for draft and put in the army. Sub-committees, appointed in every township and working under the direction of the county and state council of defense, should see to it that the live stock industry is properly looked after as well as the crops. These workers could get the exact facts. Personally, I favor a system of premiums or badges for men and women, boys and girls who have largest yields of food products, conditions considered. It is the duty of the members of the defense councils either the state council or town, to find out the amount of farm labor needed and see that the problem is cared for. I am satisfied that in our own state we will be able to gather the harvest, as our citizens are volunteering their service and we will be able to use the crews on the country roads. I understand that a great many married men are applying for positions on farms. This is the best kind of help we can get. The farmer boy or girl who wears the badge of honor for the production of food may be just as proud of this badge as a soldier or nurse who gets the medal of honor for work at the front. The men and boys who will not speed up on the farms in Wisconsin this summer should be recommended for draft in the army so that some competent person may take their place on the farms. I must have the coöperation of every man interested in agriculture, and if I can't get it I should feel like resigning and letting someone else fill the position of chairman of the committee of agriculture.

One secret of the success of the German people in the war has been their resourcefulness in mustering all classes of citizens to the support of the war. The writer talked recently with a gentleman who had come from Germany just previous to the present war. Small divisions of agricultural communities in Germany were found to be thoroughly organized with competent leaders, who had all the facts concerning their community in hand. One of these leaders was found to have a card index report of every farmer in his district. From this report you could ascertain that Hans Schmidt, for instance, had one sorrel horse, five years old, one bay mare, seven years old, two aged horses, one gray and one roan, one set of harness in good condition, one set of harness in need of repair, etc. The report would show the amount of grain on hand on the farm at a certain date, the amount of potatoes and fodder, the number of milk cows, poultry, etc. Also the number of acres in the farm, the age of the farmer, his wife and all his children. In this particular instance, according to the report which the writer heard, Hans Schmidt was under orders, immediately war should be declared, to strengthen the timbers under a certain small bridge across a brook along the highway adjoining his farm. These facts are stated simply to show the importance which a great military nation gives to its agricultural producers. If, here in America, we had everything worked out to a fine detail, as it has been worked out in Germany for the last quarter of a century, there would be no need, now, of urging greater food production for the support of ourselves and our allies. The Wisconsin Farmer bespeaks for Mr. Carpenter a generous support through the growing and harvesting season. As Mr. Carpenter says, "the country needs it and we must have it."

KEEP THE RASCAL OUT.

Big Questions of the Day.

Who is to be exempt from army service? How are the men to be drawn? Shall farmers be exempted as a class or as individuals? How may Liberty Bonds be purchased? How is the federal farm-loan law working out? What amounts are being loaned by Uncle Sam on farms in each state of the grain belt? How is the great war progressing? Shall there be a food dictator to determine maximum and minimum prices for farm products?

All these and a host of other important national questions are discussed, and answered, in The Wisconsin Farmer from week to week. No farmer in this part of the country can afford to be without a practical, thorough farm paper which discusses such vital topics impartially and fearlessly, in addition to giving him the practical advice and information he needs on all farming matters.

See to it that your subscription to The Wisconsin Farmer is paid in advance at least a year, so as to insure receiving every copy at this most important and critical time. Induce as many farm friends and neighbors as possible to subscribe, so that they, too, may receive the benefit of the service being given to the farmers nowadays by The Wisconsin Farmer.

We shall continue to make this paper both the mouthpiece of the farmer and the forum for public discussion of matters of vital farm interest. Do your share by renewing your subscription promptly and securing as many new subscribers as possible.

Restricting Export of Brood Mares.

From the war department comes the announcement that the purchase and export of more than 200,000 mares from the United States has already been made and it is now planned to restrict their exportation as much as possible. Secretary of Agriculture Houston has advised the war department that a curtailment of the shipping of mares is desirable to prevent a shortage of breeding animals in the near future.

Already the British purchasing commission has agreed to stop buying mares for military service, but the Italian and French agents have expressed a fear that following such a course would prevent them from buying an adequate supply of horses. The conference recently held resulted in the Italian, French and British commission agreeing that they would not purchase mares under eight years of age. This plan will continue until July 31st when definite arrangements for the future will be made.

Our own war department purchases no mares whatever, it pays higher prices than the allies have been paying, but it requires higher standards, and it uses entirely horses and mules.

The Jackson County Guernsey Breeders' Association will hold their annual picnic this year at the C. S. Ristow farm, June 23d. All interested in live stock are invited to attend.

Polk County Federation Meeting.

P. F. AMERY, PRESIDENT, FEDERATION OF POLK COUNTY CLUBS.

MARTIN STENERSON, SECRETARY, FEDERATION OF POLK COUNTY CLUBS.

C. W. BRACE, TREASURER, FEDERATION OF POLK COUNTY CLUBS.

ALMOST a thousand Polk county, Wis., farmers attended the summer gathering under the auspices of The Federation of Polk County Clubs, at Deer Lake Park, Saturday, June 16th. It was the first summer meeting of the federation organized January 20, 1917, and more clubs, of a single county, were represented than at any previous meeting of the kind in the state. The county now has thirty clubs, in addition to the large number of equity societies, shipping associations and other farmers' organizations, and may justly claim that it is one of the best organized counties, among farmers, of any county in the state. The clubs are not so large in point of membership as in some counties, but the interest is great in farmers' club work, and unless some other county in Wisconsin gets busy very quickly Polk county is likely to carry off many of the honors in state club work.

The federation meeting was held in a park overlooking beautiful Deer Lake. Farmers' club work in Polk county is the outgrowth of Minnesota clubs. The first club was organized on the Minnesota side of the river in 1911, and is known as Interstate Farmers' Club. This club has held regular monthly meetings throughout the winter for six years and has planned to continue these meetings for the coming year. Affiliated with the club is a live stock shipping association.

Just at present there are twenty clubs in Polk county affiliated in the Federation of Polk County Clubs. This will be increased by several in the next few weeks. Several of th equity societies are planning to join the federation. Another big federation meeting will be held in the winter. The plan is to hold two big county meetings a year, one in the summer and the other in the winter. The initiation fee for individual members for the year is 25 cents and each club which joins is required to pay $1.

Such an organization as has been formed in Polk county could not have been successful but for the splendid class of citizenship in this county, and the successes which have been made by the farmers. We met farmers at this big picnic who ten years ago were worth practically nothing, and had bought their land on payments, the first payment in most cases being a small one. Now they have their farms cleared and paid for, well stocked, and are independent. The soil in Polk county is fertile, and the climate favorable for corn, potatoes, all the grasses and grains, and for hardy fruits. The present season is somewhat backward, as it is throughout the entire state. Potatoes look good, but corn is coming slowly. Good warm sunshine for a few weeks will bring all these things out in fine shape. The St. Croix Valley district has not had the cold rains which have visited southern Wisconsin.

The story of farmers who have settled in Polk county within the past twenty-five or thirty years is uniformly the same. Some of them have had to work pretty hard, but success has always crowned their efforts. At this season of the year the country looks beautiful. Possessed of natural beauty, the green hills and fertile valleys are inspiring to the man who has an eye for good farming and dairy land. Once Polk county is all settled, it will push many of the older counties in wealth of land and production of farm crops. The county is well supplied with good schools and has fine roads, the winding drives being a delight to the motorist as well as an all-the-year-'round convenience to the farmer. Wisconsin people who have not visited Polk county have missed seeing a portion of the state richly endowed with natural resources and scenic beauty. On the grass-covered hills are many splendid herds. Hogs are paying well in Polk county and there are a considerable number of beef cattle. The county is noted for its clover crop. All grasses grow luxuriantly. The county is dotted with numerous lakes, mirrored between the green-clad hills, a picture which constantly delights the eye.

JAMES M. PIERCE, PUBLISHER THE WISCONSIN FARMER.

The federation meeting was one of the most successful which has ever been held in Wisconsin. The attendance will grow as the rich farm lands of this favored county are occupied. George H. Hazard, of St. Paul, one of the organizers of the Interstate Farmers' Club, presided at the meeting upon request of P. F. Amery, president of the federation, and Martin Stenerson, county superintendent and secretary of the federation. Prof. George C. Humphreys, of Madison, head of the animal husbandry department of the Wisconsin College of Agriculture, spoke on organization work in Wisconsin—the best organized state in the Union, in so far as farmers are concerned. D. E. Williard, of St. Paul, agricultural representative of the Great Northern Railroad, spoke at length on marketing problems, giving the farmers present at the meeting the benefit of some of his personal experiences in handling farm products. These addresses were well received. William H. Wiseman, associate editor of The Wisconsin Farmer, spoke for James M. Pierce, publisher of this paper, Mr. Pierce having been invited to deliver an address and being unable to attend. Mr. Wiseman read an address prepared by Mr. Pierce. Mr. Pierce sent his keen regrets that it was impossible for him to attend this meeting. His address, as delivered by Mr. Wiseman, was as follows:

Mr. Chairman, Officers and Members of the Federation of Polk County Clubs:—

I am indeed pleased and proud to be represented on your program this afternoon and only regret that I cannot be with you in the body as well as in the spirit. It is an occasion to which I have been looking forward with the greatest anticipations and none of you can begin to share the regret which I feel that it is impossible for me to address you personally. However, I am glad to send this message to you through one of my associates on the editorial staff of The Wisconsin Farm-

SOME EXAMPLES OF MODERN FARM HOMES AND BARNS BUILT UP AS A RESULT OF GOOD FARMING AND DAIRYING OPERATIONS ON THE SPLENDID LANDS OF POLK COUNTY, WISCONSIN.

er whom I have asked to bear my words of greeting to you.

Polk county means much more to me than could be told in words, for it is the home of many hundred loyal friends, who have been patrons of my paper for years. It has been well said that there are no friends like the old friends, and so, indulging in a moment's sentiment on this occasion, I want to express just a little of the kindly feeling I have for those of you whose hands I may never have clasped and into whose eyes I may never have looked, but whom I cannot help from regarding as old friends, because of the loyal support, help and inspiration which you have given me. I feel that Polk county, like all Wisconsin, is holy ground for me, and that if I could but be with you today, I would indeed be in the house of friends.

Although Polk county is not one of the older counties of our state, it has contributed its full share towards Wisconsin's greatness and glory, helping to put it in the front rank of all the farming states in the Union, with the largest percentage of farms operated by owners and with the most intensified and diversified agriculture of any in the sisterhood. And Polk county has done more and better than this—it has added to Wisconsin's wealth of good men and women and contributed to her ideals of good citizenship. I hold with old John Knox that this is the greatest contribution which any people can make and that every good citizen is that much in riches added to the commonwealth.

I find most eloquent testimony to the progressive spirit of Polk county farmers in your federation of clubs that has set an example of which all Wisconsin may well be proud and follow. I believe that, with twenty-one clubs affiliated into this splendid organization, you lead all other counties in the state, Sauk county being second with eighteen and Walworth county third with ten. I see in this fact a prophecy of an even stronger organization in the days to come, when Polk county will furnish a model, not only for Wisconsin, but for harmonious coöperation among farmers' organizations for all states in the Union. I congratulate you most heartily on this fact and pledge you unreservedly the support of The Wisconsin Farmer in helping to realize this promise.

This is the day of coöperation everywhere, and in few states has coöperative effort been carried to a greater or more beneficial extent than here in our beloved Badger state. The time has come when no man can play his part with greatest credit to himself, his family and his state when working independently, as an isolated individual. The old individualism of pioneer days, when each person or family was self-sustaining and sufficient unto itself, have passed away and today we recognize that in union there is strength and that the spirit of the times demands united effort for common ends. Only in this way have the greatest advances been made along agricultural, as well as industrial lines, during recent years. It is natural that agriculture should have lagged behind industry somewhat in this respect, so that there is a tremendous undeveloped field for further coöperative effort among the farmers of this country in solving their mutual problems and satisfying their common needs, and nowhere is there a richer, vaster field for this work than right here in Polk county, where you have made such a splendid beginning.

Among the many problems which you face and whose solution through united effort would contribute immensely to the prosperity of this state, this county and the individual members of this federation, are those of clearing and draining. This is especially true of the former, as the legislature has provided the legal means for drainage projects, assessing the cost of them to the benefited lands. But, so far, no legal machinery has been provided for clearing off stumps and brush by anything excepting individual effort. If this were done, Polk county, with its thousands of fertile acres held back from cultivation for this reason, would become an agricultural empire that would challenge the attention of settlers far and wide, and would increase its production of agricultural wealth many fold with every passing year. Congress saw fit to give the nation the Carey Act, making it possible to expend millions in an effort to reclaim the dry and barren desert lands of the West—an act, by the way, which has been shamefully abused by swindling promoters and fly-by-night imposters, who have gulled the credulous public with impossible irrigation projects. Might congress not much better see merit in providing means for reclaiming lands, such as those here in Polk county, naturally fertile, in a climate where all conditions are favorable, close to the greatest markets, as can be so easily done by merely removing the stumps? It requires no such tremendous expenditures as the reclamation of arid western deserts; no experimentation, no complicated engineering schemes by which promotion companies can make immense profits out of projects wholly worthless. All it needs is the funds and initiative for performing on a large scale a simple, practical work, which can be done in that way much more cheaply and quickly than if left to individual enterprise. And the results are not in doubt—they are demonstrated all over Wisconsin, wherever they have been tried, and they are as sure to yield immense returns in agricultural wealth as anything can be. Surely here is a rich field for coöperative effort in Polk county and one that will literally fulfill the scriptural injunction of making two blades of grass to grow where there was only one before.

Another problem which you in Polk county, in common with farmers everywhere, face, and which is growing more serious with every passing year, is that of securing better marketing conditions, and I know of nothing in which coöperative effort would be productive of surer and better results than along this line. Blessed in every conceivable way by nature for the production of grass, corn, wheat, potatoes, small grains and a dozen other crops, there yet remains for you the problem of marketing. For what doth it profit a man to raise bumper crops if he can-

WILLIAM H. WISEMAN, ASSOCIATE EDITOR THE WISCONSIN FARMER.

not sell them at a good margin on his investment and labor expended? I said that this is a problem which Polk county shares with all other counties of the grain belt, and it was never more strikingly illustrated than today, when the farmers everywhere are failing to receive their fair share of the advance in the price of agricultural products. For example, most of the farmers of the grain belt sold their corn last fall at from 75 cents to $1 a bushel, and yet today it is bringing over $1.50 a bushel on the Chicago board of trade. Wheat which sold for $1 to $1.50 per bushel is now bringing over $2.50. Who got the difference between the price for which the farmer, who produced it, sold and the price it is now bringing? Someone who had no investment in farm land or machinery, who did no plowing or harrowing, no planting or cultivating, no hauling, no worrying, made the big end of the profits. A striking example of this was furnished here in Wisconsin the other day, when a woman bought a bushel of potatoes in one of our large cities. Noticing that one potato, somewhat larger than the rest, had been cut open, she broke it apart and found a note from the man who raised it, which read, "I sold these potatoes for 95 cents a bushel. What did you pay?" The woman had paid $4 a bushel! Somewhere between the producer and the consumer $3.05 had been absorbed. Now, my friends, I say to you that such a condition should not be possible. Nor do I mean to decry the services of the middleman, as we call him. He serves a useful and necessary function under our present wasteful method of distribution, but I do maintain that in such instances as those quoted his profits are out of all proportion to his services. I realize that it is a delicate thing to attempt to regulate economic forces by law, but I firmly believe, especially under present abnormal conditions, that something should be done to limit the profits of the middleman or men to a reasonable and fair return on the time and capital which they have expended AND NO MORE, always with an eye to the principle that the man who really creates wealth shall receive the largest share of it. In that way I believe we will approximate the ideal of letting the producer receive more for his toil and the consumer pay less for his products. You may call this paternalism or whatever you like, but, for my part, as I view the great, powerful combinations of capital and labor, and realize their absolute control of so many of the necessities of life, compelling tribute where no tribute is due, I believe most firmly in the protecting arm of the state and federal governments being used to carry out the policy of "live and let live."

But even this is not the surest and best solution to the problems of marketing which confront you, for you can work out your own salvation much better than the best of governments can work it out for you. When we consider what has been done here in Wisconsin by the coöperative efforts of the American Society of Equity, when we study the example of how the farmers of North Dakota have benefited by the building of elevators for the storing and handling of their grain, it opens up the great possibilities which could be further accomplished by you along this line. Is it not worth more study and investigation at least? I would not urge farmers to rush pell-mell into untried experiments which might prove unsuccessful and entail financial loss, but I do believe that it would pay the members of the federated clubs of Polk county to investigate carefully the experience of similar undertakings for coöperative marketing. I appreciate, of course, that the members of this organization are busy men and that you save considerable time and effort by selling quickly to the nearest buyer for what you can get, but I never could understand why the farmer should be the only big business man in the country who has nothing to say about the price set upon his product. If a man offers you a price for your colt or calf which you think is too low you refuse it, but if you are offered 75 cents for corn which you know will sell for more than a dollar later, you accept it unhesitatingly.

Of course, the great fundamental trouble is that the farmers as a class have not been united, while the powers that prey on their divisions are always united. This is true not only in economic matters, but in political affairs, as well. In a state like Wisconsin, with its vast agricultural wealth and population, the farmer is the largest stockholder in the biggest business corporation in the state—the state government. He is the one who suffers most from misrule and the one who benefits most from good government. He should never be a narrow partisan in state affairs, but always an active participant in them, for if he does not look after his own interests, which are the largest interests, he can be sure that no one else will.

In this connection I always recall the words of the immortal Lincoln, uttered in an address before our Wisconsin State Agricultural Society in 1859, which, like so much of his public sayings, is applicable to all time—as true

(Concluded on page 8)

THE ORIGINAL
2-WHEEL TRACTOR
That Does All Farm Work
WITHOUT HORSES

WHEN you begin to consider the purchase of a tractor, whether for a farm of 80 acres or more, there are a number of questions you will need to ask yourself before you buy. Here are some of them:

—Will it CULTIVATE as well as plow? Will it do ALL my farm work without horses? Will it work on plowed ground without packing the soil? Will it do the work quicker; easier; and save on hired help? Is it really a ONE-MAN tractor? Will it handle as easily as a team of horses, rather than be too heavy, clumsy and inconvenient? Do I ride on the tool where I can see the work I am doing, or will I have to have someone run the tractor while I am operating the farm implement?

Here is the tractor that answers these and all other farm power problems of the average farm most practically and profitably. A tractor that is heavy enough to do all farm work that horses will do, yet light enough to be handy and work on plowed ground without packing your soil.

MOLINE ORIGINAL 2 WHEEL

UNIVERSAL TRACTOR

This is the original Two-Wheel Farm Tractor. It pulls two 14-in. plows; will disc, harrow, plant, CULTIVATE all hill and row crops, pull mower, binder, manure spreader, fill your silo—and do all belt work on the average farm. In fact, it will do anything you can do with horses; do it quicker, easier; and with less hired help. It weighs only 2800 lbs., but all its weight being on its two wheels—*all its weight is traction weight.* The tool you hitch it to forms the rear wheels and you do not have to pull around a ton of needless weight. It will back up with tools attached easier than a team will back. You can turn around in a small space; get close to the rows and the fences.

Write for Catalog Folder and read how farmers everywhere are solving the power and hired help problems on their farms.

MOLINE PLOW CO. Dept. 30 Moline, Illinois

The Moline Line includes: Corn Planters, Cotton Planters, Cultivators, Corn Binders, Grain Binders, Grain Drills, Harrows, Hay Loaders, Hay Rakes, Lime Spreaders, Mowers, Manure Spreaders, Plows, (Chilled and Steel), Scales, Seeders, Stalk Cutters, Farm Trucks, Vehicles, Wagons.

Also STEPHENS SIX Automobiles

CURRENT EVENTS

CONSTANTINE I, King of Greece, was forced to abdicate, in favor of his second son, Prince Alexander, last week. The action was taken on the peremptory demand of France, Great Britain and Russia, the powers which protect Greece. The main reason for the action was that Constantine has long leaned toward Germany, his wife being the favorite sister of the kaiser. The allies have a large army stationed in Greece, but they could not send this army on any extended campaign against the Teutons as long as an unfriendly Greece government and army were in their rear. The crown prince was not acceptable to the allies, inasmuch as he, too, is favorable to the kaiser. The second son was acceptable and he was made king. Constantine had been king of Greece for four years, following the assassination of his father and during his reign had doubled Greek territory, as a result of the Balkan wars. Both Constantine and the crown prince intend to leave the country immediately. It is reported that they will embark on a British warship and proceed to Switzerland by way of Italy. It is presumed that Prince Alexander will take up his kingly duties with full acceptation of the ideas which the protecting powers desire to be put into effect in the government of Greece during the present war. He is twenty-four years of age and has been free from antientente proclivities. Affairs in Greece, which several times since the outbreak of the war had seemed on the verge of settlement, recently have taken on such an aspect of uncertainty that it became necessary for the powers to act with decision.

GENERAL PERSHING, who is to command the United States army in France, in support of the allies, reached Paris last week and was given an enthusiastic reception. He is accompanied by forty-six American staff officers, fifty-nine military clerks and sixty-seven American enlisted men. Their duties are to prepare the way for the coming of the first units of the American army, which will doubtless reach France some time in August or September. In a public statement, issued upon reaching France, General Pershing said: "We are the precursors of an army that is firmly resolved to do its part on the continent for the cause the American nation has adopted as its own. We come conscious of the historic duty to be accomplished when our flag shows itself upon the battlefields of the old world. It is not my role to promise or prophesy. Let it suffice to tell you we know what we are doing and what we want." General Pershing led the troops which went into Mexico on Villa's trail. He is an experienced commander and has the honor to have the most important command given to any American officer since the civil war.

GERMANY is responsible for a most barbaric air raid upon the east end of London last week a raid which exacted a frightful toll of life among women and children. Fifteen German airplanes and Zeppelins sailed over the poorer and more congested section of London, dropping bombs on the helpless people underneath. A dispatch from London gives this description of the partial result: "The bombing of a schoolhouse furnished one of the most pitiable scenes in the whole raid. The bomb struck the roof squarely, cutting clean through and passing through two classrooms, one above the other, killing some children, but sparing the majority. It finally exploded with terrific force in a room on the ground floor where there were sixty-four little children from five to seven years of age, ten of whom were killed outright and all the others more or less injured. Some of the babies had arms and legs torn off, others were shockingly lacerated, some stunned and others buried in the wreckage. The room was filled with the screams and moans of the tiny sufferers, many of whom were crying distractedly for their mothers. Many of the children were lying limp and helpless across the shattered desks, bleeding from terrible wounds. Others were writhing in pain and some bodies were unrecognizable." It is little wonder that such inhuman air raids have enraged England as has nothing else during the three years of the war.

THE government has been given control over exports by congress. The measure, as finally passed, puts into the hands of the president a weapon by which it is intended to stop supplies from entering Germany through neutral countries. Passage of the bill removes to a great extent the necessity of the British blockade, since the United States originates most of the exports that reach the neutrals, and will be in position with the aid of British machinery established during the three years of the war to see that the countries are supplied with just enough food and materials for their own needs. The measure also permits the president to trade for articles controlled by the allies, which heretofore have been permitted to come to America only in limited quantities. The United States, with an enormous trade balance in its favor and largely independent of the rest of the world for raw supplies, can force release of the supplies it does need by exercising its new power over exports. Fair control over shipping will result. As administered the act will require licenses for export cargoes and under this arrangement the government can force neutral ships from harbors where they have sought safety from submarine attack into service to transport cargoes wanted by the home countries. American and allied shipping, too, can be required to carry cargoes to the destinations the government considers should be supplied for a proper conduct of the war.

AN air fleet beyond the wildest imagination of the men fighting in Europe is to be constructed and operated by the United States. This is to be one of the powerful contributions of this country to the allied effort to bring the imperial German government to terms. Congress is to be asked by the war department for $500,000,000 for the immediate construction and operation of airships. Before the expiration of a year an additional sum of $500,000,000 may be asked. With such a large amount placed at its disposal the war department will be able to build two fleets of 50,000 machines each. If any such number of fliers could be mobilized on the European battlefield victory would be assured promptly, according to representations made by British and French officers. In the first place, the German machines would be driven out of the air. The effect would be to blind the German army. Their artillery could not be used effectively, since there would be no signaling planes to tell them whether their projectiles were falling properly. Air raids upon France and England would not be possible. On the other hand, the American airships would be assisting the allied artillery and could drop a perfect hail of bombs upon the German trenches and thus enable the infantry to attack with comparative safety.

REPORTS have been current for several weeks past that both Russia and Austria are tired of the present war and are seeking separate peace. Austria is known to be a disappointment to Germany and would probably relish an end to hostilities, from which it has suffered grievously. Russian conditions are chaotic today, at best. The country needs an autocrat to rule it, but the right man has not yet come forward. Revolution has followed revolution until things are far from settled. Direct overtures for peace were made by Austrian commanders recently to the commanders of the Russian armies opposing them, but nothing came from them. According to press dispatches, one of the Austrian commanders, General Rohr, selected two peace delegates from every division of Austrian troops on his particular part of the front—120 men in all. The delegates, according to papers in possession of the Russian war office, included an Austrian prince. These 120 Austrians, bearing white flags and blowing bugles, advanced to the Russian lines—the Russians respecting the white flag and meeting the enemy unarmed, in front of the trenches. There the Austrian spokesman outlined the plan for a cessation of hostilities, without waiting for governmental action. "If you want peace, go to Petrograd," declared the commander of the Russian troops. He forbade his men further discussing the matter and sent all of the Austrians except the prince and one other under a military escort back to the Austrian lines. On the two Austrians detained, the Russian war office declared, were found papers including orders for every Austrian regiment to effect a peace agreement with the opposing Russian regiments.

PRESIDENT WILSON has sent a communication to the Russian people which admirably sets forth the position of the United States in the great world war. The president has made it plain that the United States will insist upon the following: "No territory must change hands except for the purpose of securing those who inhabit it a fair chance of life and liberty. No indemnities must be insisted on except those that constitute payment for manifest wrong done. No readjustments of power must be made except such as will tend to secure the further peace of the world and the future welfare and happiness of its people." The president has likewise made it plain that peace will not be agreed to if that peace merely restores the conditions which existed before the war broke out. He said: "Of course, the imperial German government and those whom it is using for their own undoing are seeking to obtain pledges that the war will end in the restoration of the status quo ante. It was the status quo ante out of which this iniquitous war issued forth, the power of the imperial German government within the empire and its widespread domination and influence outside of that empire. That status must be altered in such fashion as to prevent any such hideous thing from ever happening again. We are fighting for the liberty, the self-government, and the undictated development of all peoples, and every feature of the settlement that concludes this war must be conceived and executed for that purpose. Wrongs must first be righted and then adequate safeguards must be created to prevent their being committed again." Great Britain has announced that it concurs in the president's position and will work in conjunction with him to bring about peace upon such terms.

The Bottom Is the Heart of the Plow

It is the hard working and essential part of any plow. All the rest of the plow is built merely to enable the bottom to do its work. That is why the bottom should be designed and constructed exactly right. Upon it depends the value of the entire plow.

The right kind of plow bottom makes money for you—it lays the foundation for the right kind of seed bed. The crop yield is increased. The plow lasts longer—a saving in actual cost. It pulls lighter—a saving in horseflesh, power and trouble.

John Deere Moldboard Tractor Plows

Have the Famous John Deere Bottoms

The bottom on every John Deere plow is correctly designed—John Deere plow success is largely due to bottom construction. It is the result of eighty years experience.

John Deere tractor plows can be used *with any standard tractor.* The hitch has a wide range of adjustment.

They make one-man tractor plowing outfits. A pull of the rope by the man on the tractor lowers or raises the bottoms high and level, and the tractor does the work. Does not gather trash when turning or being transported.

John Deere Light Tractor Plows *can be backed up*—they have a stiff hitch.

John Deere Quick Detachable Shares the greatest time and labor savers ever devised for a plow, *save eight to thirty minutes changing each share,* and the change is easily accomplished. No danger of skinning your knuckles or bruising your arms.

John Deere tractor plows can be furnished with John Deere combination rolling coulters and jointers, the greatest improvement in plows since John Deere Quick Detachable Shares were developed. These jointers result in better pulverizing of the soil, turn and cover all weeds, and make plowing easier.

Two, three or four bottoms.

Write for free booklet.

Thoroughly Disc Before and After Plowing

After the grain has been cut from your fields and before the hot August and Septembersun has cracked the ground, allowing the subsoil moisture to escape, use the

John Deere Model B Disc Harrow

Noted for Thorough Disking

It produces a fine dirt surface mulch that *stops evaporation* of moisture and *catches and holds rainfall.*

Mixes stubble, trash and weeds thoroughly into the soil. *Checks weed growth. Pulverizes surface thoroughly—ground is kept mellow—plowing is made easier.*

Using the Model B after plowing completes a seed bed that is *thoroughly pulverized through* and *through*—no clods—no air spaces—*seed bed fits the subsoil perfectly.*

The Model B is *exceptionally flexible*—that is why it disks so thoroughly. The spring pressure third lever assures uniform penetration regardless of dead furrows or ridges.

Write now for free booklet on this profitable disc harrow.

Big Book Free

Better Farm Implements and How to Use Them

America must produce more food. Labor-saving implements will play an important part in increased crop production.

This book tells all about a full line of labor-saving farming implements. Tells how to adjust and operate many of them. A practical farm implement encyclopedia. Worth dollars. Illustrates and describes the following machines: Walking and Riding Plows, Tractor Plows, Disc Plows, Disc Harrows, Spring Tooth and Spike Tooth Harrows, Corn and Cotton Planters and Drills, Listers, Alfalfa and Beet Tools, Grain Drills and Seeders, Riding and Walking Cultivators, Lister Cultivators, Mowers, Side Rakes, Loaders, Sweep Rakes and Stackers, Hay Presses, Grain and Corn Binders, Corn Cutters, Stalk Cutters, Kaffir Headers, Manure Spreaders, Portable and Inside Cup Elevators, Corn Shellers, Wagons, Farm Trucks and Buggies. This big book will be sent *FREE* if you state the implements in which you are interested and ask for Package X-640.

You Are Interested

in farm implements that save you money. The dominant idea back of the manufacture of John Deere implements is to produce tools that are economical. This means durability, easy operation and GOOD WORK.

The name "John Deere" on an implement means that these qualities are embodied in that tool

JOHN DEERE, MOLINE, ILLINOIS

Polk County Federation Meeting.

(Continued from page 6.)

today as when it was spoken nearly sixty years ago. He said:

"Farmers as a class are neither better nor worse than other people, but their interest is the largest interest. It also follows that that interest is most worthy of all to be cherished and cultivated, and if there be inevitable conflict between that interest and any other, the other should yield."

Those words were uttered under conditions somewhat similar to those we face today, when the war clouds were lowering and the storm was almost ready to break. The martyred president, with characteristic far-sighted vision, saw that between organized capital and labor the farmers of the country were in danger of being ground, as between the upper and the nether millstones, and he sounded this note of solemn warning that their interests—the largest which exist in this country—should be carefully guarded. To accomplish better laws, better public institutions and an honest, wise and economical expenditure of the tax funds to which they are the principal contributors, the farmers of Wisconsin must stand together in giving battle to the common enemy to whom neither party principles nor the common welfare mean anything, as compared with office holding and the perquisites of office holding. The example of the embattled farmers of North Dakota in rallying around a single standard, without regard to partisan lines, in the last election and carrying all the state offices from governor down on a platform of a square deal to the farmer-taxpayers is an inspiring illustration of what can be accomplished by united effort along political lines. It is a potent influence which is leavening the whole lump throughout the grain belt. The farmers of Minnesota and Iowa have caught the spirit of it and are coming into their own in state affairs. I am proud to believe that honesty, economy and efficiency in public office has been the rule rather than the exception in Wisconsin. In fact, I believe that Wisconsin is the best governed state in the Central West, if not in the country, but I also believe that eternal vigilance is the price of safety, and that greater interest and participation in public affairs, along non-partisan lines, by the farmers of our state will insure even better government than we have ever enjoyed.

I am sure that I do not need to elaborate on the social value of such splendid organizations as yours is. You have discovered that as you have gone along, and I am sure that such gatherings as this, where you meet and exchange ideas with your neighbors, perhaps many miles removed, whom you might not otherwise know, have been and will be increasingly productive of greater breadth of vision, more sympathetic understanding and of mutual pleasures. If there is any class of citizens of this great land of ours that are entitled to the very best which can be provided for them, it is the farm women of America. They are indeed "the mothers of the race," for the typical American is not the city-pampered man, woman or child. It is the farmer that is the real typical American, upon whose shoulders rests the basis of the country's most substantial and enduring prosperity. Such as they are the real bone and sinew of the land. It will be a sad day for America if the farmer, the pioneer going out onto the broad prairies and breaking the virgin soil or clearing away the forests with his woodman's axe, ceases to be the model of the virtues of the race. Surely, then, the companion of his joys and sorrows, his labor and his reward—the farm wife and mother—is entitled to the best that their means afford in adding to her pleasures and lightening her burdens. Surely she is entitled to full partnership in the firm to whose success she has been so faithful and liberal a contributor.

As I think of these things and realize how much Wisconsin owes to those fathers and mothers of men, who laid so well the foundations of this great commonwealth, my mind goes back over the years and dwells in loving reverence on the pioneers. With my mind's eye I see them as they came west, rank by rank, from eastern states, from foreign lands, each making its contribution to the development of this state and each leaving its share of the inheritance for us to enjoy. Here within our borders all these streams of population coalesced into one and when they rolled on, wave after wave, across the mighty Father of Waters towards the setting sun, it was not as New Englanders, Southerners or Middle States men—not as Scandinavians, Germans, Englishmen or any other nationality, but as citizens of Wisconsin, bearing aloft wherever they went the torch of good citizenship. Thus in a very real sense was Wisconsin the melting pot of the West, and today, as never before, this fact is showing itself in loyal patriotism to the stars and stripes—to your flag and mine—the flag of our common country, no matter from whence we came or what our parentage.

When I think of the trials and hardships of those days—for the winning of Wisconsin and the West was a struggle, my friends, that demanded as great heroism as the struggles of the battlefield—I say that when I think of all it cost in hardship and toil and suffering to make Wisconsin the state we enjoy today I am both humble and proud—proud of the rich inheritance which we have receivd and humble to think how much of it we owe to others. It behooves us to guard well this heritage, my friends, and to add to it where we may, that we may pass it along to our children and our children's children without a taint upon its honor or a check on its further development.

For I believe that an even brighter day is dawning for Wisconsin and for all America. The clouds that involve our land just now will but make the sun seem brighter when the clouds roll by, as they surely will. I believe that the day is coming surely, if slowly, when war shall be no more and the earth's brotherhood will beat their swords into plowshares and their spears into pruning hooks; when the farmers, not only of Wisconsin, but of the whole nation, will come into their own and enjoy a fuller measure of all the good things of life than ever before. In the dawn of that new day I am sure that you members of the Polk county federated clubs will play your part of good citizenship courageously, willingly, and patriotically, so that you may hand on to generations yet unborn the splendid heritage which you have received in all its glory.

In conclusion, I want to thank you for giving me the honor of being represented on your program by this paper and to express again the regret I feel over not being with you in person as I am in thought today, with the hope that the privilege may be given me on some similar occasion in the near future to meet you all face to face and enjoy your hospitality.

In the meantime, let me assure you of the loyal support and coöperation of The Wisconsin Farmer, at any and all times, in promoting the things in which we are mutually interested. Whenever I may serve you in any capacity, all you need to do is to command me, confident that it is my highest ambition to make my paper increasingly worthy with every passing year of the support of such splendid Wisconsin farmers' organizations as the federated clubs of Polk county.

Wisconsin Crop Report.

Brown County.—Weather has been rainy and cool, but is warming up. Wet land is drying out and corn and potato planting is nearly finished. Meadows and pastures are making fine growth. All crops are late—grain looks fair, especially the early sown. The milk supply furnished to the cheese factories is large and brings the farmer from $1.90 to $2 per 100. Condensories are also paying good prices for milk. Farmers are not taking much interest in horse breeding this year.—S. J. Shannon.

Crawford County.—Crops are held back by continued cold weather and rain. Hail did considerable damage to rye in some districts. Oats, wheat and barley look fair. Corn is planted and most of it has been cultivated once. Potatoes and other garden truck are doing well in some localities, but in other places they are not so good. Fruit prospects are favorable. Meadows do not show up favorably at this time.—H. H. Stuckey.

Douglas County.—Because of the dry spring, hay will be short on old meadows. Recent rains may improve the new seeding. Small grains are backward on account of cold weather and occasional frosts. This year's grain acreage will exceed last year's by 25 per cent. Little corn will be planted, but root crops will be increased. Gardens are backward, but fruit promises well. Young stock look well; all stock in good or medium flesh are being picked up by local buyers.—B. N. Stone.

Dunn County.—Rainfall is plentiful. Hay and small grains are coming fine. Corn is backward. Pastures are good. Young stock are doing well. Dairy cows are not up to normal in production because pastures were late. Young chickens are few in number and hens are not laying well. Potatoes are nearly all in the ground. Cutworms have been at work on gardens and corn.—Jas. A. Smith.

Iowa County.—Last two weeks have been cold and wet, but nevertheless served to make a good hay crop and start the pastures and small grain. Corn is about two weeks late and the stand is 90 per cent normal. Favorable weather is needed to kill weeds. Garden stuff is late, but looks well. Rainy weather decreased the milk flow, but prices are high and farmers are not complaining. Factories pay from $1.90 to $2.05 a hundredweight for milk. The acreage of all grains is above normal.—Art G. Hoskins.

Jackson County.—Because of the cold spring, rye and winter wheat will be below normal. Weather now is warmer and moisture is plentiful. Spring crops look fine. Hay and pastures are fine at present. The acreage of oats is about 10 per cent above normal, corn 15 per cent and potatoes 20 per cent. Live stock are in fine condition.—C. S. Ristow.

Juneau County.—The acreage of small grain is about normal, but there is an increase of 25 per cent in the land put in corn and potatoes. Small grains have a thin stand in some fields. Vegetation is backward, but the last few days have been more seasonable and will stimulate it. Pastures are progressing. Live stock are in good condition.—C. W. Hale.

Marquette County.—Weather is cold and rain abundant. Oats are improving. Rye will not make half a crop; pastures haven't grown well on account of cold weather. Both young and old clover are doing fine. Most of the corn is planted and the acreage is about 20 per cent above normal. Potato seed is very scarce so that the acreage of this crop is not more than normal. Almost 40 per cent more land will be devoted to beans than usual in spite of the fact that seed is worth $11 a bushel. Strawberries promise a heavy yield. Young pigs are scarce and high priced. All stock are healthy.—J. M. Williams.

Pierce County.—Recent rains which fell here were badly needed. Most of the spring grain looks well. Rye and clover are good. Pastures are improving. Corn is rather backward on account of the cold weather. Most of the tillable land in this county is already under cultivation and therefore little increase will be made this year.—G. K. Moore.

Polk County.—Everything is growing fine, although the weather is still cool. The hay crop will be somewhat short, but small grain and corn never looked better. Early potatoes are doing nicely. Although bean seed is worth $15 a bushel, a large area will be planted to this crop. The pig crop is below average. Cattle are about normal and show improvement since grass started up.—P. F. Amery.

Portage County.—The acreage of small grains is about 10 per cent greater than last year. The acreage of potatoes and corn is about normal. On this soil oats are rather backward. Corn is up and looks well. Hay and pastures were slow, but recent rains and warm days have pushed them forward. Live stock are in exceptionally good condition. About 15 per cent more dairy heifers are on pastures this year than last.—Arthur H. Peterson.

Taylor County.—All crops are backward on account of cold weather. The oat crop will be good if conditions are favorable from now on. Rye will make about 75 per cent of a crop. Barley will be normal. Potatoes are not up yet; more were planted than last year. Fruit will not yield well on account of hard frosts. Garden truck is not yet out of the ground. The hay crop may be short. Pastures are late and many farmers are still feeding hay. Live stock look well.—J. C. Hoffman.

Washburn County.—Good rains during the first week in June greatly improved the crop prospects. Pastures are fairly good and meadows promise a fair crop of hay. Oats, spring wheat and barley are up to the average, but rye is thin. Nearly all potatoes have been planted and the acreage is greater than normal. Live stock are healthy. Spring pigs are scarce and selling at high prices.—L. D. Garnhart.

Washington County.—Because of heavy rains and cold weather, crops are not as far along as they should be. All winter crops are doing well, but barley and oats are not in good condition. The hay crop is excellent. Alfalfa will soon be ready to cut. Spring wheat is scarce, but the prospects are

(Concluded on page 13.)

The Price of Lumber

Now is the time for the farmer, above all others, to build! He has the job of feeding *the world* and he needs more buildings, more granaries, more dairy houses, hog houses, poultry houses than ever before.

At the same time, by good fortune, his bushel of grain, his ton of hay, his pound of butter-fat **will buy more lumber than ever.** Compared with the prices of other things, "Old Faithful"

HEMLOCK Is Cheap Now!

Many things have gone up more in one year than "Old Faithful" HEMLOCK has gone up in ten years, and nothing has done much better for its producers than farm products. The Farmer is pretty nearly President of the World today. So don't forget that you buy your lumber not with dollars but with what you raise.

Build what you need now of "Old Faithful" HEMLOCK and you get a BARGAIN.

Tell us what you want to build, give your lumber dealer's name and we'll give you experts' working **PLANS FREE.**

Good Power

GOOD strong power is just as essential as any other feature of a threshing outfit. It is impossible to do a good job of threshing without steady and even motion, and a strong, well-built engine is necessary. The *Nichols-Shepard Steam Traction Engine* has the strongest and best built boiler ever used in traction engine building.

The double-cylinder engine boilers do not have a bolt, stud-bolt or cap screw that goes through the shell into steam or water space. It steams easily—is powerful in the belt, runs steadily during the entire season. All Nichols & Shepard Engines are members of the

Red River Special Line

With the Red River Special threshers, they make a combination that is sure to save the farmer's thresh bill.

Write for big, free catalogue and read why the Nichols-Shepard Engine excels all others. The most profitable for both threshermen and farmers. Write for description of anything in Threshing Machine Line desired.

The Fight on Hog Cholera.

(Continued from page 1.)

self. Begin at once to disinfect his former sleeping quarters, so as to destroy any infection that may previously have been scattered. If a second ailing hog appears, get him into the isolated pen without delay, also. A visit from an experienced veterinarian at such a time may result in saving practically all the hogs that are still on feed. If the trouble is diagnosed as cholera it is then time to get busy with the serum.

Every swine breeder who finds that he has cholera in his herd should endeavor to control it in the manner here described and, in addition, he should take steps to protect his neighbors' hogs by placing upon his own premises a self-imposed quarantine. This means that sick hogs that are likely to recover must be kept in close quarters with no access to yards or pastures. It means a thorough cleansing of the yards that have previously been run over by infected hogs, and it involves taking out all manure and trash and scraping the surface down to bare Mother Earth. After this, careful disinfection is absolutely essential. Troughs should be turned over and drenched and every hole and corner that is not exposed to the direct rays of the sun should be thoroughly disinfected. The infection in the open yards and fields, when filth is once removed, soon disappears, but it may remain for a twelve-month period in filth. It follows, naturally, that where yards are cleaned and disinfected, and where sick hogs are kept confined to a single pen, that the disease cannot spread. Simply remember that the body discharges of diseased hogs scatter hog cholera, and when there is no means of coming in contact with these, then infection cannot spread.

Recently, attention was called to a case where two hogs in a herd of eighty showed signs of cholera. A veterinarian was called and failed to recognize the disease, but pronounced it enteritis. No attempt was made to immunize the herd against cholera. One by one the hogs in this herd sickened and not until sixty head were lost was the disease pronounced cholera. The loss in this case amounted to more than $1,000. The owner was in part to blame, as the first diagnosis was made by the veterinarian before there were clearly defined marks of cholera. It should have been followed up with a second examination, when there would have been marked evidence of the presence of real cholera. The remainder of the herd could have been treated and the chances are that the loss could have been cut down to $100, or not to exceed $200, even including the price of treatment.

Of course, there are many things to contend with in this fight to stamp out the much dreaded disease. Instances can be found in every county where serum has utterly failed, and cases can be pointed to where a herd of healthy hogs has been wiped out after treatment. Men who have sustained such losses are dubious about the government's plan, and well they might be. However, swine breeders should be broadminded enough not to judge the entire situation by their own personal experience. Serum will not immunize against pneumonia. Indeed, a herd badly infected with pneumonia, when treated with serum, will die off even quicker than if they were let alone. Sometimes veterinarians make an incorrect diagnosis. They are human and, like men in other professions, will make mistakes, but this does not justify swine breeders in condemning all veterinarians. If hog cholera is ever combated it will be the result of coördinate effort of breeders and veterinarians. Remember that in many cases there is a mixed infection, and it is enough to baffle even the most skillful and experienced. Plain hog cholera, however, can be prevented by administering the right amount of good serum at the proper time. There are nostrums a-plenty on the market, but none of these will cure hog cholera and none will immunize an animal against disease. Anti-cholera serum is the only product that has ever been discovered that will do this, so why lose time in trying to coddle a sick herd along with patented dopes, herbs and concoctions of one kind and another?

If swine breeders would act promptly when disease makes its appearance and carry out the program outlined above and follow this up by exercising a little care when they leave their premises while the disease is on the farm, and if every animal that dies from cholera is promptly burned, it will be possible in a few years to absolutely stamp out the disease. Speaking of burning diseased animals, mention should be made of the fact that there is at the present time considerable carelessness along this line. Sixty-five cases broke out in four adjoining townships last year and in a few weeks the disease was entirely stamped out. In this case diseased carcasses were promptly burned, pens were cleaned and disinfected, special precautions were taken for a time, so as not to spread infection on the feet or by vehicle wheels, and the record of cleaning up this bad mess was made without the further spread of disease. In other words, it was confined, with the exception of two cases, to the herds in which it appeared before the campaign of eradication was started. Every man in this particular neighborhood placed his confidence in the ability of the officers in charge and he followed instructions to the very letter. At a comparatively small cost and with but little loss even in diseased herds, cholera that might have cost the farmers in this locality tens of thousands of dollars absolutely disappeared, and up to the present time not a single case of reinfection has shown up.

Every swine breeder should keep in mind the various agencies that are used in spreading cholera infection, and in doing this he will be the better able to protect his own herd and also to safeguard the interests of his neighbors. In 206 cases traced to their original source, it was found that the infection in sixty-one instances was spread as the result of visiting or exchanging labor between farms; four cases were due to the spread of infection from adjoining pens and pastures, and thirty-one outbreaks were traced to an infection that held over from a previous year. There were sixty-four outbreaks due to infection carried by dogs and in five instances disease was introduced by the purchase of new stock. Contaminated streams were responsible for six outbreaks and nine outbreaks were attributed to birds. In addition, there were twenty-five outbreaks that could not be accounted for, but the means of spreading here enumerated throws a good deal of light on the whole problem, and, if sensible precautions are taken to prevent any of these agencies from scattering infection, the problem of combating cholera would be greatly simplified and the loss from this disease very greatly reduced.

Department of Agriculture's Rules for Preventing Spread of Cholera.

LOCATE your hog lots and pastures away from streams and public highways, and do not allow your hogs to run on free range or highways nor to have access to canals or irrigation ditches.

Do not visit your neighbor's farm nor allow him to visit you if he has hog cholera on his premises.

Do not drive into hog lots after driving on public highways.

Do not use hog lots for yarding wagons and farm implements.

Do not place newly-purchased stock, stock procured or borrowed for breeding purposes, or stock exhibited at county fairs immediately with your herd. Keep such stock quarantined in separate pens for at least two weeks, and use care in feeding and attending stock to prevent carrying infection from these to other pens.

Burn to ashes or cover with quicklime and bury under four feet of earth all dead animals and the viscera removed from animals at butchering time, because they attract buzzards, dogs, etc., which are liable to carry hog-cholera infection.

If hog cholera appears in the neighborhood confine your dog and encourage your neighbor to do the same.

Mange, lice and worms lower the vitality of hogs, rendering them more susceptible to disease.

Have all hogs treated immediately with anti-hog-cholera serum, after which they should be kept on a light diet, with pure drinking water, and confined to limited quarters that should be cleaned and sprayed three times a week with "1 part of compound cresol solution to 30 parts of water," until the disease has abated in the herd.

To obtain the best results the serum must be administered as soon as the disease is detected in the herd. Be sure that the temperature of all hogs is taken. A temperature above 104 degrees F. in ordinary weather and when the animal is not excited indicates infection, and such hogs require an increased dose of serum.

Remove all manure and mix it thoroughly with quicklime.

Burn all litter, rubbish and old hog troughs.

After the premises are thoroughly cleaned, spray walls, floors and other surfaces, including remaining hog troughs, etc., with a disinfectant (1 part compound cresol solution to 30 parts water). Where hog houses are small, turn them over, exposing interior to sunlight. Clean premises, properly exposed to sunlight, will not retain infection any great length of time.

Wallow holes and cesspools should be filled in, drained, or fenced off.

All runs underneath buildings should be cleaned and disinfected and then boarded up to keep hogs out.

Destroy hogs that do not fully recover, as they may be carriers of cholera infection.

Good Hay-Makers All!

HAY fields without International Harvester mowers, rakes and tedders upon them at some time in the season, give you almost as strange a situation as hayfields without hay. That is how popular Champion, Deering, McCormick, Milwaukee, Osborne and Plano hay tools have been on thousands upon thousands of farms for seventy-five years.

Last year 40,000,000 American acres were mowed by mowers on each of which was one of these names. That means they are very good mowers. Just as good rakes and tedders followed. If your own hay making is not being done by hay tools chosen from these lines, at least it is certain that they are doing the work for the majority of your neighbors. This year there will be more than ever sold, and they will be better built than ever.

Choose an International Harvester mower, rake and tedder. That means good, easy hay making, long service, prompt repair service if you need it. Champion, Deering, McCormick, Milwaukee, Osborne and Plano—safe names in the haying season. Write us for a catalogue on any line. Get posted early.

Is Your Tractor Paying Dividends?

Is it doing its work all the time, or is it laid up frequently for costly repairs?

You can increase the efficiency of your tractor greatly by using the right lubricating oil.

When kerosene is used as fuel it is needful that an oil capable of withstanding high temperatures be used, if the bearings are to be kept cool and friction eliminated.

To meet conditions obtaining where kerosene is used as fuel we have designed a special lubricating oil.

Use Stanolind Gas Engine Tractor Oil

It is made by the Standard Oil Company of Indiana. It is the result of an extensive research for a lubricant that not only had the right viscosity but would hold it under the extreme heat produced when kerosene is used as fuel.

It is made especially for gas engine tractors where kerosene is used as fuel.

It is an oil of great durability and adds power and life to your engine.

It is equally efficient for stationary gas engines as well as for lubricating the bearings of all types of harvester machinery and heavy gearings of tractors.

Use Standard Gas Engine Oil

in tractors where gasoline is used as fuel. This oil also is an ideal lubricant for external bearings and may be used as a complete lubricant in the operation of your engine.

JERSEY MEETING AT MADISON.

Good Attendance and Keen Interest in All Addresses.

There was not a large gathering present at the meeting of the Jersey breeders held on June 14th in the stock pavilion at Madison preceding the promotion sale. However, those present had the benefit of listening to a number of excellent speakers.

Pres. F. F. Showers opened the meeting and reviewed briefly the progress that had been made since 1909. In that year there were only twenty-four cows doing official work, while this year more than 100 cows are on register of merit test. Mr. Showers urged retail dairymen so to advertise their product as to obtain a better price for higher testing milk. Jersey milk, according to him, is entitled to a bigger price than is being received by the Jersey men.

Dr. Eliason, state veterinarian, took occasion to warn against serious contagious diseases among cattle and stock at the present time. Vigilance is now of utmost importance. The doctor urged everyone to nip in the bud any possible spread of disease by promptly reporting suspicious cases to the proper authorities. Previous experiences with diseases have proved the wisdom of this. He also touched upon the proposed legislation regarding tuberculosis. The doctor is not in favor of the radical means which have prevailed in the past and he has managed to put into the bills now about to be enacted into laws features which will make it considerably easier for the farmer who has the ill fortune to find tuberculosis present in any one of his cows, to readjust his business with a minimum of loss.

Dean Henry, formerly at the head of the agricultural college of the university, was also on the program. We all know what Dean Henry has done for Wisconsin agriculture. His wonderful book, Feeds and Feeding, is undoubtedly the most authoritative and exhaustive book on this subject. He called attention to the difficulty encountered in former years in making breeders see the value of pedigrees. Today the cow without a recorded ancestry cannot very well expect to sell for a fancy price and breeders are very slow in investing their money in such animals. Dairying, according to the dean, keeps us out of trouble by reason of the hard work connected with it, but it also pays us well for this hard work.

Professor Humphrey, of the animal husbandry department of the college, made a strong plea for a greater state association to carry the gospel of the Jersey cow into every county of the state. There is room for more pure-bred cattle in Wisconsin and there is room for good Jerseys in Wisconsin, but a state association is essential to the success of their distribution among such farmers as have not yet decided on the dairy breed with which they wish to work. Nineteen county associations are at present alive in Wisconsin and the Jerseys have made some showing and received considerable help through these bodies. They have also shown up well in the various cow-testing associations, of which there are now seventy-eight in the state.

A "Cow Demonstration" by Hugh G. Van Pelt, owner of Waterloo Jersey Farm and director in the American Jersey Cattle Club, ended the program. Mr. Van Pelt pointed out the five essentials which are necessary for the cow to have in order to produce large quantities of milk. By using a cow to illustrate his points the talk proved to be of greater value than a mere lecture on the subject. The five essentials, according to Mr. Van Pelt, are constitution, capacity, nervous temperament, blood circulation and udder development.

St. Croix Guernsey Meeting.

The sixth annual picnic of the St. Croix County Guernsey Breeders' Club was held at the H. A. Rundell farm. Officers for the coming year were elected as follows:

President—Lloyd Rundell.
Vice President—Hiram Rundell.
Secretary and Treasurer—Oscar Schwallen.

W. H. Phipps, of Hudson, explained the Liberty Loan Bond and District Attorney W. T. Door gave a patriotic address. Another speaker, Professor McKerron, of the University of Wisconsin, spoke on the value of community activities. T. M. Olson, the new county agent, gave a splendid talk on his work. It was decided to hold a winter meeting at Hudson and make the meeting a combination breeders' convention, inviting the representatives of other breeds to participate. County Agent T. M. Olson, of St. Croix county, and J. S. Klinka, of Polk county, were in charge of the high school boys' judging contest with entries from both counties. Prof. H. M. Stevens, of New Richmond, and Mr. Christianson, of Roberts, had charge of the grade judging contest. Percy Reed, of New Richmond, and George Larson, of Frederic, tied for first place with a total of 187 points each and the first and second money was divided between them.

The Pierce County Guernsey Picnic.

Talks on alfalfa, cow-testing associations and praises for the Guernsey cow were the high spots in the Pierce county Guernsey picnic held by the breeders' association of that county on June 12th. The E. P. Bjerkeng's farm near Ellsworth was selected for the picnic and the attendance was large.

A stock-judging contest in which Ed Wild, of Elmwood, won first in the men's division, proved quite a success. Mr. Wild not only placed the animals correctly but estimated their annual production within a few pounds of the actual figure. For his good work the association granted him a free membership card. In the boys' contest W. Ingli, M. B. Krueger and Robert Shannon, of the Ellsworth High School, won first place. Robert Shannon is the same boy who won first in the state stock-judging contest at Madison last February. Second place in the boys' contest went to James Walker, of Roberts.

Chief speakers of the day were Prof. W. W. Park, of the Wood County Agri-

Kalamazoo ALFALFA & ENSILAGE CUTTERS

Before you buy an ensilage cutter, find out all about the *Kalamazoo*—the *only* cutter on the market having a center shear. The Kalamazoo has an unbreakable malleable knife *wheel*—not a knife cylinder. Two knives are constantly cutting toward *center*—absolutely no side-thrust. No wasted power. This center-cutting knife wheel delivers a steady, even flow of ensilage to the blower—clogging is absolutely impossible. Another big feature—

The Knife Wheel is the Blower Fan

You can't realize what a power saving this means until you see a Kalamazoo in operation. All wearing parts are easily adjustable. Cutting adjustment is on shear bar only. This makes adjustment of knives simple and easy compared with other cutters.

Get a Kalamazoo—save power—save cutting cost—feed your herd on less acreage. "Do your bit" by helping produce America's biggest saleable crop.

cultural School, who spoke on the Guernsey cow and the value of the test association from a financial and educational standpoint. Prof. Ralph Peterson, of the Ellsworth high school, gave several song selections and a patriotic talk in which he emphasized the importance of the farmer in helping in the present food crisis. Principal J. H. Hammer, of the Roberts Agricultural High School, spoke on alfalfa as the crop for greater dairy profits. He mentioned the various difficulties encountered in Pierce county in the growing of this crop and the remedies which would overcome a great many present failures. He mentioned especially the application of ground limestone for sweetening the soil and assisting the alfalfa in its fight for a stand during the first months.

At the business meeting held in the afternoon the new officers were elected. For the coming year they will be: President, George Wild, of Elmwood; vice president, Gust Grossman, of Elmwood; secretary, Melvin Hammer, of Spring Valley, and treasurer, Russel Rudesill, of Baldwin.

La Crosse County Celebrates Guernsey Day.

To the Editor:—La Crosse county, on June 8th—Guernsey Day—classified as one of the great Guernsey centers of the country. Never before did the owners of more than 150 pure-bred Guernsey sires in the county have an opportunity to show the results of their breeding efforts. To say that they took advantage of their opportunity is putting it mildly. Guernsey dairy kings and queens were there from all parts of the county in numbers. Breeders for a distance of nineteen miles brought animals. By ten o'clock more than eighty choice animals graced the show pavilion. Twenty-eight cows made up the aged cow class. Promptly at 12:15, headed by the West Salem band, eighty magnificent Guernseys were marched through the streets of the village and the first Guernsey Day in the United States was inaugurated.

The occasion attracted more than 500 people. Farmers came from all parts of the county and many from neighboring counties were present. City folks turned out in numbers. Everyone was interested in the sleek Guernsey cattle exhibited, the stock judging, games and speeches, which marked the day.

Vilas Young, West Salem, carried off the silver cup in the boys' calf contest in a hotly contested event, in which Irvine Nuttleman, West Salem, finished second with Claude Bonsack, Brice's Prairie, third.

Emil Miller was rated the best stock judge among the farmers who competed. Other honors awarded were:

Aged pure-bred cows—Emil Miller, Barre; Ray Lewis, West Salem; Clinton Griswold, West Salem.

Aged grade cows—Mrs. Michaelson, West Salem; Richard Wehrs, West Salem; Howard Aldrich, West Salem.

Cows, two to three—Ludwig Lee, Holmen; Otto Wolf, Barre; Hiram Lovejoy, West Salem.

Cows, one to two—Mrs. Michaelson, West Salem; H. D. Griswold, West Salem; W. D. Sandman, Holmen.

Cows under one year—Ray Lewis, West Salem; Ed Young, Barre; H. M. Bonsack, Brice's Prairie.

Aged bulls—H. D. Griswold, West Salem; Adolph Nuttleman, West Salem; Otto Wolf, Barre; Ray Lewis, West Salem; Emil Miller, Barre.

Yearling bulls—K. O. Gaardner, Holmen; Wiilliam Behnub, West Salem; W. H. Meyer, Bangor.

Hills of the Guernsey Cattle Club of America was present and assisted Prof. G. C. Humphrey in the judging.

Professor Merrill gave a splendid address on the opportunity of the farmers of today. T. H. Campion.

Cow-Testing Reports.

Reedsburg Association.

To the Editor:—I enclose a list of the 45-pound cows in the Reedsburg association for thirty-one days, ending May 9th. For the third consecutive month Helena of Wayside, a seven year old belonging to Kirkpatrick Brothers' herd of registered Holsteins, leads the association in number of pounds of butter fat. The cow giving the most pounds of milk was also a grade Holstein belonging to F. J. Hilmer. E. A. Wood's herd of grade Holsteins averaged 41.06 pounds butter fat.

Levi Brunson, Secretary.

You Need a New
DE LAVAL
SEPARATOR
NOW

1st If you are still using some gravity or setting process of creaming—

BECAUSE YOUR WASTE IS greatest and quality of product poorest in mid-summer when the milk supply is heaviest.

BECAUSE TIME IS OF GREATEST value on the farm at this season and the time and labor saving of the good separator counts for most.

BECAUSE THE SKIM MILK IS poorest without a separator in hot weather and often more harmful than helpful to calves.

BECAUSE THE WORK OF A NEW De Laval Cream Separator is as perfect and its product as superior with one kind of weather as with another.

2nd If you have a very old De Laval or an inferior separator of any kind—

BECAUSE THE LOSSES OF THE poor separator from incomplete skimming and the tainted product of the hard-to-clean and insanitary separator are the greatest at this season.

BECAUSE OF THE GREAT ECONOMY of time at this season in having a separator of ample capacity to do the work so much more quickly.

BECAUSE THE NEW DE LAVAL IS so much simpler and more easily handled and cared for than any other, and you cannot afford to waste time these busy days "fussing" with a machine that ought to have been thrown on the junk pile long ago.

BECAUSE THE DE LAVAL SEPARATOR of today is just as superior to other separators as the best of other separators to gravity setting, and every feature of De Laval superiority counts for most during the hot summer months

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer. If you don't know the nearest De Laval agency simply write the nearest main office, as below.

THE DE LAVAL SEPARATOR CO.

Calf Rennets
We pay 25c for salted Rennets from milk-fed calves if handled according to directions. The Marschall Dairy Laboratory, Madison, Wis.

THE HOME

Letters intended for publication should be accompanied by the name and address of the writer, not necessarily for publication, but as a matter of good faith. All communications intended for this department should be addressed to Editor Home Dept., Wisconsin Farmer, Madison, Wis.

THE HOME WOMAN'S DUTY.

While all honor is due to the women who leave their homes to nurse and care for those wounded in battle, no woman should feel that, because she does not wear a nurse's uniform, she is absolved from patriotic service. The home women of the country, if they will give their minds fully to this vital subject of food conservation and train themselves in household thrift, can make of the housewife's apron a uniform of national significance.—Department of Agriculture.

Another Way to Help.

Knitting needles are going to do their part to help win the war if only willing women can be found to ply them. A marching soldier wears out one pair of socks a week and millions of pairs are needed for the army now being equipped for the war, so many millions that, even with all the output of the factories, we are going to fall short unless the women of America begin to knit as the women of England and Canada are knitting. "It cannot remain merely a matter of the commissary department of the army," says a Red Cross worker, "where the demand cannot be supplied. It must become a personal matter, with every woman knitting for some American soldier in her family or among her friends or among the thousands who have neither sisters nor mothers nor any other relative from whom they may expect personal kindnesses."

Directions for making the socks are as follows:

Eighty stitches.

Knit two plain, two purl for four inches.

Knit plain for two and one-half inches, narrow two stitches, seven rows plain, doing this for five times, and after fifth narrowing knit two and one-half inches plain.

Take off thirty-four stitches for heel and make double heel for two and one-half inches. Then turn heel.

Pick up twenty stitches on each side. Knit two together, evening off until you have seventy stitches left in all.

Knit nine inches from end of heel. Narrow every sixth stitch for one row, then knit five rows plain. Narrow every fifth stitch, then knit five rows plain, and so on, until six stitches are left. Then bind off.

If you are knitting socks for some particular soldier, then, of course, the exact size will be known; otherwise they should be of large sizes, and care should be exercised so that there will not be a ridge below the heel or at the end of the toe. Be sure that your needles are of a proper size for the wool you propose to use.

Here is a field where women can help wonderfully toward the comfort of our soldiers and we are sure there is not one woman in the country who is not willing to do her share.

Drying Fruits and Vegetables.

The present shortage of both sugar and containers makes drying an economical method of preserving food in the home. Many fruits and vegetables which are canned ordinarily may be taken care of in this way.

Drying may be done in the sun, by artificial heat, or before an electric fan. The only objection to sun drying is the uncertainty of weather conditions; a cloudy day before drying is completed may cause the product to sour. In sun drying the product may be placed on sheets of paper or muslin held in place by weights, or a drier may be used the same as for drying in artificial heat. If a drier is used the drying may be completed by artificial heat in case the sun fails during the process. Small driers may be purchased for from $5 to $15, but if one does not care to go to this expense a very satisfactory one may be made at home. A simple homemade drier consists of trays and a holder. Four strong, upright wooden supports connected by horizontal bars will hold several trays at once. Make the trays like window-screen frames and cover with cheesecloth or unbleached muslin, or, if desired, one-fourth-inch galvanized wire mesh may be tacked to the side and end boards to form the bottoms of the trays. Frames for use with artificial heat should, of course, be made of noninflammable material to as great an extent as possible.

Food to be dried in the sun should be covered with mosquito net and the trays shifted often to promote drying. When the drying is to be done by artificial heat, as on the back of the stove, the supports on which the trays rest should be raised a few inches above the heated surface by means of pieces of metal or bricks. This permits a free circulation of hot air up through the trays and thus carries the moisture away from the products. As many as six trays may be placed in the frame when artificial heat is used. In drying before an electric fan the number of trays that may be placed one above the other will depend upon the diameter of the fan.

Shelled beans and green peas may be dried in this fashion as well as string beans, sweet corn and various other vegetables and fruits. Sweet corn should be slightly cooked, then cut from the cob and spread in very thin layers. Spinach that is in prime condition for greens should be prepared by careful washing and removing the leaves from the roots. Spread the leaves on trays to dry thoroughly.

The larger vegetables and fruits will dry better if sliced. They should be cut into slices one-eighth to one-fourth of an inch thick. If thicker, they will not dry thoroughly. While drying, the products should be turned or stirred from time to time.

Following are recipes for a few of the vegetables that must be sliced or chopped:

Beets.—Select young, quickly grown, tender beets, which should be washed, peeled, sliced about an eighth of an inch thick, and dried.

Turnips should be treated in the same way as beets.

Carrots should be well grown, but varieties having a large, woody core should be avoided. Wash, peel and slice crosswise into pieces about an eighth of an inch thick.

Parsnips should be treated in the same way as carrots.

Onions.—Remove the outside papery covering. Cut off tops and roots. Slice into one-eighth-inch pieces and dry.

Cabbage.—Select well developed heads of cabbage and remove all loose outside leaves. Split the cabbage, remove the hard, woody core, and slice the remainder of the head with a kraut cutter, or other hand slicing machine.

Beet tops.—Tops of young beets in suitable condition for greens should be selected and washed carefully. Both the leaf stalk and blade should be cut into sections about one-fourth-inch long and spread on screens and dried.

Swiss chard and celery should be prepared in the same way as beet tops.

Rhubarb.—Choose young and succulent growth. Prepare as for stewing by skinning the stalks and cutting into pieces about one-fourth inch to one-half inch in length and dry on trays.

Dried products should be packed temporarily for three or four days and poured each day from one box to another to bring about thorough mixing, and so that the whole mass will have a uniform degree of moisture. This is called "conditioning." If, during this conditioning, any pieces of the products are found to be too moist, they should be returned to the trays and dried further. When in condition, the products may be packed permanently in tight paper bags, insect-proof paper boxes or cartons or glass or tin containers.

Canning Tomatoes in Glass.

To the Editor:—I believe I can give a few ideas on canning that may benefit some. There are a great many women who are unable to can tomatoes in glass so they will keep. I tried and tried, but failed, so I solved the problem last year by experimenting both with tomatoes and blackberries.

I sterilized my glass jars, filled them with tomatoes, added a teaspoonful of salt to each quart, put on the rubber and lid (not very tight), then set the jars in a gallon sirup bucket of cold water. I just laid the lid on top so the steam could escape and by the time the water boiled the tomatoes were cooked. Then I screwed the lid on tight. I could hardly wait till I needed them to see if it was a success, and, sure enough, it was, for they were fine.

Blackberries have always been hard for me to keep, so I tried them the same way, sweetening them a little, and they were as fine as the tomatoes.

Tin cans are so scarce now I felt that this might be worth knowing to some at least. I expect to use the boiler when I can this year, and I am going to put up cherries and raspberries the same way.

Mrs. Florence Beal.

Rose Beads.

To the Editor:—I have been reading with interest and appreciation the letters the readers have written to the Home department. I have found so many things which are helpful and useful to others that I hope someone will help me. Can anyone tell me how to make beads from rose petals? I should be very grateful for this information. I should like, also, to know of an attractive way to string them.

Loraine.

Many persons are unaware that the green and tender tops of many vegetables, such as radishes, turnips, celery and beets, contain valuable mineral and other food substances, and are excellent cooked as greens, or even as additions to salads.

Recipes.

Chicken Pudding.—Two cupfuls leftover chicken, diced, two eggs, two cupfuls milk, one can of corn or two cupfuls green corn, one teaspoonful salt, one-eighth teaspoonful pepper. Butter a baking dish or casserole and put in the chicken. Pour over it a mixture made of the two eggs beaten, the milk, corn and seasonings. Put in a pan of hot water and bake until set, in a moderate oven.

Prune Cornstarch Pudding.—One-half pound prunes, one-third cupful cornstarch mixed with one-fourth cupful cold water, one cupful sugar, two cupfuls cold water, one and one-third cupfuls boiling water, one-half cupful chopped nut meats, a few drops oil of lemon. Wash prunes. Soak overnight in cold water. Boil these in the same water till soft; slip out the stones and cut prunes in quarters. Add sugar, boiling water, and oil of lemon; simmer five minutes, then add cornstarch mixed with cold water, and boil twenty minutes longer; stir in the nut meats. Serve cold with plain or whipped cream.

Barley Muffins.—One cupful whole wheat flour, one cupful barley meal, one-fourth teaspoonful salt, two teaspoonfuls baking powder, one egg, one and one-fourth cupfuls sour milk, one-half teaspoonful soda, two tablespoonfuls beef drippings or lard. Sift flour, barley meal, salt and baking powder. Dissolve soda in a little cold water and add to sour milk. Combine flour mixture and sour milk, add beaten egg and melted fat. Bake in muffin pans in a moderate oven.

Pea Salad.—Drain a can of peas, peel and dice three medium-sized cucumbers, and prepare one-fourth pound of nut meats. Mix all together and moisten with a boiled salad dressing.

THE YOUNG FOLKS

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

Has Some Young Pigeons.

Dear Young Folks:—I am a little girl ten years old. I live on a farm of 160 acres. I have a little brother five years old and another eight, and two sisters, one a year old and one three.

Alonzo, my oldest brother, brought two young pigeons to the house the other day and I do not know what to feed them. Could any of the boys or girls tell me in their letter what to feed them? I feed them pop corn and corn, but they don't seem to eat. We have a little baby mule. It is black. I love my mother and father. I am in the fifth grade at school.

—Lucille.

Helped Father Harrow.

Dear Young Folks:—I have written to you twice before, but I guess my letters found the hungry waste basket. I am twelve years old, five feet three inches high, and have blue eyes and dark brown hair. I am a lover of farm animals. I have harrowed about sixty acres for my papa this spring. I am breaking two colts to ride now and think it is lots of fun. I like farm life much better than city life. —Dorsie.

A Summer Vacation.

Dear Young Folks:—I am sending you a story and I hope you will like it.

When school closed for the summer vacation Harry and Lolna were going to their grandfather's. School was out on Friday so they helped their mother get ready, for they were to go on Saturday. They could hardly wait to get started to the train. Their train didn't leave until four o'clock in the afternoon and the children thought it was the longest afternoon they ever saw.

They didn't get to their grandfather's until ten o'clock Sunday morning. Their grandfather was at the train to meet them. It was ten miles from town out to his house. They talked all the time they were going out and their grandfather told them all about the little chickens and ducks.

At last they came to the house. It was a large house with shade trees all around it. Their grandmother had dinner all ready for them and when they got through with dinner they asked their mother if they could go out and play and she told them they could.

About three o'clock in the afternoon their mother began to wonder where they were, so their grandfather went out to look for them. In a little while he came back and said he couldn't find them, so their mother and grandmother went out to hunt for them. They found them down by the brook picking flowers. When they got back to the house it was supper time, so they ate their supper and went to bed and dreamed they were down by the brook picking flowers again. They had had a lovely time the first day of their vacation.

—Nellie.

A real furnace. Heats whole house comfortably, dependably, cleanly and economically *from one register.* Exactly same construction as the old reliable *Mueller* line, but without pipes or flues. Ideal for old or new homes and buildings with small or partial cellars. Saves 35% in fuel. Burns hard or soft coal, coke or wood.

Made of solid cast iron, has triple jacket, substantial firepot and radiator, best type grate. Designed right, built right. 60 years of experience and the *Mueller Guarantee* behind it.

Tear out this ad, write your name and address on margin and mail to us for valuable free book on pipeless heating, and name of nearest Mueller dealer.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for June 24, 1917.

The Purpose of John's Gospel.

REVIEW—Read John 21:15-25.

GOLDEN TEXT—These are written, that you might believe that Jesus is the Christ, the Son of God; and that believing ye might have life through his name.—John 20:31.

There are a variety of methods to be followed in reviewing the work of the past six months and to give variety. Teachers of classes, or superintendents of schools may select one or combine several, as their judgment dictates. Of course, the easiest way is to procure a good speaker who is familiar with the Gospel of John and the lessons of the past quarter, and let him bring out in the review its most outstanding and salient features.

One method would be to have one-minute talks either by members of the class or persons selected from the school. Each of twelve scholars could be assigned one minute, each to have one of the lessons of the past quarter.

Another good way would be to take the outstanding and significant verses from the lessons of the quarter, not the golden text, but verses which seem to emphasize the outstanding features of the six months' work. "Behold the Lamb of God," (Ch 1:36): "Ye must be borne again," (3:7); "Come see a man which told me all things that ever I did; is not this the Christ?" (4:29); "Verily, verily I say unto you, he that heareth my word and believeth on him that sent me, hath everlasting life and shall not come into condemnation, but is passed from death unto life," (5:24). "I must work the works of him that sent me while it is day; the night cometh when no man can work."

Another method of review would be, particularly in the adult classes, to have each lesson with its present-day emphasis. For instance, the past quarter: Lesson 1—The Christian in his dealing with blindness. Lesson 2—Modern wonders of healing and medical missions. Lesson 3—The shepherding of church members. Lesson 4—Do we know how to give? Lesson 5—Is Christ supreme in our national life? Lesson 6—Ambition and its cure. Lesson 7—The world's good springing from Christ. Lesson 8—Temperance reform. Lesson 9—The Holy Spirit in everyday life. Lesson 10—How Christ is betrayed and denied today. Lesson 11—The uplifting power of the cross. Lesson 12—Why men believe in immortality.

A good method of review would be to have someone take up each of the golden texts, announcing it in advance that pupils may be prepared for this method. The teacher would write the texts of the quarter, each on a separate piece of cardboard, and lay them face down on a table; pupils would then draw the golden texts, one at a time, and tell what the lesson is to which this text belongs, giving as full an account of the lesson as possible, the teacher helping out with questions where necessary.

It will be of great value to the pupils if they can get in this review a clear outline of the main events of Christ's last weeks upon earth, covered particularly by the past quarter. There are forty standing events of the past quarters: (1) The healing of the man born blind; (2) Jesus the good Shepherd; (3) Jesus sending forth the seventy; (4) Jesus in Berea; (5) The raising of Lazarus; (6) The ten lepers healed; (7) Bartimaeus at Jericho; (8) Jesus visits Zaccheus; (9) Jesus anointed by Mary; (10) The fig tree; (11) Triumphal entry; (12) Cleaning the temple; (13) Weeping over Jerusalem; (14) The widow's mite; (15) The Greeks seek Jesus; (16) Preparation for the passover; (17) Washing the disciples feet; (18) The Lord's supper; (19) The farewell discourse; (20) The farewell prayer; (21) The agony in Gethsemane; (22) Judas betrays Jesus; (23) The arrest of Jesus; (24) Peter denies Jesus; (25) Jesus before Ananias; (26) Jesus before Caiphas; (27) Jesus before the Sanhedrin; (28) The mocking of Jesus; (29) Jesus before Pilate; (30) Jesus before Herod; (31) Pilate condemns Jesus; (32) The sorrowful wait; (33) The crucifixion; (34) The seven last words; (35) Jesus dies; (36) Burial; (37) Resurrection; (38) Appears to Mary; (39) Appearance during the forty days; (40) The ascension.

As brought out heretofore, John sets forth the purpose of this Gospel; namely, that "Jesus is the Christ, the Son of God, and that believing on him we might have everlasting life, eternal life in his name." (See golden text).

A Suggestion.

In setting forth this review, let us not as teachers and officers, overlook the opportunity we have of calling from our scholars an expression of the faith that has been born within them. (See Rom. 10:9, 10.) Jesus the light of the world has power to set me free from sin and "whom the son shall make free is free indeed." If we properly set him before our scholars, they will be made free from the slavery of sin and enter into the freedom of believers. True faith is built upon facts; those who accept and believe these facts will have everlasting life.

Home Canning Outfits

Be Patriotic! Be Economical! You can be of great help to the country by doing your share toward conserving all food stuffs. Eliminate all waste. You can be economical, reduce the high cost of living and provide for the future welfare of yourself and family by storing surplus foods. Don't delay. Write today and investigate the Butler Home Canning Cookers.

Practical Economical Simple

They are just the thing for home use. Cook quicker, better, with less trouble than old style methods. Adapted to all fruits and vegetables. Cooked products have better color, flavor and shape, being cooked whole in the jar or can.

Butler Cookers are strong, yet light in weight and easy to handle. Substantial enough to last for years. The low price for which you can get these great cookers and the wonderful work they do make them almost a necessity for every household.

Steam or Hot Water Bath Methods.

Write today for free descriptive literature giving full information about different styles. Present prices not guaranteed. Steel market uncertain. Don't delay. Write today. Do your patriotic duty and help conserve the food supply.

WANTED TO HEAR FROM OWNER OF GOOD farm for sale. State cash price and description. Address D. F. Bush, Minneapolis, Minnesota.

Worth-While Farmers Club

To the Editor:—The present officers of our club are: President, Daniel Flack; vice president, Mrs. J. Matteson, Elkhorn, Wisconsin; secretary, Mrs. H. E. Reynolds, Lake Geneva; treasurer, Geo. Brown, Lake Geneva. We had regular club meetings through the past winter with a different topic for discussion at each association and always with a speaker for each evening. Just at present the club is most interested in a membership campaign and it has proved a very good way to get members. We have also started a boys' club for the benefit of the young boys and we hope to see them become even more interested in farm work. We also have a girls' club for the training of girls in domestic science.

Mrs. H. E. Reynolds.
Secretary Worth-While Farmers' Club, Walworth Co., Wis.

Wisconsin Crop Report.

(Continued from page 8.)

good for a good yield per acre. The acreage of potatoes will be about one-third larger this year than formerly. Live stock are normal in number and doing nicely.—M. P. Salter.

Waukesha County.—Clover is making rapid growth. Alfalfa winterkilled to some extent. Corn that is up looks well. Small grain promises a big crop. Pastures are good and the first crop of hay will be heavy.—W. J. Mann.

Wood County.—Recent warm weather and rains have improved the crops greatly. Oats, rye and corn are normal. Wheat and barley are not grown here. Hay is coming up fine. Garden truck is making good progress, but the fruit crop will be light. All live stock are healthy.—Fred E. Weber.

Our Farm Help Column

HELP WANTED.

D. M. Jones, R. F. D. 1, Box 47, Creshard, S. D., wants experienced farm hand. No boozer or cigarette user need apply. Wages $45 per month. Will hire until first of December by the month and no lost time.

Live Stock and Commercial Notes.

Gathered by Representatives of The Wisconsin Farmer.

M. H. O'Keefe & Sons—Waunakee.

AS president of the Wisconsin Duroc Jersey Swine Breeders' Association, M. H. O'Keefe, of Waunakee, is well known, though nothing has ever been said about his Durocs. As is well known, Mr. O'Keefe is inclined to be a little timid about blowing his own horn, but he has some hogs that are worthy of publicity. Right here we want to say that the success of the Duroc sale held at Madison last winter was greatly due to his untiring efforts. One of the good sows in the herd is sired by G. J. Cherry Chief, out of a dam by The Professor. She has a nice litter by Illustrious Professor. Another good sow is of Top Col. John's Ohio Chief and Marion's Wonder breeding and she has a fine litter of nine. A good sow tracing to the noted Ohio Chief and Proud Ohio Chief has a good litter of five pigs. The $90 sow purchased in the Madison sale sired by Prince Defender has seven dandies by Royal King 4th. This is one of the best litters on the farm. A sow that combines the blood of the champion, Freed's Col., Chief's Col., Muncie Chief and Helen Blazes is raising 11 of the 14 pigs she farrowed. Most of these pigs are sired by Regulator Wonder. On his sire's side he traces to Top Col. and Marion's Wonder; the dam goes back to old Ohio Chief and Proud Advance. The attraction on the farm is the present herd boar, Giant Algo. He is sired by Col. Algo, he by King the Col., out of a daughter of Chief Select. Giant Algo is a half brother to Algo's Giant, the junior champion boar at the National Swine Show. This firm are now offering boars and gilts and they are good, having been carried along in nice shape. Buyers will be pleased. Write for details.—Adv.

B. W. Little's Short-horns.

JUST at this time B. W. Little, Janesville, Wis., has for sale six young bulls sired by his good breeding bull, 17th Duke of Wapsie. One of the good young bulls is out of a daughter of Siddington Duke 6th, and she is only removed four times from the noted Imp. Grand Duchess of Oxford 60th. This bull is roan in color and is a good one. There is a light roan bull in the bunch, that is a full brother in blood to the one mentioned above. A half sister to the dam of this bull is giving over 50 pounds milk a day at this writing. Mr. Little can supply your wants if you want a straight Bates-bred bull. Write him for a tabulated pedigree of the bulls he has for sale and please mention The Wisconsin Farmer.—Adv.

Harvey Little Short-horns.

HARVEY LITTLE'S milking Short-horns, of Evansville, Wis., are too well known in Wisconsin to need much comment. We simply want to mention the fact that he has a couple of good bulls for sale that are of serviceable age. One of them is a rich red, just past a year and he is sired by a Scotch bull and his dam gave 6,488 pounds of milk and his grandam gave 9,843. He has an outstanding roan bull that looks like a real herd-bull prospect. His grandam was in the 10,000-pound class. Besides these he has several young bulls that are doing fine out of his best cows. If you want beef and milk you can get it in this herd. Mention The Wisconsin Farmer when writing. See page 16.—Adv.

Webbs at Poynette.

WITH this issue of The Wisconsin Farmer, W. A. Webb & Sons, Poynette, Wis., start an advertisement offering Duroc Jersey spring pigs. We called attention to this herd a short time ago and we will not go into details at this time other than to say that they own and are raising a class of Durocs that will give satisfaction. Their blood lines are the most popular, and, as they are good feeders you will not find the pigs neglected. They will gladly sell you a pair not related and they guarantee satisfaction in every respect. Write them for further description.—Adv.

Meinking Polands.

R. MEINKING, Bangor, Wis., changes his advertising copy and now offers you the pick of 104 March and April Poland China pigs. We saw these pigs some time ago and Mr. Meinking had them coming fine. They are sired by Double Hadley 4th and out of fine, smooth sows. There is a fine litter on the farm out of a Big Joe-A Wonder dam that are for sale. There is another litter sired by Young's Big Joe out of a daughter of Orange Wonder from a Master's Giant dam. Get in on these if you want something really classy. See page 15.—Adv.

Blood of Grand Champion.

WITH this issue of The Wisconsin Farmer, McClurg Bros., Viroqua, Wis., start their usual card offering for sale. Durocs of the most fashionable breeding. We will have more to say about this herd later, however, we might mention that every one of the Duroc Jersey boars that they have for sale are sired by a son or out of a daughter of a grand champion. If you buy now you get the pick of their boars. Pedigrees and crates furnished free. Write for details at once.—Adv.

Bred Durocs For Sale.

DON'T forget that Frank H. Arnold, Janesville, Wis., has a number of Duroc gilts for sale. They are fall yearlings and are bred to farrow in August and September. Bred Durocs that can be bought are scarce and here is your opportunity to get some good gilts. They are well grown and are the pick of some 40 head. Write now and mention The Wisconsin Farmer.—Adv.

Damerow Offering.

C. J. DAMEROW, Beloit, Wis., has some fall boars and fall gilts that you will be pleased with if you are in the market for anything of this breed. They come from good stock, are well bred and have been properly cared for. If interested write him at once and mention this publication.—Adv.

SALE DATES.

Short-horn Cattle.

Oct. 31, Carpenter & Carpenter, Baraboo, Wis. (Sale at Chicago, Ill.)
Dec. 1, Anoka Farms, Waukesha, Wis.

NEWS OF THE SALE RING

Pinehurst Holstein Sale.

The Pinehurst dispersion sale held on June 12th marked the end of the Pinehurst Dairy, of Sheboygan Falls, Wis. The top price of the day was paid for Pinehurst Piebe by E. V. Maltby, of Mokena, Ill., who purchased this cow for $2,000. Pinehurst Piebe has a record of 34.43 pounds of butter in seven days. Heavy buyers were the Lake Kampeska Dairy Farm, of Watertown, S. D. Fourteen animals were purchased by the South Dakota men. E. V. Maltby was also a heavy purchaser, successfully bidding for eight head. Probably one of the cheapest "buys" of the day was that of King Korndyke Akkrummer Ormsby, that went at the low figure of $910. This bull is out of a 31-pound dam and has 25 per cent of the same breeding as Duchess Skylark Ormsby, the world record cow. F. Lehman, of Watertown, Wis., was the lucky purchaser. The great number of young bulls in the ring hurt the average of the sale to some extent, but everything considered the prices were fair. King Segis Concordia Hengerveld, grandson of King Segis, also went at a very low figure considering his excellent breeding. He went to Crites Bros., Honey Creek, Wis., for $635. The average for the sale, including the young stuff, was $266. Following are the sales over $100:

King Segis Concordia Hengerveld, Dec. 16, 1911; Crites Bros, Honey Creek, Wis. $635
Valley Rose Mechthilde, Mar. 28, 1904; H. J. Perrigo, Beloit, Wis. 230
Parthenea Piebe De Kol, Sept. 13, 1903; G. E. Turville, Oconomowoc 130
Pinehurst Lady, May 15, 1909; Edward Yohn, Watertown, Wis. 160
Pinehurst Jane, Jan. 26, 1912; Lake Kampeska Dairy Farm, Watertown, S. D. 400
Yeseltine Champion, Dec. 22, 1910; F. A. Chandler, Greenwood, Wis. .. 255
Rigtje Piebe De Kol 2d, Feb. 10, 1912; Gramling Bros., Dousman, Wis. 290
Vannatta Bug Horn De Kol 3d, Feb. 19, 1914; W. S. Laird, Shiocton, Wis. 310
Pinehurst Rose, Dec. 23, 1911; Geo. Minchell, Darien, Wis. 345
Valley Rose Mechthilde 2d, Jan. 3, 1913; H. J. Perrigo 230
Josephine Piebe 2d, Nov. 22, 1913; E. V. Maltby, Mokena, Ill. 385
Yeseltine Champion 2d, Jan. 24, 1913; Columbia County Asylum, Wyocena, Wis. 215
Jennie Glenice Champion, Nov. 14, 1913; A. Reik, Lake Beulah, Wis. 270
Princess Yeslet 3d, Feb. 4, 1914; H. Ellsworth, Elkhorn, Wis. 205
Pinehurst Parthena Champion 2d, Nov. 24, 1914; E. E. Truttschell, Sheboygan, Wis. 280
Pinehurst Vannatta, Sept. 22, 1909; H. J. Perrigo 370
Princess Champion 2d, Jan. 26, 1913; F. A. Chandler 250
Pinehurst Gertrude, Oct. 30, 1912; H. J. Perrigo 265
Valley Rose Mechthilde 3d, Dec. 23, 1913; Lake Kampeska Dairy Farm 370
Pinehurst Thoro, Jan. 10, 1910; H. J. Perrigo 330
Pinehurst Lady 2d, Mar. 3, 1914; Lake Kampeska Dairy Farm 310
Pinehurst Fayette, Dec. 19, 1911; A. C. Oosterhuis, Sheboygan Falls, Wis. 290
Pinehurst Fayette 2d, Mar. 2 1914; Lake Kampeska Dairy Farm 400
Valley Rose Segis, Mar. 3, 1916; Lake Kampeska Dairy Farm 255
Pinehurst Piebe Rigtje 2d, Dec. 12, 1913; H. J. Perrigo 280
Pinehurst Ormsby Piebe Rigtje, Feb. 6, 1917; C. J. Draves, Ft. Atkinson, Wis. 100
Segis Rose Champion, Feb. 2, 1916; Fred Weifenbaugh, North Lake, Wis. 270
Pinehurst Ormsby Rose, Jan. 21, 1917; F. E. McClure, Aurora, Mo. 200

Josephine Segis Concordia, Jan. 23,

Pure-bred Guernsey cow, Cereal of Sarnia (40340), age five years, and her two pairs of twin calves, all less than a year old. First twins dropped June 6, 1916, both females, sire, Clarence of Sarnia (22850), second twins dropped May 11, 1917, male and female, sire, Preel of Homestead (34414). Besides the four calves she did remarkably well in the production of milk and butter fat at Old Hickory Guernsey Farm, F. W. Abbs, proprietor.

FARMERS' MARKET

WANTED — FOR SALE — TO EXCHANGE

THIS department is to bring the buyer and the seller together. You may have live stock, poultry and eggs or machinery for sale. You may want to sell or buy a farm. Write your copy for the advertisement. The rate is six cents per word, each insertion.

THE WISCONSIN FARMER • MADISON, WIS.

FARM LANDS.

NORTH DAKOTA, most successful agricultural state in the Union, producing as many dollars per acre as states where land sells four times as high. In past five years held first place every time in production of wheat and flax; and once in barley. In climate, soil, crops, railroads, schools, roads, North Dakota exactly as good as best in Illinois, Iowa or Minnesota. You can obtain a home there without commission to us, while land is still cheap. Easy terms. Write at once for plan direct dealing. J. S. MURPHY, Immigration Agent, Soo Line Railway, 1272 Soo Bldg., Minneapolis, Minn.

LOW-PRICED CUT-OVER LAND from our company, the owners, direct to you and on terms to suit, in this ideal dairy country. You should see Rusk county before you locate, because nowhere else will the same money locate you so favorably, with every advantage, schools, churches, railways, good markets near, and crops sure. Our company wants you to locate on its lands and will treat you right. Address Flambeau River Lumber Co., Station D, Ladysmith, Wisconsin.

SILENT PARTNER WANTED—We have a fine chance to buy fine farms close to the city of Oconto, Wis., suitable for stock farms, that would feed over a thousand head of cattle, at a very low price on account of old age and death of owners. There are over 100 head of thoroughbreds on them now that would go with the farm. There is big money for the party that would furnish the money to swing the deal. Address C. S. Hart, Oconto, Wisconsin.

RUSK AND SAWYER COUNTIES—We own 20,000 acres of good land and four townsites on the Soo and Omaha lines. Forties, eighties, etc., $15 to $25 per acre on very easy terms. All high land, plenty of hardwood timber and best clay loam soil. Excellent openings for saw mills and wood-working factories. Write for literature. Upper Wisconsin Land Co., Ladysmith, Wis.

FARM AUCTION SALE—The 440-acre dairy farm belonging to the estate of Moses Kaufmann, will be sold at auction July 18, 1917; 4 miles from the metropolis of South Dakota and a fine market. Easy payments, 15 years' time; 5½% interest. For further particulars write to Jones & Matthews, attorneys for estate, Sioux Falls, S. D.

NO PAYMENTS FOR FIVE YEARS—Only taxes and interest; $1.00 per acre down, balance on or before ten years; hardwood timber land with timber enough to pay for the land, close to market, schools and cheese factories; clay loam soil, all tillable. Taylor county, the clover and dairy belt of Wisconsin. Rib River Land Co., Medford, Wis.

MARATHON COUNTY, WISCONSIN, improved farms $25.00 per acre and up; unimproved farms $15.00 per acre and up. Free list and map. Wm. Albrecht, Jr., Wausau, Wis.

BUSINESS CHANCES.

FREE for six months—My special offer to introduce my magazine, "Investing for Profit." It is worth $10 a copy to anyone who has not acquired sufficient money to provide necessities and comforts for self and loved ones. It shows how to become richer, quickly and honestly. Investing for Profits is the only progressive financial journal and has the largest circulation in America. It shows how $100 grows to $2,200; write now and I'll send it six months free. H. L. Barber, 509-28 W. Jackson Boulevard, Chicago.

MONEY TO LOAN.

MONEY to loan on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage. 6% with privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

FARM LOANS on very good farms at 5% interest without commission and with privilege of partial payments. Write Geo. L. Jacques, Special Loan Agent, Northwestern Mutual Life Insurance Company, Neillsville, Wisconsin.

COWS FOR SALE

I HAVE FOR SALE a large assortment of choice tubercular tested cows, all due to freshen soon. You can buy one or a carload. John Blanchard, Columbus, Wis.

HELP WANTED.

WANTED—Young man, good habits, clean milker, to help on small Jersey dairy ranch adjoining town. State wages. Mrs. H. G. King, Salmon, Idaho.

RAILWAY MAIL CLERKS.

RAILWAY MAIL CLERKS WANTED—$75 month. Special examinations. Franklin Institute, Dept. D176, Rochester, N. Y.

SAVE MONEY ON LUMBER.

SAVE money on your lumber bill. Write us. Pacific Coast Sawmill Co., Portland, Oregon

Pinehurst Cloe, Oct. 6, 1910; H. H. Hugett 260

The Jersey Promotion Sale.

Jersey breeders held their promotion sale at Madison, June 14th. Fifty-six head of Wisconsin Jerseys passed under the hammer of Colonel Perry during the afternoon. The top price of the sale was paid by Theodore Worley, of Fennimore, for Mabel L. Fly, an excellent heifer, both in breeding and in individuality. Nine animals sold for $200 and over. Everything considered, prices were low throughout, the average for the 56 head ranging around $130. What animals had the better breeding and records in the pedigrees sold for fair prices. Too much of the stock went at a very low figure, considering the breeding and care behind it. Following are the prices:

Eminent's Lady Love, Mar. 11, 1911; F. J. H. Stoltz, Secherville, Wis. .$190
Eminent's Tulip of Oak Grove, Feb. 12, 1915; C. J. Alt, Lancaster, Wis. 225

VOL. XLVI. NO. 26. THURSDAY, JUNE 28, 1917. WHOLE NO. 1848

Food Conservation in the Home.

IN KEEPING with our present policy to conserve every bit of the nation's food supply, the work of canning fruits and vegetables in the home seems particularly important. Enormous quantities of these products have been wasted every year, because they are perishable and cannot be shipped far or stored until there is a demand for them, but this year it is absolutely necessary to save them for food. Canning clubs are being organized for this purpose throughout all the country. Their membership includes boys, girls and grown folks alike, and their work is growing steadily in value and interest. Everyone who joins a canning club is required to learn how to can by the "cold pack" method at least one jar of every suitable product grown in his locality, and those who can provide more than enough to supply their own home are encouraged to sell the surplus on the market.

While it may not be possible for a member of every household to join a canning club, those who cannot may do their share in saving the nation's food supply by canning at home such fruits and vegetables as are available in their vicinity. Perhaps the first step in this direction is to learn the "cold pack" method. It is superior to other methods, in that it is adapted to all fruits and vegetables, requires comparatively little time, labor and equipment and produces a product with better flavor, brighter color and finer texture.

In canning operations the first essential is to prevent decay or spoiling. Very minute organisms are the cause of decay and they must be killed by sterilizing or boiling before the canned product can be preserved for any length of time. By the "cold pack" method this is done in a water bath that is easily made of a wash boiler, lard can, tin pail or any other container with a close-fitting lid. A low rack or platform in the bottom of the container is necessary to support the jars which are to be sterilized. This rack should be about three-quarters of an inch high and made of either wood or wire netting, so that it will be firm and unyielding. For convenience, wire handles may be attached at the ends to permit lifting the rack full of jars up out of the boiling water after sterilization has been completed. Although there are special outfits on the market, such as the steam pressure cooker, the wash boiler outfit has proved entirely successful and it may be set up with materials that are on hand in practically every home.

THE WASH BOILER MAKES A GOOD WATER BATH OUTFIT.

A FARM KITCHEN WHERE CANNING IS DONE WITH EXCELLENT RESULTS.

In the "cold pack" method either glass jars or tin cans may be used. Any of the well-known types of glass jars are satisfactory; the main thing is to be sure that they are sound and free from nicks or rough places around the top. As a rule, new covers and rubbers should be used every year, but sometimes the covers are used twice. Whether new or not, they should always be tested before use by filling a jar with water, fastening on the rubber and top and inverting. If the water leaks out the least bit the outfit cannot be used, since the leak will let air in and introduce organisms of decay. When tin cans are used a soldering outfit is necessary and directions for handling it are usually furnished when the outfit is purchased. In every case precaution must be taken to make the jars or cans absolutely air tight. The only additional equipment needed is a table, paring and corning knives, clean cloths, a watch or clock to time the sterilizing and plenty of fresh water. A thermometer is convenient to tell when the water is hot enough, but is not absolutely necessary. While the water may be heated on a range or cook stove, an oil stove heats more quickly and is more convenient, especially when it may be taken out in the yard.

Since there is a difference in the way in which different kinds of fruits and vegetables are prepared for canning, it is necessary to divide them into classes and explain the process for each class. For example, there is a class which consists of soft fruits, such as strawberries, blackberries, dewberries, sweet cherries, peaches, apricots, etc. These should be canned as soon after picking as possible, because deterioration and souring set in almost immediately. The canning process is as follows: Rinse the fruit by pouring cold water over it through a strainer; then cull, stem and seed, if necessary, and pack closely in glass jars or tin cans. Add boiling hot sirup, consisting of one part sugar to one and one-half parts water. Then put on the rubber and cover and partly tighten, or, if tin cans are used, put on the caps and solder the tips. Fill the rack in the wash boiler with jars and put in enough water to come within one and one-half inches of the top of the jars. Place the lid on the wash boiler and after the water begins to boil hard, sterilize for sixteen minutes. Then remove jars, tighten covers and stand jars upside down to test for leaks. If there are no leaks, wrap in paper when cool and store in a cool, dark place.

For sour berry fruits, such as currants, gooseberries, cranberries and sour cherries, the procedure is slightly different, since the fruit must be blanched and dipped before sterilizing. First, the berries are stemmed, hulled and cleaned, then placed upon a cloth and dipped cloth and all in boiling water and blanched for one minute. Then they are removed and dipped immediately into cold water, after which they are packed closely in jars. A thicker sirup is used for these berries than for soft fruits, and it should contain one cup of sugar for every cup of water. When the hot sirup has been added, the rubbers and covers are partly fastened on and the jars of fruit sterilized for sixteen minutes. The rest of the procedure is the same as for soft fruits.

Hard fruits, such as apples, pears and quinces, should be blanched for one and one-half minutes instead of one minute, as in the case of sour fruits, before plunging into cold water. When this is done and the skins and cores have been removed, the next step is to pack closely in jars, leaving the fruit whole or cutting it in quarters or slices. A hot sirup is then added, consisting of one part sugar to one or one and one-half parts of water. From this point on the process is exactly the same as that used for soft fruits,

(Concluded on page 15.)

A FRUIT CELLAR WITH THE JARS OF FRUIT PLACED ON SHELVES ALONG THE WALL.

CURRENT EVENTS

THE British and French advance in northern France and Belgium continues, although not such rapid progress is being made as was made the last week or two. Both armies have abandoned their trenches, in places, and are now fighting from shell craters, which are not easy targets for the artillery and which give the men good protection between their charges and sorties. While this is going on, General Pershing, in command of the forces which the United States will send, is getting acquainted with the situation and with the men with whom he is to coöperate when his command arrives. He was given a magnificent welcome in Paris and has spent the past two weeks studying the needs of the allied armies and discussing plans with Joffre and other military men of France. It is expected that the first detachment of the United States forces will reach France about the first of September, coincident with the assembling of the conscript army in the sixteen cantonments here in the United States. Already the stars and stripes have reached the battle lines, however, being carried there by American aviators and by American troops in the Foreign Legion. By next spring the United States proposes to be a big factor in the war, but it can do little in the way of actual fighting before that time.

HAVING abandoned their window-smashing and general obstreperous tactics with the outbreak of the war, the women of England are now in a fair way to win the ballot through having proved themselves worthy of it, by taking a hand and doing their bit while the men are off at war. The principle of woman suffrage was adopted in the house of commons last week by the overwhelming majority of 330 votes. It is expected that proposal now will be made that the franchise be conferred on women on the same basis as men. The opponents of the measure among other arguments made the best they could of the reports received here of the attitude of Miss Jeanette Rankin, the only woman representative in the American congress, on the question of the entry of the United States into the war. Sir Frederick G. Banbury, unionist, for instance, described Miss Rankin as having been hysterical and unable to vote, but this and other pleas against the ability of women to exercise the franchise fell on deaf ears, and when the division was called the members trooped into the house with the aim of putting an end once for all to a question which they had made up their minds no longer was an academic one, by voting upon it as a live issue. The English women have waged a long and bitter fight, but victory for them seems now imminent.

RUSSIA, Italy and Belgium have war commissions in the United States at the present time, following the visits of similar commissions from England and France. The Italian commission made a tour of the grain belt last week. Marconi, the inventor of the wireless telegraph, is a prominent member of this commission. The Belgian commission is headed by Baron Moncheur, who presented to President Wilson a personal letter from King Albert, of Belgium. In a speech of presentation the baron thanked the United States for the support it had given his country by feeding and clothing the people and then added: "But the chivalrous sentiments which animate the people of the United States went further than this when President Wilson, giving an admirable example of disinterested power, uttered the words well fitted to make us tremble with hope and to cause us to fix our eyes confidently upon the starry banner which has become more than ever the symbol of strength placed at the service of the highest and most pure principles. Leaning upon the young, strong and generous hand which the American people holds out to her, Belgium, once she is delivered from the oppression of the enemy, will arise and throwing aside the odious weight of foreign occupation will courageously and proudly resume the path of progress in the light of the sun of liberty." In his response President Wilson declared: "The American people have been able to understand and glory in the unflinching heroism of the Belgian people and their sovereign, and there is not one among us who does not today welcome the opportunity of expressing to you our heartfelt sympathy and friendship, and our solemn determination that on the inevitable day of victory Belgium shall be restored to the place she has so richly won among the self-respecting and respected nations of the earth." The United States has a tender feeling toward the Belgian people and their sovereign and will never rest until justice has been done them, and their country has been restored.

ELIHU ROOT, United States senator from New York and former secretary of state, heads the war commission which this country has sent to Russia to find out what that country's needs are and to coöperate with it in carrying on the war. John F. Stevens, one-time engineer in charge of the building of the Panama canal, heads a commission of railroad men who are assisting in giving Russia the transportation facilities of which it stands sorely in need. In promising the help of this country Senator Root made this declaration: "No enemy is at the gates of America, but America has come to realize that the triumph of German arms means the death of liberty in the world; that we who love liberty and would keep it must fight for it, and fight for it now when the free democracies of the world may be strong in union and not delay until they may be beaten down separately in succession. So, America sends another message to Russia—that we are going to fight and have already begun to fight for your freedom equally with our own, and we ask you to fight for our freedom equally with yours. We would make your cause ours and our cause yours, and with a common purpose and mutual helpfulness of a firm alliance, make sure of victory over our common foe." In responding to Senator Root, on behalf of Russia, the minister of foreign affairs promised that his country would continue fighting to its utmost, saying: "The Russian people consider war inevitable and will continue it. The Russians have no imperialistic wishes. We know that you have none. We shall fight together to secure liberty, freedom and happiness for all the world. I am happy to say that I do not see any moral idea or factor between America and Russia to divide us. We two peoples—Russia fighting tyranny, and America standing as the oldest democracy—hand in hand will show the way of happiness to nations great and small." Russian affairs seem to be clearing somewhat, the army having gained several minor victories within the last few days, giving rise to the hope that Russia may still prove an ally worth having and helping.

HERBERT C. HOOVER, the food administrator of this country, has called upon the housewives of America to help him conserve the food supply. He proposes to enlist all of them as members of the food administration, actual enrollment of the housewives of the nation to take place between July 1st and 15th. In a statement issued to the women of the United States, Mr. Hoover made these telling points: "Since food will decide the war, each American woman can do a real national service by protecting the food supply of the nation. Ninety per cent of American food consumption passes through the hands of our women. In no other field do small things, when multiplied by our hundred million people, count for so much. A single pound of bread saved weekly for each person will increase our export surplus of wheat 100,000,000 bushels, and an average saving of 2 cents on each meal every day for each person, will save to the nation for war purposes $2,000,000,000 per annum. The proper assurance of the food to our allies will not only encourage them, but it will maintain them in war. Without a larger margin from our abundant food supply, only to be secured by individual effort and volunteer sacrifice, the war will be prolonged, and thousands of lives, not only of men, but also women and children needlessly lost. The guiding hand of women in the home can alone control in this matter." Mr. Hoover directed the work of Belgian relief and is a splendid administrator. He is a product of the grain belt, having been born in Iowa, although much of his lifetime has been spent abroad. President Wilson proposes to give him almost unlimited power in the hope of conserving the nation's food supply.

IN a rousing public speech, delivered last week, Colonel Theodore Roosevelt denounced the sentiment abroad in the United States against "fighting England's war." The colonel demanded that Americans curtail their pleasures for the period of the war and instead give the money they might use in such frivolities to the Red Cross or other relief work. Continuing, he said: "Ours is an ignoble safety. We will get victory this time because of our far-sighted allies. Some future time, if we are not ready, we will go down in unpitied disaster. There actually have been Americans who recently have been saying:—'Why should we fight on the same side as England, our ancient foe?' I would like to see any man here unpatriotic enough to say that at this time. Abraham Lincoln's rule holds good for nations. Where a nation is wrong, fearlessly oppose it; when it is in the right, stand by it. Any man who hates England more than he loves the United States should be thrown from the country. A nation must be judged by its conduct in any given crisis. An unfriendly attitude against England is as base and unjust as would be an individual grudge between two men because their great-grandfathers fought. The sentiment is that of a traitor."

PRESIDENT WILSON issued a proclamation designating the week of June 23d to June 30th as recruiting week for the regular army and called upon unmarried men without dependents to enroll for war service in order that the ranks of the regulars might be filled promptly. The proclamation follows: "I hereby designate the period of June 23d to June 30th, next, as recruiting week for the regular army and call upon unmarried men between the ages of eighteen and forty years who have no dependents and who are not engaged in pursuits vitally necessary to the prosecution of the war, to present themselves for enlistment during the week herein designated, to the number of 70,000. Woodrow Wilson." The president's action was taken at the request of army officials who have been seriously concerned at the slow rate of recruiting for the regular army. It had been hoped that the regular service could be brought to its whole war strength of approximately 300,000 men by June 30th, which would have permitted the war department to carry out its plan in regard to the training of all the forces to be raised and also as to the dispatch of armies to France. For several days, however, the average enrollment for the army per day has been little more than 1,000 men instead of the 5,000 or more the department hoped to secure.

Poultry Clubs in Green Lake County.

The boys' and girls' poultry clubs, of which there are five in the county, were organized by County Supt. Geo. W. Kelley in February, 1917. There are about 400 boys and girls who are members of these clubs. This takes in the whole county and nearly every school district is represented. Green Lake county is the first county in the state to work this club plan out as a county-wide project.

The organization was brought about as follows: The county was divided into five centers—Princeton, Green Lake, Markesan, Berlin and Kingston, which included the territory ten miles each way around each center. In Markesan, Green Lake and Princeton the high school which comes under the county superintendent's jurisdiction was used as a meeting place, in Kingston the state graded school was used, and in Berlin the county training school was used as a meeting place.

The teachers were notified that a meeting was to be held in their center and were urged to bring in their pupils on a certain date. They came with their pupils. Pupils had to be between ten and eighteen years of age in order to become club members. The club in each center was organized, a constitution adopted, and a president, vice president and secretary were elected. At two of the organization meetings Professor Hayes, of the University, gave excellent talks on better poultry, and at two others Mr. T. L. Bewick, state club leader, was present and gave excellent talks.

The officers were chosen from the body of pupils in each club. A local leader who was a man of maturity was chosen for each center to help and advise the officers as to how best to carry out the work of the club. Mr. L. W. Peterson, principal of the Markesan High School, was chosen local leader for the Markesan center. The following officers were elected:

President—Erwin Eckert, Markesan.
Secretary—Grace Pike, District No. 2, Mackford.

Mr. Edw. Manning, teacher of agriculture in the Green Lake High School, was chosen local leader for the Green Lake center. The following officers were elected:

President—Clifford Jackquith, Green Lake.
Vice President—Elmer Schilf, District No. 2, Brooklyn.
Secretary—Chas. Wiesner, Green Lake.

Mr. Edw. Mittermeyer, teacher of agriculture in the Princeton High School, was chosen local leader for the Princeton center. The following officers were elected:

President—Arthur Luedtke, Princeton.
Vice President—Harold Hardell, District No. 8, St. Marie.
Secretary—John Nickodem, Princeton.
Assistant Secretary—Edw. Polus, Princeton.

Mr. C. D. Lambertson, principal of the Green Lake County Training School, was chosen local leader for the Berlin center. The following officers were elected:

President—Avis Gibbard, District No. 6, Berlin.
Vice President—Henry Schrader, District No. 6, Berlin.
Secretary—Carl Zamzow, District No. 1, Berlin.

Mr. Chas. Fulton, principal of the Kingston State Graded School, was chosen local leader for the Kingston center. The following officers were elected:

President—Harold Knight, of Kingston.
Vice President—Merle Williams, Kingston.
Secretary—Lillian Holvenstot, District No. 2, Marquette.

The work of these clubs is carefully planned and directed by County Supt. Geo. V. Kelley and Supervising Teacher A. L. Wishlinski. Each club center has a meeting once a month at the regular meeting place of the club. At these meetings topics pertaining to the care and feeding of the setting hen, hatching, brooding, and feeding of young chicks by the natural method are discussed. Members of the club appear on the programs; also the local leader, and at times an outside speaker. A number of meetings have been held and a great interest was shown by the club members. The supervising teacher, A. L. Wishlinski, the county superintendent, Geo. V. Kelley, the agriculture teachers in high schools, and practical poultrymen have been on programs.

Angus Men Organize in Grant County.

The enthusiasm among the Aberdeen Angus breeders of Grant county crystallized June 20th in the organization of a county association which promises to do some very excellent work in furthering the interests of this beef breed in southwestern Wisconsin. The meeting was held at Lancaster and twenty men were present. Grant county may reasonably lay claim to the title, "Aberdeen Angus headquarters of Wisconsin," for within its borders there are twenty-five men breeding pure-bred Angus cattle and representing in round numbers about 800 head. This is regarded as an opportune time to boost for the Angus breed in this state.

Many of the smaller dairymen are using Angus bulls on their dairy bred cows and in this way they are getting some good calves from which to make "baby beef." The Grant County, Wisconsin, Aberdeen Angus Breeders' Association expects to do more than simply meet once a year, elect officers, talk about politics or the war and then go home and say, "Well, that's over for another year," they are going to boost the Angus cattle in Wisconsin and let people outside of this state know that there are cattle in Wisconsin other than dairy cattle. There was some talk of sending out a view herd from Grant county next year. The idea is to pick the best cattle there is in the county from the various herds and make the fair circuits. In this way the Angus will be placed before the public in Wisconsin and incidentally the Grant county Angus. There has been some talk of a "beef week" at Madison next winter during the short course. If this comes to pass the Aberdeen Angus men of the state (and this means Grant county will be chiefly interested) will hold a sale of Angus cattle. This is a very fine suggestion and we hope nothing will interfere with this arrangement. It will do more for the advancement of this breed than all other efforts of the past combined. Mr. Arthur McKevitt, of the firm of McKevitt Bros., Bloomington, Wisconsin, was elected president. Mr. R. A. Austin, Lancaster, vice president, and Walter J. Steinhoff, Platteville, secretary-treasurer. In electing Mr. Steinhoff as secretary we believe the breeders selected a very capable man. It is a recognized fact that the secretary is the real factor of any organization and if he is a wide-awake man an association will succeed. The secretary of this association is a prominent breeder and is a real booster and we know that he will put forth every effort to advance the breed. Five directors were elected, namely: Dr. Homer Sylvester, Montfort; Phil Hauk, Cassville; Orville H. Kettler, Platteville; Harry Young, Bridgeport, and Hugo Keehner, Potosi. The membership fee is to be $1 with annual dues of 50 cents.

The state association of Angus breeders will no doubt afford hearty coöperation in the work which the Grant county association is attempting to do. Breeders of Grant county are live and enthusiastic and are willing to do considerable missionary work to help their good cause along. We expect to see Grant county become famous for its "doddies."

The Wisconsin Farmer

THURSDAY, JUNE 28, 1917.

FAMILY CIRCLE TALKS BY THE PUBLISHER

FARMERS ACCUSED OF TREASON.

I WANT to do what I can to correct and offset a report, abroad at present, which seriously reflects on the patriotism of the farmers of this section. The report is to this effect: That the farmers of Wisconsin, Minnesota and neighboring states, while enjoying unparalleled prosperity and reaping the advantages of high prices, due to the war, failed to respond to the plea of the government for money with which to take up the $2,000,000,000 issue of Liberty Bonds. I consider the charge most serious. I also consider it most unjust.

Let us proceed in an orderly manner. First, I will present the indictment. It is signed by Gov. Theodore Wold, of the Minneapolis Federal Reserve Bank, and is as follows:

The farmers, who are receiving the highest prices in history for wheat, hogs and cattle, and for practically everything else they produce, are not responding to the call of their government and are displaying apathy and indifference. The Liberty loan is a new idea, and perhaps we ought not to expect to educate all of the people in six great states in the thirty days' time that we have been at work, but the fact that stands out strongly at this time is that the farmers, either from apathy, lack of information, or because they do not have the same opportunity that is afforded the people of the cities and towns to come in touch with campaign work, are not responding. In this district, where millions of money has gone into the hands of the agricultural classes during the last year, and where the greatest prosperity has prevailed, this result is extremely disappointing.

I might follow the practice of the lawyers and file a demurrer, or some other technical legal paper, but I propose to meet the issue fairly and squarely. First, I will present a couple of witnesses, in the form of clippings from grain-belt newspapers, telling of the hearty and patriotic response of the farmers to the call of Uncle Sam for funds with which to carry on the war.

As my first witness I shall introduce a clipping from a Chicago newspaper establishing two things: first, the prosperity of the grain-belt farmer; second, his patriotism. The clipping speaks for itself:

Almost $9,000 for three carloads of live stock is, as it seems, a price almost inconceivable even for war times, but it is what John Wagoner, a farmer living at Hartland, Iowa, got in Chicago on Wednesday's market.

Wagoner says he is going to buy Liberty Bonds. He figures that if farmers are able to make such money because of the war, it is up to the farmers to buy bonds. Wagoner had forty-one head of cattle in the consignment and seventy-five hogs. All were of his own feeding, and fed with corn he raised. The steers brought within a dollar of the top for the day, and the hogs within 10 cents. The cattle at $12.75, brought $5,938 95, and the hogs at $15.90, amounted to $2,903.90, or a total for the three loads of $8 842.85. Wagoner bought the cattle last October at 9 cents.

When three carloads of stock bring $9,000, and the whole sum is turned over to Uncle Sam for munitions of war, in the hour of national peril, there can be no question as to either the prosperity of the farmer or of his perfect willingness—aye, his eagerness—to give freely of his earnings that the stars and stripes may continue to wave o'er the land of the free, the home of the brave

But, let me continue. Next I shall introduce a clipping from a grain-belt newspaper, telling of a representative meeting of farmers, called for the very purpose of subscribing for these Liberty Bonds:

Remember Lexington!

Two hundred farmers at a representative meeting last night in the supervisors' office adopted this as their battle cry for the coming week, and pledged themselves to strain every effort to buy—

A million dollars' worth of Liberty Loan Bonds.

Every farmer in the county will be personally canvassed and urged to buy a bond. The meeting was the first getting together of the county council of national defense. Every township was represented. Stirring speeches and determined pledges to show the stuff farmers are made of marked the session.

"We will show the Germans," said one of the committee, "that we are made of the same stuff as the Lexington farmers of the revolution who barricaded themselves behind their fence corners and thus saved the country."

Then someone suggested the slogan "Remember Lexington," and the room fairly rang with the historic battle cry.

The embattled farmers at Lexington, who fired the shot heard round the world, back in 1775, have worthy successors in these grain-belt farmers, subscribing for the bond issue which shall spread liberty throughout all the world.

I have other evidence to introduce, in the form of letters which have come to me within the past few weeks as a result of the advertisements for Liberty Bonds which I ran in The Wisconsin Farmer and my other farm papers, without any charge whatever, either to the government or to the banks which handle the loans; running them free, as a matter of patriotic duty, to assist as best I could. I do not have the permission of the men who wrote these letters to print them, but I am going to ask for this permission and as soon as I receive it I shall print their letters and show how hearty has been the response of farmers, from the northern boundary of Wisconsin and Minnesota to the southern line of Oklahoma—throughout the entire grain belt—to this call of Uncle Sam for dollars, which shall fight as effectively and patriotically as shot and shell. Suffice it to say, now, that the farmers of the grain belt have proved to me, by their letters answering these Liberty Bond advertisements in my papers, that they are not hoarding their money, but that they are patriotic in the extreme, fully as patriotic, in fact, as the men who stood at Lexington and held back the British redcoats in that early hour of national peril.

I consider it a libel to charge the farmer with selfishness and lack of patriotism. I propose to hunt for further evidence to offset this charge. Will my readers who have subscribed for Liberty Bonds write and apprise me of the fact? We are accused, before the High Court of Public Opinion, with a most heinous crime, to-wit: Treason. What shall our answer and defense be?

HOW THE ARMY WILL BE DRAFTED.

I AM in receipt of scores of letters from farm boys, asking me if they made a mistake in not claiming exemption from possible army service at the time they registered, if they will be exempt because their parents are dependent upon their labors, and telling me such heart-interest stories as frequently move me to tears, always to deep sympathy. I am sending a personal answer to each of these young farmers, but it occurs to me we might discuss this matter together, publicly, with profit to us all.

In the first place, as I understand the law, exemption can be claimed, and granted, after the draft has been made, regardless of whether it was claimed at the time of registration or not. Let me quote a good authority (The Chicago Tribune) on this point, as follows:

If a young man has reason to believe that he should be exempted from military call, that will be considered after registration. Exemption from service and registration are distinct and separate things. Nothing will be done about the exemptions by the government until the registration is completed and the names have been enrolled on the selective draft lists. Then the president will issue a proclamation setting forth exemption regulations and the exemption boards will get to work.

This is my understanding of the operation of the law, confirmed by practically all the military and legal authorities with whom I have talked. There are really five separate and distinct steps in the securing of what is to be known as the "conscript army," which I will tabulate as follows:

First: The registration. This has already taken place and has resulted in the government's obtaining the names of approximately 10,000,000 men between the ages of twenty-one and thirty, inclusive.

Second: The draft. This has not taken place as yet, nor has the date for it been announced. It will probably take place some time in July, the names to be drawn from a receptacle (somewhat similar to a jury box) by lot; one-tenth of the names which were registered being drawn at first, twice as many names as are needed being drawn, so as to permit of every other man being exempted and still leave an army of 500,000.

Third: The exemption. A board of three will be appointed by the president for every county and for every 30,000 of population in every city. Claims for exemption will be made before this board, the rulings of which will be subject to revision by a higher exemption board, probably one to each judicial district, or two to each state. Exemption will be made for physical and moral shortcomings, and in case the drafted man appears to the exemption board to be more useful to his country at his regular work. Men who work on farms and in munition factories will undoubtedly be exempted first, as their work is most important.

Fourth: The assembly. This will be in cantonments for drill instruction. The United States has been divided into sixteen divisions, with one camp or cantonment in each. Thus, to illustrate: Soldiers who are drawn in Wisconsin and Michigan will be assembled and drilled at Battle Creek, Mich. Soldiers drawn from Illinois will be assembled and drilled at Rockford. Soldiers drawn from Iowa, Nebraska, Minnesota, North Dakota and South Dakota will be assembled and drilled at Des Moines, Iowa. Soldiers drawn from Missouri and Kansas will be assembled and drilled at Fort Riley, Kan., and so on, until sixteen cantonments are provided, to cover the forty-eight states. Each cantonment will provide for 35,000 to 40,000 troops.

Fifth: The actual service. This will hardly occur within a year from date, as the government must build permanent buildings (to house the soldiers) at each of the sixteen cantonments, and the conscript army cannot possibly be brought together before September 1st, even if then. Six months, at least, must be given over to drilling, so that none of the conscript army will be sent abroad before June or July of 1918, at the earliest.

I hope I have made myself clear on these points; if not, write to me and I will do my best to explain the plan, in detail, by correspondence. But there is no reason to lie awake nights, worrying because exemption was not claimed at registration, nor to believe that our army is to be hurled into French trenches within the next few weeks, or even months. Uncle Sam is not going to take advantage of any of his boys, particularly those from the farm, upon whom so much depends.

In this connection, Mr. Cyrus Nolin raises an important point in a letter to me, as follows:

I commend your effort in bringing out the importance of exempting the experienced farmer from the draft, in behalf of the national welfare, for there is reason to believe the importance of this matter will not be realized, because nearly all of the registration board, who, in most cases, will be the exemption boards, are town and city men, and some of them cannot realize the difference between an experienced farmer and any other man of like intelligence. If the farmer is to be drafted, he should certainly be represented on the exemption board, also.

The point is well taken; the farmer is entitled to representation on the boards which shall determine who shall go and who shall stay at home. I sincerely hope the authorities will give him this representation. I shall do what I can to assist in bringing this about and shall advise you, from time to time, of the progress made. If I need a final, telling argument to clinch my point, I cannot possibly do better than to quote the immortal Thomas Jefferson:

Cultivators of the earth are the most valuable citizens. They are the most vigorous, the most independent, the most virtuous; and they are tied to their country and wedded to its liberty and interests by the most lasting bonds.

What exemption board can drag a farm boy from the labors of a producer in view of such eloquent and authoritative testimony and tribute to his usefulness as the real patriot and soldier?

CO-OPERATION IN BORROWING.

I AM sure that readers of The Wisconsin Farmer will be interested in a letter which one of the officials of the federal land bank has written to me in regard to a phase of the federal farm-loan law which is not generally understood. Many of my readers are doubtless aware that every farmer who borrows from one of these federal land banks must subscribe for capital stock therein to the amount of 5 per cent of the sum he borrows, $50 for every $1,000 of his loan. The letter I have just received deals with this phase of the law, as follows:

Many farmers do not understand that this is a coöperative plan of banking. They have, therefore, made applications as an individual, which makes it necessary for us to write them and make suggestions as to the formation of a coöperative association and explain that it will not be practicable for them to inject individual action, for if we had individual connection there would be no well-developed coöperative plan, as one would antagonize the other. This is something that the press does not carry to the individual in a way that they understand it, for by this chain and with the connecting link the stock subscription, small though it be, by the farmers, brings them in direct connection with a chain of big banks that extend to them the longest time ever made to an American farmer or any other farmer and at an interest rate as low as the average commercial borrower can get.

A great many people, in most cases those who do not think or else those who are opposed to the law, attempt to analyze the result of the small stock subscription, and in further explanation will say that this is for the purpose of making perfect, at least making strong, the link of mutual associations, and the day the mutual association link becomes strong and well established the farm-loan act is a success, regardless of the business features of the 6 per cent investment.

However, there are but few private corporations

(Concluded on page 5.)

THE WISCONSIN FARMER, Madison, Wisconsin

The Romance of Wisconsin's History.

Strangers who are ignorant of Wisconsin's history are apt to think of it as something prosaic, dull and uninteresting. A New York editor a few years ago described the life of this section of the country as being "socially and physically a dull gray monotone." To such as he, romance is connected only with things ancient, such as "the splendor that was Greece and the glory that was Rome."

The truth is that nothing could be more romantic, more interesting, more inspiring than the winning of Wisconsin from unsurveyed prairie, uncruised forest and uncharted rivers and lakes to the present high state of cultivation which Mr. W. H. Wiseman, one of the associate editors of The Wisconsin Farmer, found in Polk county, when addressing the federated clubs of that prosperous section on June 16th. There was hardly one of the thousand people present, representing thirty affiliated farmers' organizations, the truth about whose life and success would not sound stranger than fiction.

Although one of the newer counties of Wisconsin, a comparatively brief period has seen it transformed from almost primeval forest to a prosperous, productive, highly cultivated farming section. Men who went there with only a hundred dollars or so a few years ago are now worth from $25,000 to $35,000! There are forty-one creameries and cheese factories in Polk county! Single land companies are selling two and three farms a day! Settlers are moving in, attracted by the fine clover land! Everything is on the boom, and cattle and grass land never looked better!

The scenery is among the most attractive in a state famed for its beauty spots, and its green hillsides, with valleys dotted by beautiful lakes, furnish sights to rest the eye and delight the soul.

To the effete eastern editor or his correspondent, who assumes to "write Wisconsin up" from the windows of his flying Pullman or between munches of his sandwich at the depot restaurant, Wisconsin's story may seem flat, stale and unprofitable. But to the man who knows what the winning of the wilderness has meant, who understands the life of the people, who has heard from their own lips the stories of their struggles and final success, Polk county and all the other counties of Wisconsin are surrounded with all the glamour of romance, with all the interest of the most thrilling fiction and with the spirit of those who have conquered Nature and compelled her to yield the tribute of prosperous homes, splendid crops and a contented people.

The Farmer and the Military Draft.

Just what will be the war department's attitude toward the exemption of farmers from military duty is not yet clear. It is expected that in the near future official orders will be issued from Washington for local exemption boards to follow in the matter of all exemptions. One thing may be stated, and that is that those who registered on June 5th did not prejudice their case any by failing to state their grounds for exemption at that time. Each individual's case will be considered on its own merits in connection with the war department's ruling by his local exemption board after he has been drafted, while those who are not selected by the draft will have no occasion to consider exemption grounds unless they are selected by a later draft.

There is no question, in our opinion, about what the war department should do in the matter of those legitimately engaged in actual farming, and this opinion is based on the nation's and the world's welfare, fully as much as on the farmer's welfare. We believe that every such man should be exempted from military duty, at least for the present, and also for the future, unless the demand for soldiers becomes greater than anyone now anticipates.

We firmly believe that every real farmer can be of far greater service to the cause of the United States and her allies working in his field than he could on the firing line. We have heard much about the duty which America owes to feed the world, of the obligation which every farmer owes to increase his yield this year and to cultivate every bit of spare ground. All this is simply a question of farm help. Heaven knows that the farmers of the United States, and especially those of the grain belt, will do all they can to obtain the largest possible yields, and work early and late, to the limit of human endurance, to accomplish this. But they cannot do more than they have done in the past—not as much, in fact, owing to the increasing shortage of farm help—without more skilled farm laborers. To consider a further reduction of the farm labor supply for military purposes is to make a mock of all the campaign propaganda which state and federal agricultural departments, agricultural colleges and journals have indulged in for increased yields.

Now and then some modern Solomon, whose knowledge of farming has been gained in a ten-story office building, or at best, by his automobile trips through a farming community on his way to his golf and country club, rises to suggest in a sage manner that the college boys under draft age be used to supply any shortage in farm help. He does not realize that farm labor of today requires as specialized and skilled work as that of the clerk in his office, and that the average college boy, who has never worked on a farm, is not worth his board, not worth the time it would take to train him in the duties of the farm, which require physical brawn, mature judgment and experience.

One of the best letters along this line which we have received is the following:

> Dear Mr. Pierce:—After reading your valuable paper and noticing the comments of yourself and some of your subscribers in regard to farm boys being exempt from the first draft, I can refrain no longer from voicing my sentiments and those of the farmers in general with whom I have conversed regarding this subject. We must admit that the government needs men and must have them to defend the flag, and the farm boys are just as patriotic as any others. But what will we do if they take them, especially on the first call? Our own and other nations are depending on our farmers for provisions, which will be none too great with the best of care and help. As for untrained college boys, I have had an experience which would be typical. I was talking with a seventeen-year-old boy, who had just returned from college and wanted work. He told me that he had never harnessed a horse nor cultivated a row of corn, but he thought $45 a month and board would be about right. Now pray tell me what help such a boy would be until he had learned the knack of doing farm work, which can't be acquired in a minute? Experienced farm help, worth three or four green college boys, are now asking $55 and $60 a month and board. What will we do if they take even that away from us for service in the trenches? I have conversed with farmers who say if they have to pay $60 they will have to quit farming. And consider the farmer boys who have worked along and gotten fully equipped with teams, live stock and machinery, besides doing their bit in buying Liberty Bonds—does it seem right to take them on a moment's notice? If they must go, give them a chance to harvest their crops and dispose of their holdings or make other arrangements, which they could perhaps do by the time of a second call for men. It seems to me that this would be no more than justice to the farmer. I am glad you take the position you do and wonder if it is not possible for you to intercede with some higher authorities concerning this matter. Hoping you will exert every effort at your command, as you always have done, for fair play for the farmer, I am, respectfully yours,
>
> AN OLD SUBSCRIBER.

To every sentiment in the above letter the publisher of this paper echoes a hearty "Amen;" and he pledges himself to this subscriber and to all the rest of his readers to use his influence in every way possible to prevent any further drain on our already far too limited farm labor supply, and to secure exemption for farmers in the first draft, at least.

Let the government make good all its talk about the patriotic duty of the farmers to increase their yields this year. Let them leave the man with the overalls at work in the field and then call upon the town pool-room loafers and slackers, who are like the lilies of the field in that "they toil not, neither do they spin, yet Solomon in all his glory was not arrayed like one of these." They need the training and discipline more than the farmer boys; they can be of practically as great service to their country in the trenches as the farmer boy could; and the nation will be but little worse off for their going. To do otherwise is to defeat the whole purpose of the selective draft, which was to leave the men at home who can be of greatest service there, and to send to the firing line those who could not or would not serve the nation's needs if they were left behind. As Governor Harding, of Iowa, so well said to the War Department at Washington last week, "To urge the farmers to increased yields, to encourage them to plant large crops and then to call them from their fields before their crops are harvested, would be like ordering an army to charge the enemy and then to take away their guns and bayonets just before they sprang forward."

The Farmer's Year

Shall the farmers of the grain belt be exempted from war service? This question is asked in hundreds of letters written to The Wisconsin Farmer these days. It is one of the big problems of the time. Is a strong, stalwart, physically perfect boy of twenty-five more useful in the cornfield than shouldering a musket in the French trenches or firing a gun on one of the mighty war ships?

These and other equally big and vital topics of the time are discussed, week by week, in The Wisconsin Farmer, not only in the page devoted to the publisher's opinions on current topics, but in the Current Events and in the general editorial pages. No other farm paper is devoting so much space to such a careful and accurate consideration of the big, national problems of the day.

No farmer can afford to be without The Wisconsin Farmer. No farmer can afford not to keep posted on the big issues which are discussed in this paper. No farmer can afford not to know and to practice the utmost farming efficiency, preached by experts each week in this paper. Therefore, every farmer who is already a subscriber to The Wisconsin Farmer should renew his subscription without delay, while those who are not already on the lists should lose no time in subscribing.

This is the farmer's year. Make the most of it. Subscribe to The Wisconsin Farmer and see where your best opportunity, your highest usefulness, is to be found.

Wisconsin State Fair.

Wisconsin will have a state fair, and it should be the best state fair in the history of our state. If the weather man can induce the elements to smile in the second week in September we believe that all state fair records will be broken.

Our breeders and our grain growers should plan now for their exhibits at Milwaukee. A feeble effort was made in the legislature to call off the fair for this year, but Wisconsin is too rich and prosperous to neglect its agricultural and live stock business in such a manner, and the products of the farms are going to be so good this year that it would be a shame to keep them out of the annual friendly competition, and deprive the pubilc of seeing them.

In the live stock end, particularly, it behooves every breeder to be up on his toes. Wisconsin does not receive abroad the high consideration which the character of our stock and of our breeders warrants. Next year we hope to see the national Holstein sale come west, and it may be that we will be so fortunate as to get it in Milwaukee. It is time to be picking the stuff for this sale—Wisconsin ought to be able to get into the Holstein cattle game in a way that will not only advertise our state abroad, but profit our breeders at home. Some of our good Short-horn cattle are to be offered at public sale in the near future in Chicago, and if we mistake not the beef cattle world will sit up and take notice when the Wisconsin animals are led into the sale ring. To maintain our place in the live stock world, expositions like the state fair must go on, and they must receive more liberal support. Other breeders of dairy cattle, beef cattle and swine in Wisconsin are active and they should have the privilege of competing for worthy prizes at the state fair, no matter if the country is at war.

So we are glad that the effort to give the state fair a black eye failed, as it should have failed. And we expect to see a lively interest in the fair.

The Farmer Is Somewhat to Blame.

Farmers of Wisconsin have always been interested in coöperation, and just now they are very much alive to the subject of coöperative marketing as well as coöperative buying.

A speaker at one of our state meetings recently declared that the farmer is very largely to blame for the small prices he gets for farm produce in comparison with the prices which such produce brings on the retail market. How many farmers of our state plan far enough ahead to care for their crops until prices are better than they usually are in the fall when the markets are loaded? How many farmers are fixed with a place to store all their oats, or corn, or barley, or rye, or potatoes, or even their hay?

A few days ago we heard a Wisconsin farmer raising a terrible rumpus, oratorically speaking, about the prices at which wheat was being sold at Superior. He remarked that much of the wheat was being sold at $1 or more per bushel higher than it cost those who bought it and shipped it to Superior. He also remarked that it was a mighty funny thing that wheat that came into Superior and Duluth was such a low grade and wheat that was shipped out was nearly all No. 1 hard. We are not prepared to say whether the figures which this good brother quoted are correct or not. But if farmers will deliver grain to markets in every sort of poor condition, they must not blame the markets or the buyers if they cannot get the highest price for it. The grading of a good many farm products can be done on the farm just as well as at the terminal elevator stations. And when it is so done, the farmer may reasonably expect to get his share of good prices.

We have heard a good deal said about potatoes being sold from the farm at $1 a bushel and sold in the cities at $4. It is true, and the farmer failed to get his share, but in some measure he was responsible, or at least the system of marketing to which he was a party was responsible. Few potatoes are delivered at the warehouses in Wisconsin in the same clean and selected condition in which they appear on the markets in the cities. Someone has said that the standard potato is the potato which the housewife likes best to buy for her table. When we deliver good and bad potatoes in the same load, and add a considerable amount of dirt, we must not expect to top the market. Few of our best potato growers have sold any stock at $1 a bushel. If the potato growers of the potato sections of Wisconsin will deliver their best potatoes, well graded and selected, in sufficient lots to some central point, so that the offering is attractive to heavy buyers, they will find that the price will also be more attractive. If it is not, then there is reasonable ground for object-

FAMILY CIRCLE TALKS—By The Publisher.

(Continued from page 3.)

or incorporated companies, including banks, that have legislation in their favor like the stockholders in National Farm-Loan Associations, for National Farm-Loan Associations own for their stockholders stock in this bank and other land banks along with the United States government, and the government cannot, under the terms of the act, participate in any proceeds whatsoever, which leaves the 5 per cent investment a better chance than said farmers could possibly have if they invested it with any other stock company. At any rate, they would not have any such privilege so far as the disbursements and proceeds are concerned.

The law is very plain that this capital stock subscribed for by the farmer-borrower shall be paid any dividends earned by the bank, so that it is quite likely to be a good investment. Nor is it in any manner a bonus or commission paid for the loan, inasmuch as every cent of it will be paid back when the mortgage is paid off. Thus, supposing a farmer borrows $5,000. He buys $250 worth of capital stock in the land bank, which earns whatever dividends the bank stock pays during the existence of the loan; then, when the mortgage is paid off, this $250 is returned to him. It is simply left with Uncle Sam as an evidence of good faith on the part of the farmer-borrower and to give the plan that element of coöperative organization which is absolutely necessary to make such a far-reaching plan succeed.

AN ACRE FOR THE RED CROSS.

I WANT to commend the example set by the farmers of Washington county, Minnesota, who are donating the year's crop from one acre of land on each farm to the Red Cross fund. These farmers are doing a real patriotic service. Their corn and wheat and oats will go toward saving many a gallant boy's life in the shot-riddled and blood-stained trenches of Europe, toward solacing many a mourner, toward making less hard the pathway of the blind, the maimed and the halt.

I am indebted to a friend in Washington county for this brief account of what is being done there. It is pregnant with possibilities:

Washington county farmers are donating the year's crop from one acre of land on each farm to the Red Cross fund. This idea, conceived by W. S. Moscrip, of Lake Elmo, has appealed to the farmers of the county, and more than 100 had made pledges of an acre each today, after less than one week of the drive.

Each farmer is giving an acre of wheat, an acre of oats or corn, or a corresponding value in potatoes, peas or other crop, and the Red Cross committee of the Washington County Patriotic League is making plans to market the crop.

It is expected returns will range from $20 to $75 an acre. A big Red Cross card, displayed by the roadside in each field donated to the Red Cross, will show where a patriotic farmer lives, and will serve to advertise the Red Cross movement to every passer-by. The cards read: "This crop is growing for the Red Cross."

After harvest each farmer will take the product of the Red Cross acre to the nearest market town. The Red Cross committee will assemble the grain and produce and sell it for the benefit of the Red Cross fund. They expect to get "top of the market" from patriotic buyers.

Why should not, and could not, every county and every farmer in the entire grain belt follow this splendid example? The farmers of Canada started the movement a couple of years ago, when they set apart an acre for the government's use, giving the entire crop to help send the dominion's contingent across the seas and feed and support them. Canadian farmers have proved themselves wonderfully patriotic; they have entered into the spirit of the crisis with a magnificent unselfishness. I like to think of those farmers who have moved away from the United States grain belt, to cast their fortunes with this younger country, doing their bit along with the native-born. They set us an example which we may well follow.

And is there not proof, in the work of these Minnesota farmers, of the patriotism of farmers as a whole? Is not the claim that the farmers are not doing their duty, whole-heartedly, in the national emergency, a base libel which you and I cannot disprove too emphatically and promptly? All over this great land of ours farmers have figuratively nailed the flag to the plow and are feverishly engaged in turning under the sod, sowing and planting the seed, cultivating the land and increasing production in every possible manner. The president has called upon them to serve, as soldiers, in the fields of production, without stopping to ask what their wage shall be, what their brothers will be doing while they are thus laboring under the burning sun of summer, what the result shall be if they win or if they fail. The farmer is a soldier, marching under sealed orders this year. He knows that his general is sending him forth to do battle and that he must fight to his utmost. The farmer is a patriot, in his field and feed lot this year, fully as much as the soldier in the trench and redoubt.

And of all organizations having to do with war, certainly there is none which deserves our sympathy and support so much as the Red Cross. Always first at the front, it makes easy the last moments of the dying, cares for the dead and snatches many a life from the grim reaper, whose sickle is upraised to garner it.

James M. Pierce

ing to the buyers, and the next move is for the farmers to provide some method of storing their potatoes until they can find some buyer who will not attempt to remove them so far in the matter of price from the ultimate consumer.

One of the large coöperative packing houses of this state failed largely because no system was arranged to care for the stock offered by its stockholders. These stockholders rushed their shipments in at any time which suited them. As a result, on certain days there were several cars and on other days there were none. The company could not afford to run full capacity on some days and lie idle on other days. In another similar institution the shipments to the packing house were arranged by a zone system. Certain districts shipped on certain days. The manager of the plant was notified several days in advance about what he might expect and what kind of stock would be shipped. He was able to prepare. He saw to it that shipments from other districts were held off, and sent to the packing house at another time when they could be handled. This plant operating under this system has been fairly successful. These things only illustrate that the farmer must apply business methods to his business.

But nothing excuses the speculator or the storage house robber—there are some of them who are robbers—who collect the necessities of life for the sole purpose of holding them for a rise and charging the consumer double what they are worth. The speculator is an enemy to the farmer as well as the consumer. He urges us to raise great crops and sell them to him at a reasonable figure on the ground that we must feed our boys at the front. Then he hopes to charge our government two or three times what the farmer gets, and the unsuspecting public outside of the farmer holds up its hands in holy horror and howls about the robber-farmer.

The farmer has not received in the past, nor is he now receiving, exorbitant prices for his products. With possibly a few exceptions he does not ask for exorbitant prices. When he patriotically toils to raise big crops to help feed the armies he has a right to expect that those who handle the crop after it leaves his hands shall not enrich themselves unreasonably.

The Wisconsin Farmer Ahead.

The Wisconsin Farmer has been commended from all sides for the promptness with which we presented our readers with a complete report of the National Holstein Association meeting and sale at Worcester, Massachusetts. The information concerning this session and sale was given to the readers of The Wisconsin Farmer a week earlier than they could have secured it in any other Wisconsin farm paper. Special pictures of Wisconsin men who attended the sale and animals which were purchased by them were published exclusively in The Wisconsin Farmer. Such service is made possible only by the alertness of our editorial staff. The policy of The Wisconsin Farmer is to distinguish between matters of real and minor importance and to give our readers complete reports of such events as interest most the largest number. The instance herein referred to is only one of a number which we have no doubt our readers have already noticed.

Food Saving Day in Wisconsin.

Throughout the state of Wisconsin Sunday, July 1st, is to be known as "Food Saving Day." Herbert Hoover, in charge of food conservation in the United States, has requested that the day be generally observed, not as a day to accomplish all the conservation of food, but as a day when this important subject shall be given serious consideration in all the homes of the land. Being Sunday, a request has been made that the ministers of the country talk on food waste and food conservation. Being Sunday, our farm folks will be gathered at home, at least for a part of the day, and it will be about as serious and Christian a duty as can be performed that day to decide what plans shall be adopted to conserve food for the farm home and perfect arrangements to garner just as much in the fall as can be gotten for the markets.

Food conservation will not fall entirely upon the men. The women of our state have a very important part. Let us see to it that all the products of the garden are saved this year and not allowed to rot. We will call that farm housewife unpatriotic who buys canned fruits and vegetables at the store and fails to put up that which is raised at her own home. Almost every farm housewife can double the food put up for winter if she tries. When she does it she simply releases that much more food for the balance of the country and for our allies across the seas. So, it is a patriotic thing to can fruit and vegetables for this winter. Mother and the girls can sing "America" very appropriately while they are canning eatables, drying corn or fruits, or putting away any sort of good food for the winter months. It may be that the food you put up on the farm will release other food which will feed some of Uncle Sam's soldiers in the trenches. When you help send food, by saving food at home, you are just as much a part of the world's army fighting for democracy as the men who carry the muskets or load the cannon on the battlefield.

Traveling through our great state, we see many flags waving from the farm homes. Supporting this flag is the farm garden, the farm orchard, the fields and the live stock—all a part of the great supply army without which field armies are useless. Let us all help our leader, Mr. Hoover, to save the food. Let us have no empty cans or fruit jars on the place this year.

HE KNOWS WHAT HE NEEDS.

Farmers who are raising potatoes this year should plan now for having them sprayed with Bordeaux mixture for the prevention of late blight. Paris green may be combined with the Bordeaux mixture and the bugs killed with the same operation. No farmer can afford to take the risk of raising diseased potatoes. It cuts down the yield at harvest time and may require one or more sortings of the potatoes in the cellar. It is much cheaper to spray. Begin to plan for it now. Write to the experiment station or ask the emergency food agent for information on Bordeaux mixture if you do not have it, and raise only first quality potatoes. Stop the waste.

Wasted Grain and Time Could Have Paid Your Thresh Bill

Save your grain from the straw stack. Hire the man with a Red River Special, or get our "Junior" Red River Special and thresh your own grain. "We know that this separator saved enough grain to pay our thresh bills," says W. B. Sharp and 13 other farmers of Cordell, Oklahoma, after threshing with a

Red River Special

It Saves the Farmer's Thresh Bill

Here's the thresher that's different. It *beats out* the grain. Built for fast work too. Saves the farmer's and thresherman's time—crowds more bushels into the day's work and more good jobs into the season's run.

Our "Junior" Red River Special is the ideal thresher for home threshing. It's a younger brother to the Red River Special. Small enough to make home threshing pay—big enough to make money in custom work.

Has every needed feature of the big Red River Special—famous "Man Behind the Gun"—shakers, large sieves, etc. Hook it to your tractor.

La Crosse County Guernsey Day

All Breeders of County Co-operated to Make Guernsey Day at West Salem, June 8th, a Big Success.

GUERNSEY DAY, as instituted and inaugurated so successfully by the La Crosse County Guernsey Breeders' Association at West Salem, Wisconsin, June 8th, is a distinct feature in Guernsey development circles. For years La Crosse county has been one of the principal Geurnsey centers of the West. The influence of the first breeders has been to promote the interests of the breed and today more than 150 pure-bred sires are doing service in the county. The blood of the most noted bulls of the breed predominates and the splendid production records of the cows keep the breed constantly before the public eye.

Improvement has been the keynote of this county association and favored with a strong executive board this idea is being firmly implanted in the mind of every breeder. This association realizes the position of the young or inexperienced breeder, and to direct him along the right lines is one of its principal objects. Winter meetings, lectures and summer meetings have been held each year, but nothing seemed to bring the breeders to a point where each could see what the other fellow was doing. If only a show could be held where type and lines of breeding could complete and breeders could meet on a common ground and discuss their problems it was felt that the results would be far-reaching. The result was Guernsey Day.

THE PARADE GUERNSEY DAY, WEST SALEM, JUNE 8TH.

All the breeders in the county were asked to bring cattle to West Salem June 8th. To say that they coöperated in the movement is putting it mildly. More than eighty head lined up on the date named and by ten o'clock the pavilion was filled to overflowing. Breeders drew cattle for nineteen miles. Fifteen boys in the calf club brought in their calves. Every class was well filled and there were classes for aged sires, young bulls, bull calves, aged cows, cows two to three years old, yearling heifers and heifer calves. Twenty-eight cows were shown in the aged class. Nine aged bulls competed for places. Any class would have done credit to a state fair. Hills, of the Guernsey Cattle Club, and Prof. G. C. Humphrey placed the ribbons.

Executive committe La Crosse County Guernsey Breeders' Association. Reading from right to left—H. D. Lovejoy, W. D. Sandman, Otto Moos, directors; Pres. S. L. Dudley; Prof. G. C. Humphrey, judge; Hill of the Guernsey Cattle Club; T. H. Campion, secretary.

BOYS' CALF CLUB, GUERNSEY DAY

Promptly at 12:15, headed by the West Salem band, the cattle were paraded through the streets of West Salem.

Farmers for miles around were present as well as scores of people from neighboring towns and cities.

Judging contests were held for men and boys.

In the afternoon an interesting program was given. Professor Merril gave a splendid talk on the "Opportunities of the Farmer."

When the day was done everyone was happy and Guernsey Day in La Crosse became an assured yearly event.

Cow-Testing Reports.

Splendid Record in Monroe County.

To the Editor:—The month of May found many members of the Monticello Cow-Testing Association short on feed and they were obliged to put their cows on pasture before the proper time. Weather conditions have been unfavorable for maximum production, but notwithstanding these handicaps our cows did remarkably well. In May we tested 652 and 143 of these produced forty pounds or more of butter fat. Forty-seven of this number produced over fifty pounds butter fat. Baltz Hoesly had the five best cows and the best herd average. Twenty-seven cows averaged 1,548 pounds milk and 54.2 pounds fat. If there is any herd in cow-testing associations which can surpass this I would like to hear from them. The best grade cow is owned by Henry C. Klassy. She produced 1,469 pounds of milk and 61.7 pounds butter fat. The heaviest milking cow, owned by Wm. Spring, produced a total of 1,804 pounds of milk. At present we have twenty-five members with 271 registered Holsteins, 427 grade Holsteins, twelve grade Brown Swiss and three native cows. Quite a few of our farmers are handicapped by the scarcity of farm help and the cows, as a rule, have had to suffer. While some farmers have been keeping calves from their poorest cows they are now selling them as rapidly as they can. The forty-five-pound list for the month ending June 13th is as follows:

Owner, name and breed	Age	When fresh	Pounds milk	Percent of fat	Pounds B. fat

Western Wisconsin Holstein Meeting.

To the Editor:—The annual summer picnic of the Western Wisconsin Holstein-Friesian Breeders' Association, held in coöperation with the Guernsey and Jersey breeders' associations of Monroe county, on the beautiful grounds of the Wisconsin public school for dependent children, at Sparta, Wednesday, June 20th, was a splendid success. The attendance was good. The day was ideal and no more suitable place could be found for such a gathering. Dr. J. F. Brown, superintendent of the state school, did everything in his power to make the occasion a success. Besides donating the silver cups as prizes for the judging contests, he left nothing undone to make those present feel at home throughout the day.

Mr. W. H. Hanchett, a live-wire farmer of Monroe county, and a prominent Wisconsin institute worker, briefly traced the development of breeds in his introductory remarks. No breeder present could help but feel that he should be a loyal supporter of his breed association, county, state and national.

Prof. D. S. Bullock, of the Wisconsin Live Stock Breeders' Association and university animal husbandry department, using two Holstein cows of the school herd, gave a splendid dairy cow demonstration. Many questions were asked and many valuable points brought out.

T. P. Abel, a prominent attorney of Sparta, gave most inspiring patriotic address and was loudly cheered.

J. D. Imrie, the county agent, gave a most interesting talk on the part the dairy cow can play in the war. The judging contest was won by the following: Men—Fred Nuttleman, West Salem, La Crosse county. Boys—Henry Schauf, Sparta, Monroe county.

T. H. Campion.

A joint report of the Wisconsin Department of Agriculture and the federal department indicates that farmers in Wisconsin have increased the acreage of all spring-sown crops. The increase of spring wheat is given at 35,000 acres more than last year. In a number of counties the acreage is more than doubled. Thousands of acres of old pasture lands and old meadows have been plowed up and used for spring-sown crops

A Bigger Yield From the Same Field.

From any field that you have been manuring by the hand method you can get a bigger yield if you use the spreader method—and save much time and labor.

A good spreader tears up the manure into small particles and spreads it evenly. The manure goes farther. It can be worked well into the seed bed so that the plant roots get all of its valuable plant food. *Wasting manure is like wasting money—a good spreader makes every particle of manure count.* A Newton County, Ind., farmer testing the spreader and hand methods of applying manure on two ten-acre tracts found that the *spreader method gave 120 more bushels of corn, 140 more bushels of oats and 9 more tons of clover.*

The John Deere Spreader

The Spreader with the Beater On the Axle

has special capabilities for increasing your crop yields. Its exclusive features make it the ideal implement for the best method. Ask any owner of the John Deere Spreader about the way it increases crop yields and saves time and labor. After you have operated a John Deere Spreader of your own for a year, you will fully appreciate how much these gains really mean. *You'll find that the Spreader with the Beater on the Axle more than pays for itself in one year from the gains it gets on even a fair-sized farm.*

The beater on the axle construction *eliminates all chains, clutches and scores of other trouble-making parts. Does away with half the types of castings otherwise necessary. Does away with adjustments. Puts upkeep at minimum. Makes the John Deere Spreader exceptionally long-lived.*

Beater is all steel—practically indestructible—runs on roller bearings, aiding light draft. Beater teeth spirally arranged—tear up manure perfectly and distribute it evenly. Deliver manure close to the ground—wind does not affect spreading.

Revolving rake feeds manure to beater evenly, aiding in uniform distribution. Shock - absorbing spring relieves spreader and horses of sudden strains.

Spreader only hip-high to top—easy to load. Big drive wheels—light draft. Ball-bearing apron drive—apron travel frictionless. Simple gear attachment keeps weight of load from making apron race when spreading up hill.

Easy to operate—only two levers—one lever determines number of loads spread to the acre; the other starts and stops the spreading. It's so simple, a boy can operate it.

Wide-spread attachment for extra wide spreading.

Write for booklet on the John Deere Spreader.

More Bales Per Hour at Less Expense

A saving is made in the cost of baling each bale, the press lasts longer and costs less to run when the John Deere-Dain Motor Press is employed.

John Deere-Dain Motor Press

Bales 1½ to 3 Tons Per Hour

This press puts out neat, well-pressed bales unusually rapidly because the gears are mounted off center—*a patented feature* found only on John Deere-Dain Hay Presses. Eccentric gears give the plunger and self - feed arms *more power on the pressure stroke* just when more power is desired, and a *quicker return on the idle stroke* when speed is more valuable than power.

The working parts are carried back out of the way with practically no effort on the part of the engine. This results in more uniform and continuous application of the power than can be obtained with any of the ordinary types of presses. *You get more bales per hour at less expense* under these conditions.

14x18, 16x18 and 18x22-inch sizes, with or without engine.

Big Book Free

Better Farm Implements and How to Use Them

America must produce more food. Labor-saving implements will play an important part in increased crop production.

This book tells all about a full line of labor-saving farming implements. Tells how to adjust and operate many of them. A practical farm implement encyclopedia. Worth dollars. Illustrates and describes the following machines: Walking and Riding Plows, Tractor Plows, Disc Plows, Disc Harrows, Spring Tooth and Spike Tooth Harrows, Corn and Cotton Planters and Drills, Listers, Alfalfa and Beet Tools, Grain Drills and Seeders, Riding and Walking Cultivators, Lister Cultivators, Mowers, Side Rakes, Loaders, Sweep Rakes and Stackers, Hay Presses, Grain and Corn Binders, Corn Cutters, Stalk Cutters, Kaffir Headers, Manure Spreaders, Portable and Inside Cup Elevators, Corn Shellers, Wagons, Farm Trucks and Buggies. This big book will be sent *FREE* if you state the implements in which you are interested and ask for Package X 640

John Deere Said

in reviewing his career, that he felt most pride in the consciousness that he never produced an implement of poor quality.

The same pride that John Deere felt is the pride of the makers of John Deere implements today. It is a powerful incentive to the maintenance of the high standard to which John Deere tools have been kept for eighty years.

Silo Conserves Waste Products.

Any Kind of a "Good" Structure Will Answer the Purpose and Effect a Great Saving of Materials.

IN TIMES like these, when every effort is being made to conserve food for ourselves and our allies, the live stock on the farm must not be forgotten. Our cattle, hogs, sheep, horses and poultry must also be fed. In a great dairy state like Wisconsin the chief feeding problem has to do with the dairy cattle. There are nearly 2,000,000 dairy cows in this state which must have nourishing food all this summer, all next winter and until another crop is raised to carry them through another year. A few of our most farsighted dairymen have helped solve their feeding problems

THOUSANDS OF SILOS WILL BE FILLED IN WISCONSIN THIS FALL.

with the summer silo—an extra silo in which good, succulent food has been stored away as a protection against short pastures and dry seasons. Others have caught on to the idea of buying feeds in the fall. Those who are able to buy in the fall in quantities save a good deal of money. Where one dairyman cannot handle a sufficient quantity to get lowest rates, it is best for him to buy coöperatively, combining his purchase with that of several neighbors. Thus car lots of feed can be secured, often at a very great saving. This plan is

A GOOD FORCE CAN PUT UP FROM FIFTY TO EIGHTY TONS A DAY.

especially good for those dairymen who need certain food elements to complete a balanced ration.

But our main dependence is farm feeds. The most economical plan is to raise the feed right on the farm, supplementing it with purchases needed to balance the ration, if any. The problem is often fully solved by careful planning in the matter of caring for the farm-grown feeds. This is a year in which we cannot afford to let anything go to waste. Furthermore, at this writing, we are face to face with a prospect of frost before our corn crops in Wisconsin can fully mature. The season in some respects is not unlike that of two years ago, when hundreds of dairymen late in the summer or early in the fall were sore at themselves because they had not erected a good silo or two to take care of their corn. Warm weather coming on after June 15th has done a great deal to bring crops up toward a normal condition, but "knee high" corn on July 4th is likely to be the exception all over our state. As it appears now, much of our corn will have to be put into the silo. The condition which confronts us is responsible for the "silo drive," now in progress in the Badger state, a summer campaign which, in point of importance, eclipses almost anything that has been done this season by the county agents and experiment workers.

Looking our present situation squarely in the face, there is apparently good foundation for this "silo drive." Wisconsin has 60,000 silos now, and the mere fact that silos are increasing by the thousands every year is evidence that they are worth while. About the best argument for a silo that we know of is that the successful dairymen have them, and in many cases now have two and even three or four where there is a large number of cows. There are thousands of farms in the state where there is one silo and where there should be two. Many silos are old and out of date—were not properly put up—and in too many cases were not the kind expected to last many years. The modern silo rests on a good firm foundation, does not need wiring to keep it from being blown down by the winds, is big enough to handle a large crop, and sufficiently ornamental that it will be in keeping with the other buildings about the farm.

The Wisconsin Farmer is often asked what kind of a silo is best for the Wisconsin farm. The following definition, given by the Wisconsin Experiment Station, expresses our idea pretty well:

A silo should be round and smooth on the inside, perpendicular from top to bottom and air tight.

Some of our readers will ask whether the silo should be built of concrete, or wood, or vitrified tile, or steel, or brick. This is a matter which we have to leave to the individual. There is merit in all of these silos. We are not so much concerned about the materials which are used for a silo as we are that the silo be built, and that it be large enough to accommodate plenty of feed. The matter of expense and durability must be taken into consideration. Our readers might as well ask us what make of automobile to buy. We could recommend a number of them. Selection of the exact kind of a silo is a matter of individual opinion, which must be governed to a great extent by circumstances. But good silos are made from any of the materials mentioned, and the more expensive ones we have found by experience are usually worth the added cost.

Corn is not the only Wisconsin crop which may be put with profit into the silo. Peas, waste from the pea canneries, oats and peas, soy beans with corn, beet tops mixed with corn fodder, chopped clover and corn, etc., make good silage. Other mixtures may be adopted, many introducing alfalfa, but corn usually is the base and chief element.

There may be those who will say that they have put money already into other things this year and will put off the silo for another season. This is false economy, provided you have roughage on the farm which the silo would accommodate and which your stock will need before pastures come around in 1918. It is just as reasonable and sensible to borrow money to build a silo as it is to borrow money to buy cows or build dairy barns. The writer finds before him a copy of a Wisconsin paper in which a banker urges the farmers of his county to erect a number of silos the coming year. "If you haven't the money, come down and see me and let's talk it over," is the message which this banker's advertisement carries. Money borrowed at the present rates of interest is well borrowed if it causes a modern silo to be erected and finally results in 100 tons or more of good, succulent feed being stored

MAKING "ENSILAGE" WHILE THE SUN SHINES.

away against the rigors of the coming winter. A silo, properly erected, of good materials, should last for many years. It is an ideal farm investment. It gives, according to scientific investigation, 20 to 30 per cent greater feeding value to corn than the same corn would have if fed as dry fodder. It provides feed at a time when dairy prices are highest and milk flow is most desired and most profitable. It is insurance against short pastures and dry seasons. It is also insurance against losses which might otherwise come from early frosts. The silo helps the farmer to make the best possible use of frosted corn. Even immature corn can be saved by putting it in the silo. Silage in connection with grain may be well used to fatten stock for market. The silo furnishes the cheapest winter feed obtainable. Where a man feeds twenty or more cows the silo pays for itself in feed saving in a short time—two or three seasons at most—and often in one season. The silo helps use up all the corn, with least possible waste. The man who properly cares for his silage can feed his cattle on less acres and this means more acres for marketable crops. The silo is the best friend of the dairyman, because silage, properly fed, and included in the ration in proper proportions, does not injure the quality of milk, nor have any deleterious effort on milk products, such as butter and cheese.

While others are thinking it over, make up your mind to build a silo now. You will thus be ready for any eventuality.

City Delivery and High Milk Prices.

Each morning three milk delivery wagons drive the distance of the same city block. Each of them regularly delivers one pint of milk to a residence within that block. Apparently the cost of delivery constitutes a considerable portion of the amount that each of those three customers is required to pay for the milk. One wagon drawn by one horse could deliver the three bottles of milk as well as three can do it. The extra time required would not consume one hour of time per month. Yet the three customers are paying for the use of three wagons and three horses and are paying high prices for three delivery men.

In a city under 100,000 in population an observer has found that no less than twenty-two milk wagons pass a certain street each day. It is apparent that there is an immense waste of time and expense in this, all of which goes to increase the cost to consumer and to decrease the profit to the producer.

The expense of delivery is seldom carefully tabulated. However, two brothers who operate a dairy of eighty or 100 cows have adopted the following plan: One brother stays on the farm. He produces the crops, pays for the extra feed. He does the milking or hires it done and delivers it to the depot in the city. The other brother does the delivering of the milk and collecting of accounts. Each receives exactly half the income for handling the delivery business. The one in the city shares fifty-fifty with the brother on the farm. One not well informed in regard to the expense of delivery might think that the brother in the city would have the best of the bargain. Such is not the case, however, according to a sister who keeps the books for the firm. She gives it as her opinion that the brother on the farm actually makes more clear money than the one in the city.

City dealers retail milk at about double the price they pay the farmers, yet they frequently do not appear to be succeeding very well. Could some more economical method of delivery be worked out it would be to the advantage of both consumer and producer. The city or town customer would be enabled to secure milk at a lower rate. The producer would doubtless be able to increase his margin of profit while reducing the price to his patrons. Furthermore, a lowering in price would doubtless induce a greater consumption which the dairyman very much deserves. Whatever plan may be developed will require team work. It may be a common delivery wagon with the patron selecting the dairy the milk from which he is to be supplied. It may be a coöperative standardized union of dairymen. It is certain that practical, thoughtful dairymen will be able to meet this condition which is a hardship upon themselves as well as upon their customers.

Inspecting a Good Dairy Herd.

To the Editor:—A call came to me to go away up into the state to get the facts about a cow that had just made a world record for butter. I was glad to go. It always does a man good to step out of the home furrow for a little while and get a glimpse of what his neighbors are doing. It sets the current of thought to flowing in a different direction and sharpens up the appetite for new and better things.

A few things I saw on the way that day have been in my mind ever since, and because they helped me, it may be that they will be of value to others. While we may not always look through the eyes of our fellows, we do get hope and help and inspiration from the methods and the opinions of those who are out in the world where things are being done.

The man who keeps his eyes open cannot help seeing that dairy farming brings comfort. As I slipped along between the hills and through the valleys, a variety of landscape passed before my eyes. Now I would be cheered

by the sight of a stretch of country where everything looked prosperous. The houses and barns were all painted and up in good condition, the fences were in fine order, and all as neat as a pin. I could make a pretty fair estimate as to the degree of prosperity which was coming to the farmers of such sections; and it was apparent that dairy farming was the means of making all these improvements, and I had no doubt that most of the landowners were putting aside some money against the coming rainy day. Then, perhaps in a few moments, the train would switch me away through a strip of country that lacked this thrifty appearance. Fewer cows were in the pastures of those farms; the buildings were less attractive; my conclusion was that for some reason dairying had been displaced by some other line of farming, and the contrast placed a long credit mark down to the advantage of the cows. Dairy farming is a good foundation stone for farm success. It brings peace and comfort.

At the farm where I found the cow with the world record, I got a new insight into the value of good care, scientific feeding and a big ambition. The farmer whose cow was at the time being tested out was under the care of an expert, who watched her as a good engineer might the locomotive which is to bring him safely to the end of his journey with his precious freight. Every pound of food was carefully weighed. The body of the cow was safeguarded as a skillful physician might care for a patient, so that she might not get off her feed, but do the best possible work. At night a trusted hand slept in the barn, to make sure that there was no tampering with the cow by any jealous or scheming person. Not a thing was overlooked that would enable the cow to do her best. The milking was carefully done, with all noises hushed and nothing to distract attention.

A HOLSTEIN WITH A THREE-YEAR-OLD RECORD OF 533.1 POUNDS OF MILK AND 23.24 POUNDS OF BUTTER.

And what was the result? Here are a few figures as given me by the owner of the cow, Mr. Eugene La Munion, Solsville, N. Y.

At two years, eleven months and twenty-one days, the young Holstein cow, Lockhart De Kol, in seven days gave 566.9 pounds of milk, making 29.27 pounds of butter. In thirty days she gave 2,415.9 pounds of milk, from which 116.53 pounds of butter were made. As a senior three year old in seven days this cow made 30.56 pounds of butter. For nearly four years this cow held the world record.

Another cow of the same herd, Lockhart Bessie De Kol, at three made this record: In seven days she gave 533.1 pounds of milk, with 23.24 pounds of butter. A picture of this cow is given.

Now, the point I wish to bring out is: What would it mean if all the dairy cows of this country were to be so cared for all the time, and not for a few days at a time when a big record is desired? What a revolution it would make in the dairy business of the world? And why should not this be done? If it pays one man to care for his cows well, why not all of us?

Another good thing came to me as the result of my visit to this farm, and that was the value of a big dream. A few years before that Mr. La Munion had a few very commonplace cows. None of them could be expected to do anything very great. He was badly in debt and the prospect for getting out was not very good. Then he had a dream of the better cows he might get about him. He started out to see what he could do. He bought a few thoroughbred cattle. He bred to the best available sire. The day I was at his place he had sent a cow away to be bred at a cost of $100. From that small beginning this young man has done things that have given him a standing among the world's breeders. Most of his neighbors have been helped, too, for where one man succeeds in rising above the level of the common herd, soon others will follow. So all along the valley one may now see better herds.

Coming home through the shadows of the closing day, I saw men driving their cows home to be milked. It was interesting to note the difference in their way of doing things. As it grew late, some were hurrying their cows along at top speed. Here and there I would see a dog chasing cows with udders pressed hard with milk, snapping, yelping and harrying the poor victims. Boys in full chase, clubbing, throwing stones, yelling till the dogs must have envied them their ability to hurry and worry the herd. We all know what is the effect of such treatment when it comes to the milk pail and the Babcock test. Why should any of us ever permit our cows to be harried this way?

But not all do. I saw other men going home with the cows that night and doing it as if they realized that a good part of the proceeds of the day's work depended upon the condition of the herd when it reached the stable. The cows appreciated it, too. Some of them were chewing their cuds as they quietly wandered in from the pasture; now and then one stopped to pick a fresh bit of grass; if there was a dog anywhere around, he was making no noise about his job. Once in a while he might rub up against the legs of some laggard cow, as a gentle hint to her that it was time to get along to the barn, but there was no sign of nabbing, no barking, no worrying.

And I came home convinced that the difference in the success men reach is very largely a matter of the man and his methods. E. L. Vincent.

COW-EASE GUARANTEED TO MAKE GOOD OR I WILL!

MY personal money-back guarantee is back of every can. Cow-Ease is not an experiment, but a tried, sure fly-repellant that has made good for sixteen years. I originated it and I *know* that

COW-EASE

Keeps Flies off Cattle and Horses

It is an absolutely harmless liquid—applied with a sprayer. It does not gum the hair or blister the skin. Its cost is trifling, and a gallon will spray a cow over 200 times.

Cow-Ease positively keeps flies away and keeps your cows quiet and contented. You reap the benefit in more milk and *better* milk, and in easy milking. Flies not only irritate your cattle and reduce the milk yield but they are ladened with deadly disease germs. Get rid of them.

Thousands of farmers and dairymen are using Cow-Ease to their profit. Why not you? Remember I personally guarantee satisfaction or "your money back." Ask your dealer for Cow-Ease to-day.

M. Elton Rose Vice-President.

CARPENTER-MORTON CO. 87 Sudbury St., Boston, Mass.
Manufacturers of Cow-Ease. Established 1840.

TRIAL OFFER If your dealer cannot supply you, send me his name and $1.25, and I will deliver prepaid to your address a half-gallon can of COW-EASE and SPRAYER for applying. For west of Missouri River and Canada, above Trial Offer, $1.50.

The President Says:

"It is of the most imperative importance that everything possible be done and done immediately to make sure of large harvests."

Conserve and Increase Your Forage Crops

Turn under part of your pasture and plant it to saleable crops. Feed your stock this winter cheaper, easier and more profitably with a few acres of corn cut into ensilage with a Kalamazoo Ensilage Cutter and stored in a Kalamazoo Silo. Stop wasting land that should be used for money crops. This year, you have a chance to make *big profits.*

Kalamazoo LIFE-TIME-SILOS

are built to meet the exacting farmer's needs. Best in design, material and workmanship. Have every desirable feature a silo should have and embody the "know how" acquired through more than twenty years experience in silo building.

Wood Stave Silos—Your choice of four of the best time-defying woods. Kalamazoo Silos are manufactured complete ready to set up. Quickly and easily erected by inexperienced home labor All Kalamazoo silos are made with Galvanized Steel Door Frames and continuous doors, forming a safe ladder entire height of silo.

Write today for our free descriptive booklet. If interested in an Ensilage Cutter; ask for Kalamazoo Cutter catalog. *Easy payments,* if you wish.

APPLETON Silo Filler

In quantity and quality of silage made per hour

the Appleton has any silo filler beat, by actual *records.* Great capacity, with tremendous strength to stand the hardest, continuous service, made Appleton the choice of those thousands who *investigated* it before they bought *any* silo filler. Have *you* investigated it?

Guaranteed to do more and better work with less power

than any other silo filler. Costs no more to buy and much less to operate. Its all-round economy guarantees you silage at the lowest cost per ton and makes you most profit on work for others. Don't buy until you *know* what Appleton offers. Send for

Two Free Books

about silo building and silage; and about Appleton Silo Fillers, showing 4 sizes for 4 h. p. gasoline engines and up.

Appleton Mfg. Co., 4122 Fargo St. Batavia, Ill.

Use A Wood Tire Hollow Wall Silo

Cannot Sag, Blow Down or Rot.

Cures and preserves silage perfectly. Prevents freezing of silage. Easy to construct. A real farm building, permanent and rigid. No hoops to get loose. No guy wires. No staves to shrink or swell, but a smooth, double wall from base to roof, the inner wall being of *California Redwood.*

Guaranteed for 20 Years

"But Lasts a Lifetime"

WOOD TIRE
AIR SPACE
INNER WALL
OUTER WALL

The patented wood "tire" is built up of inch boards, and shipped in sections. The boards overlap in step formation at both ends. When nailed together, these sections form a ring of unusual strength. The silo frame forms its own scaffolding.

Send for our folder which shows how the Wood Tire Silo is built, and also what owners think of them. A postal brings it. Write today.

Still Another Way to Preserve Vegetables.

We have received the following letter from one who is interested in food preservation:

I have been a reader of the Home Department for over a year and now I would like to ask some advice. I want to can some beans and I have been wondering if they can be put up like kraut. I am a girl eighteen years old and if I could secure this information it would help me a great deal.

String beans, beets, cabbage, cucumbers and other garden crops may be preserved by what is known as the fermentation method. The vegetables are not cooked, but are put down in a salt brine in any non-metal water-tight container and are sealed up with paraffin and are otherwise made air-tight. Under this treatment lactic acid will develop and this acid, the value of which as food has been recognized, acts as a preservative.

The strings should be removed from string beans before they are put up. Beets, of course, and cucumbers, require careful washing to remove all dirt before brining. After being so prepared, pack into a clean, water-tight barrel, keg or crock. On the bottom of the barrel place a layer of dill weed and a handful of mixed spice. Add another layer of dill and another handful of spice when the barrel is half full and when almost full add a third layer. If a keg or crock is used, the amount of dill and spice can be reduced in proportion to the size of the receptacle. When the container has been filled within a few inches of the top, add a layer of covering material—beet tops or grape leaves—about an inch thick. If any spoilage should occur on the surface, this layer will protect the vegetables beneath. Press down with a clean board weighted with bricks or stone. Do not use limestone or sandstone.

Make a brine by adding one pound of salt to ten quarts of water. To each ten quarts of brine so made add two-thirds of a quart of vinegar. The vinegar is used primarily to keep down the growth of injurious bacteria until the lactic acid ferment starts, but it also adds to the flavor. Add sufficient brine to cover the material and allow it to stand twenty-four hours. Then make air-tight. The time necessary for complete fermentation to occur depends upon the temperature. In a warm place only five days to a week may be necessary; in a cool cellar three to four weeks.

There always will be more or less bubbling and foaming of the brine during the first stages of fermentation. After this ceases a thin film will appear which will spread rapidly over the whole surface and develop quickly into a heavy, folded membrane. This scum is a growth of yeast-like organisms which feed upon the acid formed by fermentation. If allowed to grow undisturbed it will eventually destroy all the acid and the fermented material will spoil. To prevent this scum from forming it is necessary to exclude the air from the surface of the brine. This should be done by either of two methods, twenty-four hours after the vegetables have been packed.

Perhaps the best method is to cover the surface—over the board and around the weight—with very hot, melted paraffin. If the paraffin is sufficiently hot to make the brine boil when poured upon it, the paraffin will form a smooth, even layer before hardening. Upon solidifying, it effects an air-tight seal. Oils, such as cottonseed oil or the tasteless liquid petroleum, may also be used for this purpose. As a measure of safety with crocks, it is advisable to cover the top with a cloth soaked in melted paraffin. Put the cover in place before the paraffin hardens.

The second method, which may be used with barrels or kegs, is to pack the container as full as possible and then replace the head. In using this method for fermentation of beets, cucumbers or string beans, add the board and weights as described above and allow to stand for twenty-four hours before heading. During this period most of the gas first formed escapes and the container then may be headed up tight, first removing the board and weights. Then bore an inch hole in the head and fill the barrel with brine, allowing no air space. Allow bubbles to escape. Add more brine if possible, and plug the vent tight. If the barrel does not leak, fermented products put up in this manner will keep indefinitely.

After sealing with paraffin the containers should be set where they will not be disturbed until the contents are to be used. Any attempt to remove them from one place to another may break the paraffin seal and necessitate resealing. If the containers are not opened until cold winter weather, the vegetables should keep without spoilage until they are used up. If opened in warm weather they are likely to spoil quite rapidly unless the paraffin is reheated and the container resealed immediately. In the case of cucumbers and chayotes, it is preferable, if enough material is available, to use the method of packing in kegs or barrels.

Only those vegetables which cannot be kept by storing or early ones that are not available later in the season should be preserved. Late beets, for example, can be better kept in the cellar.

The method of putting up cabbage by fermentation has a number of advantages over the present process of making sauerkraut.

In the case of such vegetables as beets or beans, if it is desired, when they are to be eaten, to wash out the brine and serve as fresh vegetables, the addition of the spice when they are put up is not necessary.

The Baby's Sleep.

During the first month of its life a baby needs twenty hours of sleep a day, and thereafter not less than sixteen hours a day up to the end of its first year. It should sleep alone in a crib or basket. A clothes basket with a simple mattress made of excelsior and covered with a heavy blanket makes a good substitute for a crib while the child is small.

The room in which the baby sleeps should be darkened and well ventilated, the windows being lowered from the top. If it cries and refuses to sleep under these conditions, then it is time to look for the cause, for it is probably sick or overfed or maybe hungry.

All children should take a nap of from one to two hours in the middle of the day until they are six years old.

Corn Salad.

To the Editor:—It is a little early for a corn salad recipe to be used, but if all the subscribers are like me and keep all of the papers—not only the Home page but all of it—it will be all right.

For this salad use four quarts of green corn cut off the cob, one large head of cabbage (chopped), two onions, one and three-fourths pounds of sugar, one-half cupful of salt, two quarts of vinegar, one-fourth cupful of ground mustard, two or three green peppers, and about two teaspoonfuls of celery seed (more if you wish). Cook the cabbage and peppers separately. Cook the corn with one quart of vinegar. Then mix these and add the onions and all other ingredients, except the mustard, and cook again. The mustard should be mixed with enough vinegar to make smooth and add just before canning. Can hot in glass jars.

Can't some of the readers tell us some new lettuce dishes—some that they have tried and found good?

Ida M. Vinsom.

Made Scrapbook For Recipes.

To the Editor:—I have been a reader of your paper for many years and have received much help. I have made a scrapbook for the recipes I most needed, putting cakes in one part, pies, puddings, canning, each in a part by themselves. It is surely handy, not only for myself but for younger members of the family.

I wonder if someone would not be interested in the way I put corn down in salt. I cut the corn from the cob and use one part of salt to seven of corn. I mix it well and pack in stone jars, cover with a cloth and plate and weight down.

To freshen corn put down in this way take as much as is needed from the jar, draining the brine back. Cover the corn with cold water and let come to a boil; drain and cover with water again. Repeat this three times. Then drain and season as you would canned corn.

Grandma.

Recipes.

Buttered Rice With Peppers.—One cupful rice, two quarts boiling salted water, two sweet green peppers, two tablespoonfuls butter. Cook the rice in the boiling salted water twenty minutes or until tender, but not broken. Drain in a colander and set in an open oven for five minutes to dry off. Seed the peppers and chop fine. Put butter in a frying pan over the fire and when it hisses add the minced peppers; toss and stir until smoking hot all the way through. Put the rice into a dish and pour the peppers over it, loosening the mass with a fork to allow the sauce to penetrate.

Potato Salad.—Three cupfuls cold diced potatoes, two cold boiled eggs, one medium-sized Bermuda onion, three-fourths cupful salad dressing, one cupful whipped cream. Dice potatoes, chop onions, chop egg white and cut yolk in small pieces. Blend with salad dressing and whipped cream.

Orange Froth.—Juice of one orange, juice of one lemon, grated rind of one-half orange, three eggs, one cupful sugar. Beat the yolks of the eggs until light and add the sugar; beat to a cream. Add the orange and lemon juice and cook in a double boiler until it boils, stirring constantly. Have the egg whites beaten stiff and pour over them the hot sauce, beating all the time. Cool and put in glass cups, from which it is to be served, and set on ice.

Lemon Sherbet.—Two quarts milk, one and one-half pounds sugar, juice of six lemons. Mix sugar and milk together; put in freezer, and when partly frozen add lemon juice and freeze like ice cream. The grated rind and juice of two oranges may be added to the above if desired.

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

A Fishing Trip.

Dear Young Folks:—As I have never written to your page before I am going to now. I enjoy reading the letters so much.

I live on a 120-acre farm three miles from the city. I am eleven years old and am in the seventh grade. I have two brothers and one little sister going to school. We have to walk a mile and a half to school.

I help my mother in many ways. I can sew, bake, scrub, crochet and also cook some plain things.

I will tell you about my trip fishing for perch. One day I went fishing down by the harbor with a bunch of girls. We went at six o'clock in the morning and came home about half past five in the evening. We took our dinner with us. In the afternoon a man took us in his big boat and gave us a ride around the bay. It was a very pleasant ride. In the evening my father came after us with the horses.

We have a gasoline engine and also a threshing machine and engine. We have four horses and fifteen head of cattle. I have a pet dog. He is a shepherd dog and his name is Captain. He is very kind and my little brother can put his hand in his mouth and he won't bite. In the winter we hitch him to a sled. He can pull three of us on a sled. He is getting pretty old now, but my father will not kill him for my sake and my brothers'.

I have a garden of my own. I planted lettuce, carrots, and radishes and my mother is going to give me some tomato and celery plants.

I send my best regards to all the young folks and hope they will make our page better every week.

—Evelyn.

Came Over the Rockies

Dear Young Folks:—This is my second letter to the Young Folks' page. I was born in Portland, Ore. Papa, mama and I came over the Rockies when I was seven weeks old. My papa has taken this paper for several years and I enjoy reading your letters.

I live on a farm of 160 acres. We have a spring in the pasture that runs water the year round. Our farm is tiled also. I have a pony whose name is Cricket. He is very gentle, and I like to ride him. I have two little brothers and one sister. I put all three of them on my pony at once. I like to ride him to the field and pasture and to school.

Mama has twelve geese. We have got over forty eggs. I went to town school all my life until a year ago when we moved to the farm. I don't like the country school very well yet. My sister and I have a mile to go to school. I find it quite different from the school in town. I am eleven years old and am in the sixth grade.

I like to help mama sew and I like to cook, too. I like to make pies, cakes, cookies and candy. Here is my recipe for chocolate fudge. One cupful milk, two cupfuls of sugar, one-fourth cake of chocolate, butter the size of a walnut. Cook until it hardens, remove from stove and beat until it thickens.

—Leta.

Made a Bird House.

Dear Young Folks:—I always like to read the letters the little boys and girls write. This is the first time I have written to you. I am a little girl nine years of age. I have a little sister two years old. Her name is Ruth.

My papa and I made a little bird house and set it on a post in our front yard. One day I went to the garden to see my flowers and I saw a little bird close to the house. I think it has built there. When I put the house up I put some pieces of cake by it.

I like all the little folks who write to our page.

—Margaret

Caught a Little Rabbit.

Dear Young Folks:—I have never written to you before and I am going to tell you about my pet rabbit. I am eleven years old and in the seventh grade.

Once upon a time I was catching mice under corn fodder that my uncle was moving and a little rabbit ran out. I started after it, but I lost sight of it for a while. When I saw it again I ran after it and overtook it. I took it home and put it in a box. It stayed in the box for two days and then it jumped out, but I knew it was in the house. The next day my uncle told me that it was under the stove and I could catch it and play with it. I am going to keep it as long as it lives because it is a nice pet.

—Russell.

Likes to Read.

Dear Young Folks:—My brother farms 160 acres of land but only owns 160 acres. We have five cats. Their names are Bunny, Mouser, Chinky, Starlight and Lollypop. Our horses' names are Prince, Queen, Jim, Bud, Prince and Fan—we have two horses named Prince.

Do any of the young folks like to read books? I do, and I will tell you some dandy ones. Babes in Bloomland, Somebody's Little Girl, The Christmas Stocking, Live Dolls' Party Days, and Billy Whiskers, Jr.

—Elizabeth.

Names For Arnold's Lambs.

Dear Young Folks:—We are cousins. We saw Arnold's letter and we are going to give his lambs names. We hope they will suit him. We thought he could name them Muffie, Fluffie, Snowball and Cupid.

We are eleven years old and think we will be promoted to the sixth grade. We each have a little sister.

Eunice and Gladys.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Inclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date 1917 spring and summer catalog, containing over 550 designs of ladies', misses', and children's patterns, also some points for the needle. Address all orders for patterns and catalogs to THE FARMER AND STOCKMAN, Kansas City, Mo.

1653—Girls' dress, with or without pockets and with sleeve in either of two lengths. Pattern is cut in 4 sizes: 2, 4, 6 and 8 years. It requires 2¼ yards of 44-inch material for a 4-year size.

1415—Boys' blouse suit with straight trousers and with or without shaped band. Pattern is cut in 4 sizes: 3, 4, 5 and 6 years. It requires 2 yards for the blouse and 1⅛ yard of 27-inch material for the trousers for a 3-year size.

2112—A new and attractive model. Pattern is cut in 4 sizes: 4, 6, 8 and 10 years. It requires 3½ yards of 44-inch material for an 8-year size.

Coat 2114-Skirt 2113—A seasonable and popular style. The coat 2114 is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 2113 is cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. It will require 8⅝ yards of 44-inch material for the entire suit, for a medium size. Two separate patterns, 10 cents for each pattern.

Waist 2125-Skirt 2105—A smart summer frock. Waist pattern 2125 is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 2105 is cut in 6 sizes: 22, 24, 26, 28, 30 and 32 inches waist measure. For a dress in a medium size, it will require about 5½ yards of double width material. Two separate patterns, 10 cents for each pattern.

1723—A neat and practical model. Pattern is cut in 3 sizes: Small, medium and large. The medium size will require 5⅛ yards of 36-inch material.

2128—A stylish, attractive model. Pattern is cut in 3 sizes; 16, 18 and 20 years. It requires 5½ yards of 44-inch material for an 18-year size.

2103—A practical work dress. Pattern is cut in 7 sizes. 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 6¼ yards of 36-inch material for a 36-inch size.

1928—A smart and practical ladies' skirt. Pattern is cut in 7 sizes; 22, 24, 26, 28, 30, 32 and 34 inches waist measure. It requires 5⅝ yards of 27-inch material for a 24-inch size.

1673—Girls' middy dress with skirt attached to an underwaist, and with sleeve in either of two lengths. Pattern is cut in 5 sizes: 4, 6, 8, 10 and 12 years. It requires 4⅛ yards of 40-inch material for an 8-year size.

2130—Girls' dress with two styles of sleeves and with or without bolero. Pattern is cut in 4 sizes; 6, 8, 10 and 12 years. It requires 1⅛ yards for the bolero, and 3¾ yards for the dress of 27-inch material, for a 6-year size.

1919—Ladies' shirt waist. Cut in 7 sizes: 34, 36, 38, 40 42, 44 and 46 inches bust measure. It requires 2¾ yards of 36-inch material for a 36-inch size.

Save the Fat.

The increased prices of butter, lard, and all other fats bid fair to go still higher. Dr. Louise Stanley, of the University of Missouri College of Agriculture believes that the shortage can be relieved considerably by saving much of the fat which is usually wasted in the home. Such saving may avert a deficit of this important foodstuff which accounts in part, it is said, for the inadequate diet of the German people. Investigations of additional sources of fat are being made; but it remains for the housekeeper to conserve the available supplies.

The familiar grease trap stood for many years at the foot of the sink as a definite testimonial of the fat wastage which passed out of the house by that route. The garbage can and the slop bucket give further evidence. Some of this waste is unavoidable perhaps, but much of it can be saved and every housewife should appoint herself that task.

Efforts should be made to utilize the fat which comes into the home in the form of fat meat. Much of it is rendered as the meat cooks. This should be clarified and saved. Serve a piece of fat and a piece of lean if the family will eat fat. Otherwise save the fatty portions so that the fat may be rendered and used instead of lard.

The fat which cooks out from bacon should be carefully treasured. If it is not scorched, it may be used for corn bread, muffins, griddle cakes, in salad dressing, to season vegetables, and in numerous other ways.

Chickens in good condition usually yield more fat than is palatable to serve with the meat or soup. The excess may be used acceptably wherever any other fat is used. It has been recommended as especially desirable for pastry. On account of its consistency it may be mixed with harder fats to make them all more soft.

Soup should be set aside to cool so that the fat may collect in a cake on the surface. This may be placed with the fat to be clarified.

Water may be used in clarifying fat. The amount to be added depends upon the degree of impurity of the fat. Heat only until the fat melts and then stir well. The fat separates as a more or less clear layer on top while the water dissolves out much of the impurity from it. If the fat contains sediment, it can be removed by straining while hot through double cheesecloth. If objectionable odors and flavors are present, they may be removed in many cases by heating the fat with small pieces of charcoal.

Fats should be kept free from water in closed opaque containers in a cool place. Rancid fats may be kept for soap making.

"If every housekeeper will pledge herself 'to save the fat' we need not fear a fat famine in our country," said Miss Stanley recently. "If we continue in our reckless waste of this valuable food, the amount is likely to fall far short of our needs and the price will be unnecessarily increased. Will you do your part to keep up the supply and keep down the price?"

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for July 1, 1917.

Isaiah's Call to Heroic Service.

LESSON TEXT—Isaiah 6.

GOLDEN TEXT—Also I heard the voice of the Lord saying, "Whom shall I send, and who will go for us?" Then said I, "Here am I; send me."—Isa. 6:8.

The lesson committee now turn for a third quarter's lesson to a series of studies in the Old Testament as found in II Kings, Ezra and Nehemiah. As an introduction, they have chosen this chapter in the book of Isaiah.

Isaiah prophesied in the latter half of Uzziah's reign, B. C. 760 and down to the early years of the reign of Manasseh about B. C. 694 (ch. 1:1). This event took place probably B. C. 775. The place was Jerusalem; the kingdom of Israel was still in existence (for thirty-three years longer) being utterly destroyed in B. C. 721. The name Isaiah means "the salvation of Jehovah;" his wife is called "the prophetess;" two of his sons are named and his social position was high, as shown by his intimacy with kings. Isaiah lived in troublous times. He was a reformer seeking to rescue his nation from the sins growing out of their disobedience to God. He was the leading statesman of his time, the greatest of the prophets, an author, a heroic, single-minded, patriotic, fearless, undaunted man of great personal power and influence. He was a prophet of hope; he wrote out of his long life of faithfulness and fellowship with God. The book of Isaiah falls into two great divisions; chapters 1-39 being chiefly historical, interspersed with songs and poems; chapters 40-66 are a collection of prophecies that have to do chiefly with the return from the Babylonian exile and the days of future glory for the kingdom of God.

I. Visions (vv. 1-4). As we have said, Isaiah prophesied in a time of great need. The prophet was very much discouraged. In this passage he locates his vision at a special time and place (ch. 1:1). Every man's great need today is a real vision of God. We are not so much in need of theories about God, as a vision of God himself. Uzziah's long reign of fifty-two years, in which the kingdom prospered and the king's name was spread abroad, stopped as suddenly as an earthquake, and his glory was eclipsed (see II Chron. 26:16-19). The place in which Isaiah saw his vision was the house of God. Perhaps not in the temple, but seeing the vision from the temple the prophet looked to a house not built with hands, Jehovah's own heavenly palace. Therein he saw "the Lord sitting on a throne . . . and his train filled the temple." Above it, or around it, were arranged hovering couriers and the seraphic choir. The majesty of this vision is indicated in verse two, its glory in verse three and its power is indicated in verse four. The whole earth was filled with God's wondrous wisdom, love and power. Literally "the whole earth is full of his glory." The Hebrew word for holiness comes from a word meaning "to set apart—set a distance from." The holy Lord is not only sinless, but he is sublime and absolute also. It may seem difficult to harmonize Isaiah's vision with John 1:18, yet these manifestations were one and the same, for all that saw Jesus saw God (John 14:9). King Uzziah was dead, but the real king was living still, high and lifted up. The attempt to reason about him, what he must be and what he must not be, as if he were one of ourselves (Eph. 1:20, 21) is absurd.

II. Divisions (vv. 5-13). (1) The vision of the prophet (vv. 5-7). This vision brought conviction because it showed how far separated from God the prophet was. It also brought conversion in that he acknowledged himself to be unclean, himself and his surroundings to be vile. It also led to cleansing, for the king heard the voice of the prophet, removed his guilt and purged his sin. (2) The voice and proclamation from the king (vv. 8-13). The king called for a messenger (v. 8) and at once the prophet is found. Someone has said that "a task without a vision is drudgery; a vision without a task is a dream; while a task linked to a vision will move the world." Not only did the king ask for a messenger, but he gave the message which the messenger was to utter (vv. 9-12). The message was to be to his own people; it was not to be a pleasant one. Verse 13 shows us this message in prophecy. Isaiah ought to fully proclaim the truth, but the people would not understand it, and the whole effect of his proclamation would be to harden them.

The Application.

What is your application of this vision for Isaiah? We are a Christian nation, but there are many degrees and kinds of Christians; those who sincerely try to follow Jesus; those who live under a Christian government, and are unaffected by Christian influences. There is only one way to save this nation from going the way of Nineveh and Tyre; that is, that justice and righteousness shall govern, and that justice and righteousness shall be the fruit of regenerated lives. The cry is for a better social environment and a more just social position.

Some families take pride in serving lavish and overbountiful meals and overgenerous service of food. This leads inevitably to waste of food on the table and is a temptation to overeating, which often impairs health and efficiency.

UNCLE SAM WANTS AUTO EXPERTS
YOU CAN QUALIFY IN 6 WEEKS TO DRAW BIG PAY.
The government is paying high salaries to trained auto experts — to men who can drive a pleasure car, truck, ambulance, motorcycle or any other motor-driven vehicle—to men who know how to find and remedy trouble if anything goes wrong.
Milwaukee Motor School
Graduates are in the U. S.
Service at good pay
Preference is always given to trained men—particularly to auto mechanics. Food, munition and supplies will be moved by men who can best drive and care for automobiles; and for such service you can draw better than soldier's pay.
We use no books— you get practical work on all makes of cars, trucks, etc —you do the work yourself under the direction of Mr. Arbelger and other auto experts.
Write us for free book and details telling how you can make big money as an auto expert.
Wm Arbelger
Graduates the Milwaukee Motor School has turned out recently have passed Uncle Sam's rigid examination for auto experts.

Warm Weather Helps the Crops.

Although Small Grains and Corn are Backward, Good Warm Weather Will Put Them in Good Shape.

Crop reports from Wisconsin counties indicate an increased acreage of corn and spring wheat. Spring wheat is in good condition, corn somewhat backward, but picking up wonderfully well since the summer weather started. Pastures and meadows also show a splendid improvement, although they have come on a little late. In the main, crops have gained considerable in the past week.

WISCONSIN.

Barron County.—The crop situation is rather backward. About 15 per cent increase in wheat and buckwheat. Small increase in corn and potatoes. Hay is very backward and prospects are for a short crop. All garden truck is late. Small fruit is fair. Very little hay left on farms. Stock is in fairly good health, but pasture is short and stock does not pick up very fast. We are badly in need of warm weather.—Wm. Bartlett.

Burnett County.—The weather continues cold and on the 15th we had a heavy frost which did much damage to corn, potatoes, beans and tender garden truck, especially on light, sandy soil, while others report but little damage. Wheat, barley, rye and oats are looking fine and have an acreage of about 5 per cent more than last year. The hay crop, both tame and wild meadow, is much in need of rain, as are pastures, also, though they are in fairly good shape and cattle are fine. There are about the same number of cows as last year, but probably 10 per cent less young stock on pasture. All are in a good condition of health.—A. G. Peterson.

Crawford County.—The weather has been cold and wet for the past two weeks, but is now warming up nicely. Oats, wheat and barley look well. Rye is thin on account of the dry spring—it did not stool the way it should. Corn is a good stand, but backward, but with warm weather it ought to make a good advancement. Pasture is good. Meadows will be better than expected. There are fewer cattle in pasture than usual, but they are in healthy condition. Garden truck is good and fruit promises a good crop.—George Ashbacher.

Forest County.—General crop conditions are good, though the season is late and cold. With warm weather from now on a good average crop is in sight. The crop acreage has increased about 25 per cent, including new lands put under cultivation. It is safe to say potato acreage has been increased 50 per cent in this manner while the small grains have increased from 5 to 10 per cent. Meadows show a condition of 90 per cent and small grains 85. Live stock is doing remarkably well, owing to the splendid pastures and also to the absence of flies and insects.—K. A. Kamm.

Grant County.—Small grains, such as oats, barley and wheat, are looking fine. Corn is most all up, but is slow in growing. Have had much rain up until the last few days and also cold weather. Pastures are fine. Hay looks to be a good crop. Gardens are doing well in most cases, although some things are very late, due to the cold. From all appearaices there will be a large amount of fruit. Orchards are full now. The number of live stock on pasture is about as usual.—A. Vesperman.

Green Lake County.—All small grains have been doing very well lately and are about equal in condition and acreage to last year with the exception of barley, many fields of which have a very light stand. Corn has germinated very well, though in need of more warm weather. There is an increase in the acreage of beans and potatoes. Hay and pastures are good. Live stock looks well and a larger percentage than usual is being raised.—G. B. W.

Iron County.—Weather conditions are fine and all crops are looking well, but are two weeks behind. Meadows and pastures are improving. There are about 25 per cent more potatoes planted this year than last. Live stock is in good condition.—J. A. Becker.

Juneau County.—There is perhaps a 25 per cent increase of acreage sown to spring wheat and 10 to 15 per cent increase of winter wheat and rye, with oats and barley about normal. Corn will be a 10 to 15 per cent decrease in acreage on account of bad weather conditions. Some fields will be sown to buckwheat. Pastures are good and hay will be good. Gardens are good and fruit trees set full of fruit. All live stock in good healthy condition and pastures carrying their full quota.—J. H. McNown.

Kenosha County.—Small grain is looking excellent and meadows are improving very fast. Corn is coming up pretty well, but cold weather has retarded growth. Some corn to plant yet. Sugar beets are growing well and thinning is well under way. Cabbage plants are scarce. Many patches have been destroyed by insects. This will cut down the acreage some. Pastures are good and stock is doing fine. Potatoes are looking well. Prospects are for a good crop.—Geo. Krenscher.

Kewaunee County.—There will be a very large acreage planted to corn. A large percentage is to be or has been replanted. Small patches of spring wheat are seen on a great many of the farms. Barley is looking fairly well. Some fields of peas look fine. Oats look more sickly. Although short, the hay crop shows a good stand. Garden truck is very backward. Pastures are fair and cows are doing fairly well. Young stock not housed has suffered on account of cold and damp weather, yet they are doing nicely. Indications point to a good apple crop—Fred Lutz.

La Crosse County.—Small grains are looking well. Corn is backward on account of cold, wet weather. Cutworms have done much damage to field and garden crops on light soil. Fruit will be only an average crop, owing to frost when in bloom. A smaller number than usual of young stock is on pasture, but they are in a thrifty condition.—S. J. D.

Marinette County.—Spring wheat, oats, barley and peas look fine at present. The cold weather at the start of these crops gave them a chance to root well and now after the splendid rains of last week they are making a very good growth. The early planted potatoes are just coming up. The weather so far has been favorable for this crop, as the fields could be properly harrowed after planting, which helps very much to check the weed growth. For corn the weather has been rather cold, but it is now coming out nicely and some of it has been cultivated the first time this last week. Of the foregoing crops I think the usual amount of acreage has been planted, excepting possibly a few more acres of potatoes and spring wheat. Meadows look fine, especially new seedings of clover, which are excellent. Pastures have made a very good start last week. The prospect for fruit is good, trees having gone through the blossoming period without any damaging frost. The cherry trees are fine and well filled. The number of gardens is much larger than formerly. There is a great demand for cows. Pigs are very scarce and there are few on the market.—H. B. Pederson.

Outagamie County.—The principal crops are in good condition at the present time. Oats have improved and are making very satisfactory growth. Barley is doing very nicely at present. Rye has improved very much, but is thin in stand, due to late frosts and cold, wet weather. Winter wheat is improved and is doing very nicely since last report. Corn is somewhat backward, grub worms doing quite serious damage. About one-third replanted. The acreage of the principal crops, especially oats and corn, is quite above the normal of the last five years. Clovers, pastures and new seeding are splendid in this locality. Old meadows are not up to normal of other years. Fruits and garden truck are very backward at present, but may improve, as the weather looks favorable at present. Live stock is healthy. Some young stock was lost about six weeks ago with white scours.—Harry Leppla.

Ozaukee County.—On account of wet and cold season the crops are a little behind. Barley looks well, but oats does not, only half of it being up. Potatoes are fairly good, but corn is uncertain. Most farmers have to replant their corn. Hay is short and pasture is poor. Live stock is in fairly good condition.—Nic J. Mueller.

Price County.—Cold weather for the past two weeks has added but very little growth to our crops. Rye is short and starting to head. All small grains show good color, but rather short. Hay meadows show a prospect of a very short crop. They resemble city lawns and only three weeks to hay making time. All stock are improving as to condition, but if July and August should turn dry, stock will suffer from short meadows and lack of water. Corn is showing a good stand, but late. Potatoes don't show above the ground yet, except a few early ones. A few farmers are finishing planting late potatoes. Some have contracted their potatoes for $1 per bushel.—Wm. Fox.

Richland County.—Oats are looking fine. Wheat is winterkilled. Some pastures are getting quite good now, but were very slow on account of cold and wet weather. Prospects for hay are good. Gardens have been very slow on account of the cold. Corn is quite small yet, most of it about four inches high. It needs lots of warm weather to make a crop. Live stock is looking fine.—E. C. Stewart.

Sauk County.—Wheat and rye will be very short in the straw. Oats and barley are still backward, but are gaining. Corn is from two to four weeks backward. Many farmers had to replant whole fields. The hay crop looks best of any so far, but rain is needed. Pastures look normal. Apple and cherry trees give promise of bearing heavily. Weather is too cold for strawberries. Early potatoes show up nicely.—R. F. Klemm.

Sheboygan County.—Due to a long cold and wet spell the early part of June, almost all crops are two or three weeks behind. Spring grains have made slow growth; so have potatoes. Some farmers still have to plant their potatoes. Considerable corn remains to be planted. Some have worked up corn land and replanted it twice, due to heavy rains. Pastures have not kept cows up to normal milk flow. Most farmers had neither hay nor silage left on June 1st, and the poor pasture did not furnish enough feed for maximum production.—M. J. Hoppert.

Taylor County.—Weather cool and dry. There was a light frost on the 15th. Crops of all kinds are late and not doing very well. Old meadows need rain and warm weather badly. Corn is about all planted, but very little up yet. Potatoes look well. Garden truck is doing fairly well. Dairy products are on the increase. Young stock is doing well. Some new ground is being plowed and planted.—John E. Miller.

MINNESOTA.

Goodhue County.—The following is a brief outline of the crops covering a large part of Goodhue county. Conditions as compared with average crops: Winter wheat very good, but small acreage; spring wheat 60 per cent, average acreage; barley 90 per cent, average acreage; oats, medium to good, usual acreage; flax, fair, reduced acreage; corn, below average, increased acreage; rye medium, reduced acreage; hay (grass) light; hay (clover) very heavy, increased acreage; potatoes not far enough to make estimate; pasture medium. Fruit and garden truck promising. Young stock is perhaps 75 per cent in number with normal years, and owing to scarcity of feed last winter is in decidedly inferior condition. Hogs about 50 per cent in number, condition good. Chickens 75 per cent in number, condition good. Crops, especially corn, are not tilled as well as in normal years, owing to scarcity of labor. The labor offered in many cases is high priced, but very poor quality.—Otto W. Kolshorn.

About Selling Off Your Poultry.

To the Editor:—Because it is possible to start up in poultry in a comparatively short time, a large per cent of people, even farm people, are selling off the greater part of their flocks to save a few bushels of high-priced grain. Now, friends, think twice before you call a buyer. Consider this all-important part first: Next spring, when you expect to buy baby chicks, or even eggs for hatching, you will find that you are not the only one who is short on poultry products, and, ten to one, you cannot find what you need when you need it.

We are practical farm poultry people at this place, and we are not selling nor culling quite so close as formerly. Nothing that will not pay for its keep and a margin of profit is being kept, but anything in the hen or pullet line that will be a producer is held. Everything considered, poultry products are on par with other things, even grain at present high prices. It is all on an enormous scale and all there is for it is to produce enough high-priced stuff to sell to even things up. Within the next seven months a fairly good hen will pay for herself twice over and be worth as much money as before.

If it does not seem advisable to feed for eggs through the winter, hens may be kept at a small cost and be healthy and ready for business the latter part of February or the first of March, when they should lay almost continuously until molting time; and, unless there is a panic, eggs will not be cheap at any time this summer.

Keep your layers; the more the better, and divide the grain ration into smaller parts. Too much corn fed to farm poultry is largely the cause of liver trouble and kindred ailments. Farmers of the corn belt are prodigal of their corn. It is so plentiful, and has been at a moderate price so long, that it is hardly counted as being necessary to save. Give more bulky food. Bran, clover, alfalfa, some oats, possibly a little wheat—not much, some little corn and an abundance of milk, all the water they can consume, shells, grit and fresh air.

Minnie G. Stearns.

The Janesville fair will be held this year August 14th, 15th, 16th and 17th, being one of the early fairs in Wisconsin. There will be a good live stock show. Mr. John E. Kennedy, head of the Rock County Short-horn Breeders' Association, has secured the assistance of the national association, which appropriates $200 to be used in prize money. There will be a total of $500 in premiums for Short-horn classes alone at the Janesville fair. Special attention will also be given to the swine, sheep and horse exhibits and there will be an automobile show. One feature of the fair this year is that no complimentary tickets will be issued with the exception of one single admission ticket to each member of the fair association. The directors are expecting to pull the Janesville fair out of debt and have the best fair in the history of the association.

POULTRY AND PET STOCK.

FOR SALE---S. C. RHODE ISLAND REDS

GOOD BREEDERS from exhibition and trapnested laying stock. Write for prices. **WINNEBAGO POULTRY YARDS, A. J. Schloerb, Mgr., R. 23, Omro, Wis.**

BARRED PLYMOUTH ROCKS and Buff Orpington ducks. Chicago winners; great layers, established 1892. eggs for hatching: $1.00, 15, $4.50, 50; $8, 100, prepaid delivery and good hatch guaranteed. C. Earl Hoover, R. 24, Mathews, Ind.

HATCHING EGGS; prize-winning S. C. Reds, White Wyandottes, Buff Orpingtons, S. C. White and Brown Leghorns, $1.50 per 15. Ledge View Poultry Farms, Box W. F., Fond du Lac, Wis.

WRITE for low price on best thoroughbred poultry and pigeons, eggs and baby chix, ducks, incubators and brooders. Address Iowa Poultry Farms, Inc., Box 414, Clarion, Iowa.

HATCHING EGGS—S. C. Reds, prize-winners all leading shows. Eggs, $1.50, 15, $8, 100. Order from this ad. Address C. L. Pro Fontaine, Box 600, Fond du Lac, Wisconsin.

RHODE ISLAND REDS—Setting of 15 eggs from pure-bred, prize-winning Rhode Island Reds, $2 per setting, three settings for $5. Hildebrandt & Vea, Stoughton, Wis.

FARMERS' MARKET

WANTED — FOR SALE — TO EXCHANGE

THIS department is to bring the buyer and the seller together. You may have live stock, poultry and eggs or machinery for sale. You may want to sell or buy a farm. Write your copy for the advertisement. The rate is six cents per word, each insertion.

THE WISCONSIN FARMER - MADISON, WIS.

FARM LANDS.

NORTH DAKOTA, most successful agricultural state in the Union, producing as many dollars per acre as states where land sells four times as high. In past five years held first place every time in production of wheat and flax; and once in barley. In climate, soil, crops, railroads, schools, roads, North Dakota exactly as good as best in Illinois, Iowa or Minnesota. You can obtain a home there without commission to us, while land is still cheap. Easy terms. Write at once for plan direct dealing. J. S. MURPHY, Immigration Agent, Soo Line Railway, 1272 Soo Bldg., Minneapolis, Minn.

SILENT PARTNER WANTED—We have a fine chance to buy fine farms close to the city of Oconto, Wis., suitable for stock farms, that would feed over a thousand head of cattle, at a very low price on account of old age and death of owners. There are over 100 head of thoroughbreds on them now that would go with the farm. There is big money for the party that would furnish the money to swing the deal. Address C. S. Hart, Oconto, Wisconsin.

DON'T SAY FATHER HAD BETTER OPPORTUNITIES. Here is 120 acres very easily cleared land. Productive soil. Some rolling but all can be tilled; 5¼ miles to town, 2½ miles to creamery and store. Price from owner, $21.25 per acre. About $500 cash, balance easy terms, 6% interest. Famous Polk Co., 56 miles from St. Paul. Better see it. A. B. Wesner, Centuria, Wis.

RUSK AND SAWYER COUNTIES—We own 20,000 acres of good land and four townsites on the Soo and Omaha lines. Forties, eighties, etc. $15 to $25 per acre on very easy terms. All high land, plenty of hardwood timber and best clay loam soil. Excellent openings for saw mills and wood-working factories. Write for literature. Upper Wisconsin Land Co., Ladysmith, Wis.

NO PAYMENTS FOR FIVE YEARS—Only taxes and interest; $1.00 per acre down, balance on or before ten years; hardwood timber land with timber enough to pay for the land, close to market, schools and cheese factories; clay loam soil, all tillable. Taylor county, the clover and dairy belt of Wisconsin. Rib River Land Co., Medford, Wis.

$1,000 DOWN—Fine improved 80, only 1½ mile good town, 45 acres splendid field, 15 cleared, balance heavy hardwood. Level, with nice drainage. No rock. Buildings, well, etc. A big snap at $5,000. Come at once. Baker, D.110, St. Croix Falls, Wis.

IS YOUR CASH LIMITED? $300 down takes 29 acres, house 14x26, some cleared, level surface, good soil, no rocks, few stumps and a large piece nearly cleared. Overlooks big lake, handy creamery, school and town. Baker, H-110, St. Croix Falls, Wis.

668-ACRE IMPROVED STOCK FARM, Polk Co., Wis.; good buildings, fences, living water; small payments, easy terms, low interest. Write for description. Mason Booth, owner, Merchants' Hotel, St. Paul, Minn.

MARATHON COUNTY, WISCONSIN, improved farms $25.00 per acre and up; unimproved farms $15.00 per acre and up. Free list and map. Wm. Albrecht, Jr., Wausau, Wis.

BUSINESS CHANCES.

FREE for six months—My special offer to introduce my magazine, "Investing for Profit." It is worth $10 a copy to anyone who has not acquired sufficient money to provide necessities and comforts for self and loved ones. It shows how to become richer, quickly and honestly. Investing for Profits is the only progressive financial journal and has the largest circulation in America. It shows how $100 grows to $2,200; write now and I'll send it six months free. H. L. Barber, 509-28 W. Jackson Boulevard, Chicago.

MONEY TO LOAN.

MONEY to loan on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage. 6% with privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

FARM LOANS on very good farms at 5% interest without commission and with privilege of partial payments. Write Geo. L. Jacques, Special Loan Agent, Northwestern Mutual Life Insurance Company, Neillsville, Wisconsin.

REGISTERED HOLSTEIN BULL.

REGISTERED HOLSTEIN BULL ready for service; 2 of his dams averaged 100 lbs. milk in 1 day and 35 lbs. butter in 7 days, officially; $100. Wisconsin Live Stock Association, Appleton, Wis.

COWS FOR SALE.

I HAVE FOR SALE a large assortment of choice tubercular tested cows, all due to freshen soon. You can buy one or a carload. John Blanchard, Columbus, Wis.

HELP WANTED.

WANTED—Good experienced man for general farm work on beef cattle farm. No milking. Must be good with horses. State experience and wages in first letter. Ernest Biddick, Livingston, Wis.

RAILWAY MAIL CLERKS.

RAILWAY MAIL CLERKS WANTED—$75 month. Special examinations. Franklin Institute, Dept. D176, Rochester, N. Y.

TELEGRAPHY.

LEARN TELEGRAPHY—Positions guaranteed. Northwestern Telegraph School, Eau Claire, Wis.

SAVE MONEY ON LUMBER.

SAVE money on your lumber bill. Write us. Pacific Coast Sawmill Co., Portland, Oregon

FARM MECHANICS

Questions and Answers.

Melting Points.

What are the melting points of brass, copper, iron, aluminum and glass?

Answer.—Brass is an alloy, its melting point depending upon the relative amounts of copper and zinc used in its composition. One thousand seven hundred degrees Fahrenheit is a fair average. Cast iron melts at about 2,000 degrees, copper at 1,950 degrees, aluminum at 1,160 degrees and glass at 1,200 degrees.

The Best Type of Engine.

We want to get a twelve-horse-power engine. Which do you consider the better for all around farm use, the two cycle or the four-cycle engine? Which is the more economical in the use of fuel, the throttle governed, or the hit-and-miss type?

Answer.—The general opinion of designers is that throttle-governed four-cycle engines are better in fuel economy and reliability than the other types of engine. It is largely a question of design. There are some good two-cycle engines on the market, and a large majority of farm engines are of the hit-and-miss type. For furnishing electric power, the throttle-governed engine is to be preferred.

Lighting With Dry Cells.

I would like to know how many dry cells it would take to operate two six-volt, twelve-candle-power lights. How long would they last? I would like to equip my Ford car with electric lights, and I don't like to use the magneto.

Answer.—It is not practical to operate the head lights of an auto with dry cells, on account of the cost. To some extent, dry cells are being used to operate the tail light, where the candle power is quite small. To operate the two lights mentioned above, not less than sixty cells should be used—eighty would be better, connected in series-multiple, five in a series. About forty hours' service could be expected from the sixty cells.

Running Corn Sheller by Auto Engine.

I have a two-cylinder, twenty-horse-power engine. I would like to know whether it will run a four-hole Joliet corn sheller successfully if it is fitted with a throttle governor. What size pulley would be needed on the transmission shaft if the pulley on the sheller is seven inches diameter?

Answer.—Your engine has ample power to operate the sheller. Run the engine at about 700 R. P. M. To find the diameter of the pulley to use on the transmission shaft, multiply the R. P. M. of the belt pulley shaft of the sheller by 7, and divide by the R. P. M. of the transmission shaft of the engine. If this figures out a pulley less than six inches in diameter for the engine, it would be better to use a pulley larger than seven inches in diameter on the sheller.

Running a Washer With a Ford Car.

I have a 1916 Ford. Is it safe to put an eight-inch pulley on one rear wheel, jack up the wheel, and run a power washer from the pulley? What horse power would this develop, the engine running at a rate of twenty miles per hour on the road? Would it be advisable to occasionally change the pulley from one wheel to the other for light work? If so, how often? Should I take the pulley off and put the hub cap on to go on the road? How could I attach a ten-gallon cream can to the radiator to help cool the engine?

Answer.—It would be entirely safe to run the washer as you suggest. A washer requires very little power, usually less than one-half horse power, and, therefore, but little strain would be put on the differential gears. As much as twelve horse power could be delivered by the above method, but the differential would not stand up long under so great a load. It would not be necessary to change the pulley from one wheel to the other unless the axle bearing next to the wheel begins to show signs of wear. It would be best to remove the pulley when the car is taken on the road, as the pulley might catch on something that would bend the rear axle. You should have no trouble with cooling if your fan belt is tight, your spark properly advanced and your cylinders reasonably free from carbon. It would be possible to attach the cream can to the radiator by means of T connections replacing the top and bottom connections of the radiator. The T's would have to be made special, and a pattern and casting would be required. The upper T would be connected to the top of the can and the lower T to the bottom of the can, the top of which should be level with the top of the radiator.

Engine Does Not Run Steady.

I am writing to you about my gasoline engine, which does not run as it should. It starts easy and runs all right for a little while until it gets warmed up; and then every little while it slows down like it was going to stop, and then will start up again and run all right for a while. I have tested the batteries and the igniter, and the spark seems to be all right. I have ground the valves and cleaned the engine and carburetor. I am at a loss as to what is the trouble.

Answer.—The most probable cause of the trouble is too much oil working past the rings into the cylinder, causing poor ignition. This might be due to an oversupply of oil, a small piston or worn piston rings. A sticking float valve in the carburetor or a loose wiring connection could cause the trouble.

Making a Forge.

Please publish a sketch showing how to make a forge. I would like to have the blower run by a crank. I have a frame that has four legs. It is about three and one-half feet high. I can make the fire box part, but do not know how to make the blower.

Answer.—Figure 1 shows a sectional view of the forge; also the location and arrangement of the blower. An old iron tub may be used for the fire box. It may be mounted on a wooden framework. A hole should be cut in the bottom for a clean-out, and covered with a swinging plate, shown at

O in Figure 1. Another hole must be cut in the side for the air pipe. Fill the tub within four inches of the top with ordinary clay, leaving a hole about three inches in diameter through the middle. Over this hole, place the tuyere or grate, at the bottom of a bowl-shaped basin in the clay. This basin should be about five inches deep. A hood and smoke pipe S should be placed over the tub to carry away the smoke. H is a piece of sheet metal surrounding the back half of the forge. It prevents some of the smoke from escaping and helps to retain the heat.

The blower may be mounted near the ceiling, as shown, supported on two 2x4's. It consists of a top and bottom board, each shaped like Figure 3, except that the bottom board has the "handle" cut off. The radius of the circular part should be about fifteen inches. The top and bottom boards are connected by the leather bellows, B. H is a hinge, which may be made of leather. A hole three inches in diameter is cut in the bottom board, and covered by the valve, B, which consists of a piece of leather, fastened at one end and having a wood block on top of it. The blower may be operated by the pitman, P, driven by the crank, H. The arrangement of the crank is shown in Figure 2. Wooden bearings may be used for the crankshaft if desired.

Moth Balls in Kerosene.

I have been of the impression that if moth balls were put in kerosene and the feed pipe run along the motor in such a manner that it would get very hot while on the way to the carburetor, the motor would run on the kerosene after having been warmed up with gasoline. What is your opinion?

Answer.—We have never seen the moth ball idea tried out with kerosene. To use kerosene successfully, the kerosene should be heated, preferably by running the feed pipe through the jacket water near the carburetor, which should have a float chamber holding but little fuel. The air should also be heated. The fuel pipe should not be run through the exhaust, as too high a heat will carbonize the kerosene.

Some Tractor Engine Questions.

Please tell me whether an engine having a five-inch bore and six-inch stroke, running at 700 revolutions per minute and geared to two and one-fourth miles per hour, would be large enough to pull three fourteen-inch plows under average conditions? Are the Kingston and Swiss magnetos good for tractor work? Would it require as large a crankshaft for a five-bearing engine as for an engine having three bearings? Is one and seven-eighths inch large enough for the above engine if it has five bearings?

Answer.—You did not state whether the engine has two or four cylinders, but we presume that it has four cylinders, as you speak of its having five bearings. It should have plenty of power to pull three fourteen-inch plows under almost any condition. A two-cylinder engine of the above size would pull three plows under ordinary conditions. Either magneto should give satisfactory service. We would consider the above size bearing rather small for a five-inch cylinder, especially for tractor work. Much depends upon the quality of steel used in the shaft, however.

Horn and Dimmers.

I enclose picture of a Monarch exhaust horn. The law reads: "The use of siren horns except on motor vehicles in charge of the police and fire departments of cities and upon hospital ambulances and fire insurance patrols is hereby prohibited." Is the horn referred to considered a siren horn? Does a Model 1915 Ford car require a dimmer on the lights? The city law here requires the lights to be dimmed on the city streets. How could you wire for a dimmer to be controlled from the driver's seat?

Answer.—The term "siren" is rightfully applied only to horns which produce a sound gradually and alternately varying between high and low pitch. As the horn you refer to produces a musical chord, the pitch of which does not vary, it should not be classed as a siren horn. The dimmer ordinances of nearly all cities may be satisfied by painting the upper half of the light glass with whiting mixed with water or gasoline. This may be easily removed if desired. If the Ford is not operated at high engine speed, the dimming feature should not be required. A set of dimmer lights could be installed in exactly the same manner as your other lights and operated by a separate switch. It would be better, however to operate both sets of lights from a four-point switch. Consult your dealer in auto supplies.

WHEN men are drawn together in the army, you find out a lot about their likes and dislikes. It's always been a great place for the spread of W-B CUT popularity. They show each other why you shouldn't take more than a *little* chew of W-B CUT. Every shred is chock full of sap; a big chew is too rich. They take to W-B CUT, strong; nothing is too good for our soldiers.

Made by WEYMAN-BRUTON COMPANY, 1107 Broadway, New York City

Get My New Patriotic Prices!

On Spreaders — Tractors — Engines — Separators

Find out and satisfy yourself how much you can save by getting your farm implements direct from Galloway—the maker. This direct dealing is actually buying at wholesale, and even less, and saves you 25% to 50% on everything you need on the farm —Spreaders, Tractors, Engines, Separators, Wagons, Implements, Vehicles. I'll tell you why you can save by direct buying in my big, free book. I'll also tell you where the extra money goes—the money you save by dealing direct with the manufacturer.

Write for My Free Book That Keeps the Prices Down

It's the greatest bargain book ever published, and will save my farmer friends thousands and thousands of dollars. Write me for the book today. A postal will do. Let this book be your buying guide and save you $200 to $500 on your summer purchases. Don't hesitate. Dont put it off — but send tonight for my big money-saving book. Advantageous shipping points save you freight.

WM. GALLOWAY, Pres., WM. GALLOWAY CO., 37 GALLOWAY STATION, WATERLOO, IOWA

Live Stock and Commercial Notes.

Gathered by Representatives of The Wisconsin Farmer.

What Is Doing at L. F. Atwater's.

WE recently spent the day with L. F. Atwater, Bangor, Wis., and no doubt many of our readers would be glad to know what is going on at their great Duroc establishment. About 125 pigs represent the pig crop and L. F. thinks they are better than they were at this time last year. Rising Star 2d, a full sister to the last year's grand champion sow, has a fine litter of ten sired by P. S. Wonder. Lee's Girl, the dam of the boar purchased by Church, of Elkhorn, in the sale last fall, has one of the best litters on the farm sired by Proud Chief Jr. Four of this litter are entered in the futurity. Marion 3d, whose five daughters sold in the winter sale at an average of $105, has a litter of ten by Illustrator King. Marion's Lady, the best sow in the herd, farrowed her seventh litter this spring, and will be shown this fall as the aged sow. The first five litters from this sow have averaged over $600 per litter, and he is keeping the sows out of the last two litters. Model May by King the Col., and the dam of Model King, has six dandies by P. S. Wonder. From this litter one boar and one sow will be shown. Defender Queen 2d, litter sister to the $410 sow, has a fine litter by Proud Chief Jr. Four of these pigs are the best on the farm and can be seen at Milwaukee. The junior champion sow of Minnesota and Wisconsin, raised nine good pigs by P. S. Wonder. The high Model sow, the top of the Shanks sale, farrowed eight pigs and raised five. Of this number the two boars are choice. This litter is by Investor. The top gilt of the same sale is raising six young Investors. Atwater has his pigs sorted into five bunches, and they certainly are doing well. He will have a great bunch for his boar sale October 17th. As to his show herd, they are better at this time than they were last year. We feel safe in saying that this breeder will have the largest under-year boar out this fall. The writer weighed this boar at nine months and 11 days old, and he weighed 453 pounds, and he isn't in show condition yet. This is the Orion Cherry King boar bought in Ohio. The following are the weights of the show herd on June 12th. The junior yearling sow, 537 pounds; the senior yearling sow, 610 pounds; the aged sow, 725 pounds, and three under-year sows averaged 360 pounds. The futurity pigs weighed from 85 to 104 pounds. The breeders that bought sows bred to Proud Chief Jr. and P. S. Wonder will have reason to feel proud after the ribbons are tied this fall on the get of these boars.—Adv.

J. E. Kennedy Adds 13 More Short-horns at an Average of $1,207.

THOSE in a position to know have made the remark that J. E. Kennedy, Janesville, Wis., now has the best herd of Scotch Short-horn cattle in Wisconsin, and that it would be impossible to pick 50 breeding cows in one herd in America better than those that now grace Oaklawn Farm at Janesville. Those who have been following the Short-horn sales during the past year are familiar with the class of cattle Mr. Kennedy has been buying. During the week of June 4th, 12 females and one bull were added to this herd at an average cost of $1,207. In the Carpenter & Ross sale he bough Imp. Kirklevington Empress 12th, a fine white cow with a heifer calf at foot. She cost $1,200. In the same sale he bought an imported heifer at $1,000. In the Frank R. Edwards sale five head were purchased by Mr. Kennedy at prices ranging from $775 to $1,300. In the Thos. Stanton sale six head were bought for Oakland Farm, among them being Maxwalton Amateur, purported to be one of the great Short-horn bulls that has gone through a sale ring the past year. Maxwalton Amateur is a three-year-old roan bull sired by the noted Maxwalton Renown, he by the one and only Avondale. His dam is a straight Bruce Augusta, perhaps the most popular family known to the Short-horn breed. Mr. Frank Harding made the statement that he considered the dam of this bull the greatest Short-horn cow he ever saw. This bull cost Mr. Kennedy $3,450 and will be assisted in the herd by a son of the 1909 International champion, Selection, for which Mr. Kennedy paid $2,000 as a calf. This recent purchase gives the owner 50 head of breeding cows that for individuality and breeding are the equal of any in the United States. We will have more to say about the cows in this herd later, but for future reference bear in mind that Oaklawn Farm, Janesville, Wis., is the home of one of the great Short-horn herds. It is worth traveling many miles to see.—Adv.

W. W. Quackenbush, Melrose.

THOSE that attended the Madison Poland China sale last winter will remember that W. W. Quackenbush, Melrose, Wis., bought five of the best sows that were consigned to that sale. We recently saw this herd, and this breeder has Polands that will compare with any in the state. Besides the sows purchased at Madison, he bought several other high-class sows during the past winter and at this time he has some 75 spring pigs on the place. A little later we will tell you of the blood lines represented in this herd. Mr. Quackenbush is a good feeder and will have some fine boars and gilts to offer.—Adv.

Bernd Short-horns.

DON'T forget W. J. Bernd, New Richmond, Wis., if you are in the market for a Short-horn bull or in fact anything in the line of Short-horns. This firm has a large herd of good cattle and they can supply your wants and make you satisfied. If interested write them and mention The Wisconsin Farmer.—Adv.

McDonald's Show Herd Doing Fine.

WE recently spent a day with J. D. McDonald, of North Bend, Wis., and the Poland Chinas he is fitting will make some sit up and take notice again this fall. As is the case with every breeder that has a winning herd of cattle, horses or hogs, someone will complain about the winner getting ribbons "handed" to him or having the judge "fixed" and, of course, we have heard these remarks made about J. D. McDonald because he has a herd that can win, but if some of these same men would put in the time and care with their show material that Mack does they might be able to win too. Mr. McDonald is in the game to win and if there is anything that he can do or buy that will make his hogs better, a few dollars will not stop him. At this time none of the stuff is carrying too much fat to be past the "blooming" stage by fair time. Oakwood's Big Model, the senior yearling boar, weighed 575 pounds June 1st. The following weights were taken Decoration Day. The junior yearling boar, Oakwood's Giant, weighed 520 pounds. The three under-year boars averaged 390 pounds. The same aged sows will be shown that won last year. Mack has a choice senior yearling sow sired by Jim Crow, the sire of last year's winners. She weighed 590 pounds. At this time the best sow on the place is the junior yearling. She is almost perfect and weighed 545 pounds. She is sired by Hancher's Big Price. The futurity pigs weigh right at 100 pounds now. Miss Chief Price, the Minnesota grand champion, has seven fine pigs by Crow's Progress. Miss Price 4th has seven by Matchless Wonder. The real boar on this farm is Mc's Big Bone, a senior yearling by Big Bone's Equal out of a Black Orphan dam. This is the best boar we have seen on the McDonald farm and he would make a creditable showing, but Mack does not know whether he will take him out or not, for he will be more valuable as a sire than a show boar. There are 160 pigs on the farm, and they have done fine. If you want good Polands you can get them in this herd.—Adv.

Queen Viola, the $1,000 Chester White Sow.

WE recently had a visit with A. C. Brecher, Alta, Iowa, the man that had nerve enough to pay $1,000 for Queen Viola, the Chester White sow that was grand champion at the National Swine Show. This sow farrowed 19 pigs and raised 13, five boars and eight sows. He has sold four of the boars for $750 and kept one for his own use. He has had a chance to sell all of the eight sows, but they are being retained for the sow sale that will be held next winter. Even though this sow cost $1,000 one can see that this investment will prove profitable and it has put Mr. Brecher on the map. Before he bought this sow he was unknown as a Chester White breeder. Now every man that has Chesters has heard about Brecher. Besides owning the world's champion Chester White sow, the buy was worth $1,000 to Mr. Brecher in advertising.—Adv.

Red Polls from A. R. Dams.

L. C. UNDERWOOD, Avoca, Wis., is now ready to ship you a Red Poll bull. This is one of the good Red Poll herds in the state and those that favor this breed will not be disappointed with the Underwood cattle. The cows in this herd are producers. One cow in the herd that has been milking since last November gave 51 pounds of butter fat and 1,370 pounds of milk during the month of May. Five of the 10 cows in milk gave over 40 pounds of butter fat during May. This was under ordinary farm conditions. Mr. Underwood is a good feeder and caretaker and his Red Polls are in nice condition ready to go on and make good for the buyer. This breeder is the secretary of the state association, and if there is any information relative to the Red Poll breed that you would like to have, write him. Mention this paper, please.—Adv.

Duroc Specials.

JUST at this time Geo. D. Sprain & Sons, West Salem, Wis., have some special bargains in Duroc Jersey pigs. If you will buy a pair or a trio they make prices that are attractive. Their spring pigs are sired by several good boars. There are three good boars doing service in this herd. Grand Model 21st is a boar of great length and size, and is sired by the triple grand champion, Grand Model. Royal Top Col. was a winner last year, and is sired by Put's Top Col. by Morton's Top Col. Illustrator Special is the best boar on the farm just at this time. He is sired by the grand champion, Prince Illustrator, out of a King the Col. dam. Besides pigs by the above boars they have pigs out of good sows that they bought last winter. The Sprain Durocs are good enough to ship on approval. Let them quote you prices.—Adv.

Durocs—Last Chance.

C. J. DAMEROW, Beloit, Wis., has some Duroc Jerseys to sell that are bargains. They were farrowed last fall, are well grown and good individuals. The gilts have been bred to farrow this fall, and the boars are good enough to head a good herd. For quick sale, Mr. Damerow is pricing this stuff very reasonable, and if you are interested get busy at once. The fact that this breeder offers to ship on approval is a recommendation for his Durocs.—Adv.

Great Galloway Bargains.

IF any reader of this paper wants to buy some good Galloway cattle he should write to or go and see C. S. Hechtner, Chariton, Iowa, at once. He is offering 50 head of his very best cows for sale, and among these are some of his best show cows. These are all bred and well along in calf. He is offering these cows at prices at which any farmer or breeder can afford to buy and make all kinds of money on them. He also offers 16 head of good, serviceable yearling bulls for sale and quite a few of these are out of imported cows. We certainly think he is offering you some great bargains in Galloway cattle, and at prices that will astonish you when you think of what some cattle are selling for at the present time. We suggest that you get busy right away and go and see these cattle, and when you write Mr. Hechtner kindly mention this paper. See advertisement on page 16.—Adv.

H. O. Tellier, Auctioneer.

DURING the next few months many sales will be held and other breeders will contemplate holding sales this coming fall and winter. For the benefit of those who may hold sales in the future, we wish to direct your attention to H. O. Tellier, Farmington, Minn. Mr. Tellier is a man with unlimited experience in connection with the pure-bred live stock business and is a salesman of unusual ability. He has a wide acquaintance among the breeders and he can get you the high dollar for your stock when sold at public auction. The fact that he is on the leading sales of the Northwest speaks for his ability. Write him for dates. We are glad to recommend him.—Adv.

Good Poland Buys.

IF you want Poland Chinas write L. E. Pease, Wales, Waukesha county, Wis. Mr. Pease has a nice lot of fall sows bred to farrow this fall, and they are being priced worth the money. They are bred to Model Giant, perhaps the best son of Master's Giant that ever came to Wisconsin. The spring pigs by this boar are fine, and if you want the pick, get your order in early. In writing, please mention The Wisconsin Farmer.—Adv.

SALE DATES.

Short-horn Cattle.

Oct. 31, Carpenter & Carpenter, Baraboo, Wis. (Sale at Chicago, Ill.)
Dec. 1, Anoka Farms, Waukesha, Wis.
Feb. 25-Mar. 1, Short-horn Congress Sale, Chicago, Ill.

THE MARKETS.

Union Stockyards, Chicago, Ill., June 23d.—The annual early summer readjustment of cattle values has been vigorously prosecuted during the past two weeks and while choice corn-fed beeves are holding strong and selling readily at the highest prices of the year, with a new top of $13.80 this week, declines have been shown from the high point on all steers going below $13 and practically everything in the butcher cattle line. Middle and low-grade cattle of both sexes, particularly anything showing grass, has dropped anywhere from 75c@$1.50 from the May high spot, when killers took anything wearing a hide without haggling. In the undercurrent of the market conditions are unstable. Too many light steers are being dumped into the hopper, and as country demand is lacking, they are being rough-handled. The future of such steers as are selling anywhere from $7.50@10.50 is in doubt. They have no regular standing at present, and prices depend largely on the mood of the buyer.

Hogs have had their June break, in the opinion of most people connected with the trade, and packers realize it. From the crest of the May rise to the bottom of the break the depreciation was about $1 per cwt. of which 25@50c has been recovered on qualitied kinds. Packers have been disappointed in the June run, both as concerns numbers and quality. Good hogs have been closely garnered, few growers overstaying the high markets, and the next 90 days will witness a run of mediocrity and trash. Packers are buying common hogs because the other kind is available only in limited numbers. The July run will be freighted with packing sows and the majority of them will not be overburdened with lard. A wide spread between good shipping grades and packing stuff is inevitable, but backers have abandoned the idea that they will have access to cheap hogs.

That the 1917 lamb crop all over the United States is the smallest in 25 years is now definitely known. Two weeks ago killers made a successful raid on sheep values with the avowed intention of putting the common price of spring lambs down to $15 per cwt., but for days past they have been losing ground, the market having reacted $2.25@2.50 per cwt. Spring lambs sold at $19 per cwt. on the local market yesterday, and the prospect for an $18 market all through the summer is excellent.

New high records are being scored in the wool market. In Montana a good combing clip changed hands at 57c. Ohio growers are said to be demanding from 65@70c for both fine and medium clips and some eastern buyers are operating freely at 65c. A year ago one-fourth blood combing Ohio wools were quoted from 37@38c and on March 1st of this year 52@55c, which shows the rapid upward strides made in values with the end not yet in sight.

The break in cattle values late last week and early this week has arrested loading of light cattle in the country, as it should. At the new scale of prices there is no longer incentive to gather them. If the country holds back light stuff next week the market will have a chance to recuperate. The beef market down east is not as healthy as it might be, but will respond to diminished supply, as local stocks are not heavy and are easily depleted. The better grades of beef steers, the $12@13.80 kinds are no lower than last week's close. In the lower levels of the market trade is hard to quote. It has been a matter of doing the best they could with bids frequently 50c apart. With a glut of common steers everywhere killers have been under no necessity to buy that kind, and little country competition has been available.

Butcher and canning cattle have suffered sharp declines again this week on all but prime corn feds which are very little lower than the best time this season. Canners and cutters are $1@1.25 per cwt. under the high spot in the trade, medium to good beef cows show 75c@$1 decline, the choice grades of grass-fat cows, or the kinds selling from $9.50@10.25, have declined about 50c per cwt., while the in-between slippery kinds of heifers that during the booming market sold all the way from $9@10.50 per cwt. are off $1.50. Bulls have suffered a similar decline to she stuff with the exception of choice butcher bulls, and even they show 50c decline, while everything else is $1@1.50 per cwt. under the high time. Everybody expected this break in the market, for it always takes place when the grass cattle begin coming, and with cattle values on such an abnormally high basis, as they have been all spring, it was only logical that the decline should be not only sudden, but very severe, and from now on until midsummer some rather violent fluctuations in the butcher stuff trade are probable, yet for the time being it would seem as if enough decline had taken place and between now and the fourth of July lessened receipts and some recovery in prices is likely. Veal calves are selling very high in sympathy with the lofty lamb market, as high as $15.85 (a record price) having been paid for prime vealers the last few days and the bulk of the crop at $15@15.50.

Little interest is being taken in she stock cattle at this juncture, especially in the corn belt. Prices have been high and the producer is more interested in feed than feeding. Grass may be plentiful, but corn is scarce and there is a general disposition to reduce summer beef-making operations to minimum volume. The country has been wary of investment at the prices and is in waiting mood. Most grades of stock and feeding cattle are 50@75c lower than a week ago, while compared with the recent high spot plenty of common light stockers of both sexes are a flat dollar lower. A spread of from $8@8.85 is taking the bulk of the fair to good stock and feeding steers, with choice to extra feeding yearlings and best fleshy feeders making $9.50@10.

Continued fine weather in most sections has held hog receipts to proportions well within the requirements of the trade. Demand in fact exceeded supply during the fore part of this week and prices at the close Wednesday stood 40@50c above the corresponding day last week. On Thursday receipts expanded somewhat and the market lost a little of its gimp, most sales being 10@15c lower after the start when some choice heavyweights landed about steady. Further depreciation, particularly on packing and common light stuff, occurred on Friday when comparatively few hogs were good enough to sell at $16 or better, while some thin, light weights sold down below the $15 notch, but the bulk of the packing and butcher hogs sold within a range of from $15.15@15.80, the general average at $15.48 comparing with $15.50 a week ago. Pigs are selling largely at $13@14.50 for good to choice.

Receipts of sheep and lambs have been light again this week, the marketing for the past fortnight having been the smallest within any corresponding period within a generation. Demand has not been met and the market has advanced sharply, showing at the close price jumps of from mostly $1@1.25 on choice lambs over a week ago and gains of $2.25@2.50 per cwt. over the low spot two weeks back. Matured muttons of fat class have advanced $1@1.50 within this period. Over one-half of the week's receipts have been direct to packers, from Ohio river markets, the movement of Tennessee and Kentucky lambs now being well under headway. The market occupies a somewhat treacherous position and it will take no marked swelling of supply at this juncture to cause an abrupt decline. Nothing cheap, however, is possible, as western lambs will be late and below normal in quantity and native territory cannot furnish enough to give the buying side a material advantage. As the season ages inquiry is increasing for feeding and breeding stock, but very little is coming to supply the wants of the trade in this line. Most of the right good to choice spring lambs are making $18@19 and grass-fed handyweight shorn lambs of medium to best class are worth $15.75@16.75, a coarse, bucky, native sort with weight ranging down to $14. There is inquiry for smooth, light shorn lambs for feeding purposes up to $12.50@12.75. Fat ewe trade is on a $10@10.50 basis for natives with choice light fed westerns selling on up to $11. Light matured wethers are quotable to 12.50 and $13@13.50 is taking most of the yearling stuff coming, although choice, light, dry-fed yearling wethers are nominally quoted to $15 and higher. Native year-

ling ewes are going out for breeders up to $12 and better and a full-mouthed class sells around $10.50@11. A part deck of extra choice fed Idaho ewe lambs, averaging 102 pounds went to the country as breeders at a cost of $17.50 per head.

Central Wisconsin Holstein Breeders.

To the Editor:—On account of bad weather the summer meeting of the Central Wisconsin Holstein Breeders' Association at Marshfield, Wood county, was held in the large pavilion. It was a union meeting of all breed organizations. Geo. F. Coming, Eau Claire, and Charles H. Hill, of Rosendale, were the chief speakers. There was a splendid program of recitations, songs, games, etc. At the business meeting it was decided to hold a public sale again next fall. The following sales committee was chosen: W. W. Clark and O. J. Leu, of Grand Rapids; J. C. Kieffer, of Auburndale; Wm. Burhopp, Marshfield, and Wm. Krause, of Thorpe. We had a large crowd at our summer meeting. O. J. Leu, Sec.

Rural Letter Carriers Meeting.

The postponed annual convention of the Wisconsin Letter Carriers' Association will be held at Sturgeon Bay, July 4th and 5th. This is a meeting toward which the carriers have been looking with great interest and will probably be one of the best meetings they have ever held. A splendid program has been arranged.

Over $1,000 will be awarded in cash in premiums at the La Crosse Corn and Grain Show, at La Crosse, Wis., December 17th-22d. There will be entries from Wisconsin, Minnesota and northern Iowa. A tentative premium list sent out shows fourteen classifications on corn, besides three sweepstakes and liberal premiums for oats, barley, wheat, rye, buckwheat, sheaf grains, sheaf grasses, potatoes, soy beans, field peas, garden peas and beans. Our readers throughout western Wisconsin and eastern Minnesota should keep this La Crosse Corn and Grain Show in mind. It will be worth while to be an exhibitor and also attend the show.

Food Conservation in the Home.

(Continued from page 1.)

except that sterilization should continue for 20 minutes instead of 16.

Tomatoes are canned in a manner very similar to that used for hard fruits. The first step is to grade them for size, ripeness and color with the view of putting only those that are alike in the same jar. Next, scald in hot water long enough to loosen the skins and plunge quickly into cold water. A convenient way to do this is to place the fruit on a clean cloth and, by gathering up its four corners, dip fruit and all into the hot water for a few seconds and then into the cold. After this remove the skins and cores and pack in jars, using only whole tomatoes. Add one level teaspoonful of salt to each quart; place the rubber and cover in position and partly fasten; then sterilize for twenty-two minutes. When this is done, remove jars, tighten covers, invert and let stand a while to cool. If there are no leaks, wrap in paper and store.

Vegetables, such as lima beans, string beans, peas and okra, must be sterilized for a much longer time than fruits or tomatoes, since their tissues are thicker and they contain less acid, which serves to check the work of decay organisms. Canning should be done the same day the vegetables are picked. The first thing necessary is to cull, string or shell. Then blanch in hot water for from two to five minutes, remove and plunge quickly into cold water. Pack in jars or tin cans and add one level teaspoonful of salt to each quart and enough boiling hot water to fill the open spaces. Place rubbers and tops in position and partly fasten, or, if tin cans are used, cap and tip. Sterilize in the hot water bath for 120 minutes; then handle in the same way as fruit.

The foregoing process is also used for sweet corn, except that the time for blanching and sterilizing is longer. It is necessary to blanch the corn on the cob for from five to fifteen minutes before it is plunged into cold water. Then the corn is sliced off with a sharp knife and packed in jars. A teaspoonful of salt is added to each quart and enough hot water to fill all open spaces. The sterilization should continue for 180 minutes instead of 120, as in the case of other vegetables.

In all the canning operations mentioned, the length of time for sterilizing, or boiling, applies to quart jars and when half-gallon jars are used the time must be lengthened 10 or 15 per cent. For instance, if corn is packed in half-gallon jars, it must be sterilized for 200 minutes instead of 180, since the larger bulk requires more time for the heat to penetrate to the center of it. In every case care must be taken not to count the time for sterilization before the water has started to boil vigorously. Bubbles begin to rise before the water has actually reached the boiling point of 212 degrees and sterilization does not begin until a few minutes after this.

These are the directions for canning that have been used with success by canning clubs all over the country, and anyone who will follow them carefully can put up enough fruit and vegetables to provide a variety and abundance for home use, and possibly some for sale. Throughout the season there is bound to be a large supply of perishable produce without a market, and those who undertake to can it, so that it may be saved for later use, undoubtedly will be as true patriots as those who serve their country in producing grain or munitions of war.

Field Men for The Wisconsin Farmer.

J. R. Garver, eastern half of Wisconsin. Address Room 201, Washington Building, Madison, Wis.

T. P. Shreve, western half Wisconsin and eastern Minnesota. Address 115 S. Main St., Janesville, Wisconsin.

Purebred Registered
HOLSTEIN CATTLE

$53,200 PAID FOR HOLSTEIN BULL CALF. The greatest tribute to the superiority of Holstein-Friesian cattle was paid in the auction sale at Worcester, Mass., June 7th and 8th, where a Holstein bull calf brought $53,200, a Holstein cow $18,300, and a Holstein heifer $18,000; 143 animals were sold for $296,470, or an average of about $2,073 per head. In 1916 at Detroit, Mich., 140 animals were sold for an average of $1,173 per head. This great increase in selling values is proof conclusive of Holstein popularity, partly due to the Holsteins raising in the past year all world's 7-day records for milk and butter. The world's record for butter in 7 days is now over 50 lbs.

Send for FREE Illustrated Descriptive Booklet.
The Holstein-Friesian Association of America
F. HOUGHTON, Sec'y. Box 143, Brattleboro, Vt

RUST BROS.

OFFER the richly bred Holstein bull, Sir Ida Lotta Hengerveld 188663, born Aug. 18, 1915. Ready for service. His dam, Ida Lotta Hengerveld, at 3½ years made 21.34 lbs. of butter in 7 days, 31 days after calving. She is from a long line of heavy producing ancestors, records of her three nearest dams averaging 27.20 lbs. butter in 7 days. She has inherited this heavy producing ability, and transmits it. Sire of bull for sale is Daisy Johanna 5th, 1st prize two year old at Wisconsin State Fair, 1915. His dam has two A. R. O. daughters. Arthur Rust, West Allis, Wis.

WE OFFER NOW FOR SALE

DAUGHTERS of Sif Johanna De Colantha De Kol 53056. We have 4 heifers about 6 months old out of him for sale. Price $600. They are nicely marked, well grown and backed by A. R. O. records and rich breeding. We also have a few heifers bred to a 33.68-lb. bull for sale and also several cows bred to the same bull. Prices on application. Inspection invited.
B. F. WINCKLER & SONS **Medina, Wis.**

BUY HIM NOW

A Jan. 15, 1917, bull calf, evenly marked, tuberculin tested, and a good individual. Sire is a son of Pietertje Maid Ormsby 35.56 butter in 7 days, has full sister with record of 1,255.6 butter in 365 days, average per cent fat 3.95. Dam a 15 lb. 2-year-old granddaughter of King of the Pontiacs. For pedigree and picture write to Walcowis Farms, N. Dickinson & Son, Lake Geneva, Wis.

A 28.70-POUND HOLSTEIN BULL

WHOSE 2 NEAREST DAMS average 32.07 lbs. butter in 7 days. His sire is out of the 35.43-lb. cow, Pontiac De Nylander. His dam has a record of 28.70 and has a 24.61 lb. 4-year-old daughter. He is ⅞ white, well grown and of exceptionally good conformation. Send for his extended pedigree. Address
A. M. ANDERSON **WHITEWATER, WIS.**

HOLSTEIN BULL FOR SALE—Holstein bull, born Oct. 14, 1916. Good A. R. O. records on both sire's and dam's side. Nicely marked, about one half white, straight, good size, ready for light service. For pedigree and price apply to Mountain Ash Stock Farm, J. B. Cain, Proprietor, Glenbeulah, Wis.

HOLSTEIN CALVES

WE OFFER FOR SALE choice, beautifully marked, 15-16 pure-bred heifer or male calves 1 to 2 weeks old, out of high milking dams, $15 each, crated f. o. b. cars. First check takes them. Write **W. C. KENYON & SONS, ELGIN, ILL.**

VOL. XLVI. NO. 27. THURSDAY, JULY 5, 1917. WHOLE NO. 1849

Interest in Red Polled Cattle.

Dual-Purpose Type Should Prove Popular in Wisconsin, Where Both Milk Production and Beef are Desirable---By L. C. Underwood.

IT IS NOT the easiest thing in the world to trace back to the time when Red Polled cattle were first known. The fact is that time is now so far distant that it is much more simple to refer to the latter achievements of the breed than to try to give authentic information as to its ancient history. Red Polled cattle have been bred and improved in England for more than 150 years, and we have pretty accurate information and records concerning their development during that period. In the earlier days of the breed's history there were two counties in England, Suffolk and Norfolk, where the Red Polled cattle were made a specialty and where breeding for improvement resulted in a very splendid type which Red Polled breeders have since tried to copy and improve. In the absence of recorded facts concerning the earliest development of this breed in England, various theories have been set forth to account for the origin of what we refer to as the Suffolk and Norfolk Red Polled cattle.

However, in support of the assumption that there was of old a breed of Red Polled cattle, it may be mentioned that there is at the present time in a remote district of Austria a breed corresponding in every important particular to the purest and best type of Suffolk and Norfolk stock. The most conspicuous development of this breed, however, has come in the past decade in America, where results have been obtained beyond comparison with that of the famous English herds.

As an example of the Red Polled milk and butter fat production, I need only refer to such a herd as has been developed by the Jean Du Luth Farms, in Minnesota. On these farms they have a pure-bred Red Polled cow, Beauty 31725, which stands forth in competition with the big butter fat producers of the world. She has a record of 20,280 pounds of milk in one year, and 891.5 pounds of butter fat. Notwithstanding this splendid record, she came through the test with a weight of 1,750 pounds, indicating the superb character of the Red Polled breed in producing beef as well as milk. In this same herd, which is one of our best examples of what can be done with Red Polled cattle, there have been as high as thirty cows, with not a single one having an official butter fat record below 460 pounds. Thus it may well be assumed that the Red Polled cow, when properly bred and properly cared for, can do even better than the "pound-a-day" record, toward which all Wisconsin dairymen are striving as an average for their herds. It must be remembered in this connection that Wisconsin has too long worried along with 150-pound cows, and with a state average around that figure, Wisconsin cannot assume the place in the world of dairying to which she rightfully belongs. The effort therefor is for more uniform production, raising our herd and state averages, and I am convinced that the Red Polled cow may be depended upon to do her part in this effort. Wisconsin has at this time a number of very creditable herds of Red Polled cows, whose yearly butter fat production runs from 300 to 400 pounds. It would be possible for me to cite a number of individual records in this state running from 400 to 500 pounds of butter fat.

GOOD TYPES OF RED POLLS CARRY SHOW FLESHING QUALITIES AS WELL AS DAIRY CHARACTERISTICS.

Let us consider the beef-producing qualities as well as the milk giving qualities of the Red Polled breed. In England at the Smithfield Club show, in 1890, a Red Polled steer dressed 73.72 per cent. This, according to the London Live Stock Journal, has been exceeded only once in England and never by a pure-blooded steer of any breed. In the carcass classes at the International Live Stock Show, at Chicago in 1908, in the two-year-old class, with thirteen entries, all breeds competing, Red Polled cattle won third and fourth places. This, as beef breeders will readily recognize, was keen competition, and there were superb entries in the class from Iowa, Nebraska, Minnesota and Missouri state herds, and from the best individual breeders in the beef-raising section of our country. In 1909, with similar competition, Red Polled cattle won fifth in the two-year-old class. Again, in 1910, all breeds competing, and the best stuff of the country exhibited, Red Polled cattle won fourth place in the same class. In 1911, under similar conditions and in the same class, they won third place. Again, in 1912, they won third and fifth, first going to the University of Nebraska, and second to Iowa State College, Ames, Iowa. The

(Concluded on page 15.)

THE RED POLLED COW WILL BE AN IMPORTANT FACTOR IN THE FUTURE IN BEEF AND DAIRY CATTLE IMPROVEMENT. STYLE AND MASCULINITY MUST BE DOMINANT CHARACTERISTICS OF THE RED POLL SIRE.

FARM MECHANICS

Lubricating Exposed Gears.

The problem of lubricating the exposed gears of a tractor is a difficult one. The lubricant must not be thin enough to run off, and it must not be gummy enough to hold the dust and dirt. The following is recommended to be a very efficient method of lubricating exposed large cast iron gears, like the bull gear of a tractor.

Mix one pint of powdered rosin with one pint of graphite and one pint of gasoline. Apply this mixture like paint to the teeth of the gear and allow it to dry. This should not require over a half hour. Give the gear teeth a coat of the mixture every ten days, or as often as they show signs of needing lubrication.

Questions and Answers.

Were Old Motors Efficient?

Were the old style motors put in cars eight or ten years ago as efficient in operation as the late ones? I mean in power actually developed, not in operation on the road or in hill climbing?

Answer.—The principal improvement has been in the reduction of weight for a given horse power. The new motors are also more durable, due to better oiling systems and reduced weight of the reciprocating parts. It is doubtful if the motors of today show a greater fuel economy than those of several years ago. There has been some progress made in carburetor design, but this is offset by the poor fuel now on the market.

Brakes Will Not Hold.

I have a 1916 model Maxwell on which the brakes do not hold as well as they should. I have tightened both hand and foot brake turnbuckles until they are tight enough, but still it takes both brakes to hold on hills where formerly one would hold easily. The brake bands have had grease on them, but I have cleaned them off well. The brake band lining is not worn badly. Is there something I could put on them to make them hold better? I suppose a new lining would be better, but why will the old ones not hold until worn out, or nearly so?

Answer.—The material from which brake lining is made has a tendency to glaze. Soak the bands in gasoline to remove all the grease. Allow them to dry thoroughly, and then file the outside surface with a coarse file just enough to rough up the surface. If they still slip, you might use powdered rosin on them.

Carbon Removers—Aluminum Pistons.

Are any of the so-called carbon removers on the market harmful to the cylinder walls or pistons of an engine? What is the advantage, if any, of aluminum pistons in a Ford motor?

Answer.—We have heard of no bad results from the use of carbon removers. Aluminum pistons should increase the power of any engine. A considerable part of the power of an engine is used to move the piston and connecting rod back and forth. The lighter the piston and rod can be made, therefore, the more power the motor will develop. The bearings will also wear longer, as the piston and rod exert a pounding effect on the bearings every time the direction of motion is changed—2,000 times a minute. The lighter the piston the less the pound.

Running Cream Separator From Engine.

Please inform me through your paper how I can attach a two-horse-power gasoline engine to a 400-capacity cream separator. The engine runs 400 R. P. M.; the separator, sixty R. P. M. What size pulleys should I use for each; or could I belt direct from the engine to the separator?

Answer.—It would not be advisable to belt direct from the engine to the separator, as too much of the engine vibration would be transmitted to the separator. The speed of an ordinary farm engine also is too variable to operate a separator belted to it. It is best to use a countershaft. Drive the countershaft by a belt from the engine. Drive the separator by a belt from a governor pulley on the countershaft. The dealer from whom you purchased the separator can supply you with the governor pulley and tell you what size pulleys to use.

Unloading Hay.

I would like to ask a few questions concerning a hay hoist operated by a gasoline engine. There is a ten-inch pulley on the engine, which runs at 350 R. P. M. and develops four horse power. What would be the simplest way to attach it to the hay rope? Please show a diagram of the hoist and how to make a clutch for applying the rope. I enclose diagram showing location of hayloft and engine house.

Answer.—We are publishing the diagram of the location of the hayloft and engine house in Figure 1. E is the engine, L a line shaft in the engine room, T a trolley track for unloading the hay and OO are the holes in the floor of the loft where the ropes for moving the trolley pass through. Figure 2 shows a possible arrangement for operating the trolley from the engine. In Figure 2, E is the engine, L is the engine room line shaft, and W is a shaft extending entirely across the loft. This shaft should be one and one-half inches in diameter

FIGURE 1.

and should be supported every six feet by a hanger or bearing box. The drums for winding the rope that moves the trolley are located at each end. This rope is attached to the trolley at the middle and fastened to the drums so that when one drum is winding up the rope the other is unwinding. P is a pulley on line shaft, L. This pulley should be ten inches in diameter and twenty inches long. It is fastened on the line shaft, and may be made of wood. H consists of three pulleys sixteen inches in diameter, one having a straight face four inches wide, the

FIGURE 2.

other two a face eight inches wide. The middle pulley is keyed to the drum shaft, W; the two outside pulleys are loose on the shaft and retained in place by set collars. One crossed belt and one straight belt are used to drive the pulleys. When the belts are in the position shown, the drum shaft does not turn; when the crossed belt is shifted to the tight pulley, the drum shaft rotates one way and it rotates in the opposite direction when the straight belt is shifted to the tight pulley. In Figure 2, OO are grooved pulleys for guiding the rope.

J is a jackshaft driven from the line shaft, L. On one end of J is keyed a spool, S, located so that the hoisting rope may be given a couple of turns around it to hoist the hay from the wagon. R is a tight-and-loose pulley which makes it possible to start and stop the jackshaft at will. The sling pulleys should have a locking device. This applies also to the spool hay hoist recently illustrated in these columns, no such device being shown. A trolley complete with pulleys and locking device may be purchased for about $8.

Replacing the Acid in a Battery.

Could you inform me how to change the acid in a storage battery? Where could I get a book telling how to take a battery apart and repair it?

Answer.—If your local book dealer cannot supply you with a book on storage battery repair, write to any of the well-known catalog houses. Before withdrawing the electrolyte, give the battery a complete charge. The electrolyte is made by mixing distilled water or clean rainwater with sulphuric acid, using enough acid to make the mixture test 1.3 with a hydrometer. Then draw off the old electrolyte, wash out the battery with distilled or rainwater, put in the new electrolyte and recharge the battery at once. The plates must not be allowed to dry while changing the electrolyte. When mixing the electrolyte, slowly pour the acid into the water stirring the mixture with a glass rod. Never pour the water into the acid, as an explosion might result. Do not charge a battery too rapidly, as the life of the battery will be shortened by rapid charging.

Some Tractor Engine Questions.

Please tell me which is considered the better; a cylinder with removable head, or a cylinder with the head cast on the cylinder? How could the carbon be cleaned out of the cylinder with the solid head? Which is considered the better lubricating system for a tractor engine; a gear driven pump or the splash system?

Answer.—It is a disputed point as to whether the splash system or the forced feed oil system is the better. It largely depends upon the design of the motor. Often the geared pump is used in connection with the splash. As a rule, a splash system is not satisfactory on kerosene burning outfits, as the kerosene thins the oil. The splash system does not work well on two-cylinder opposed engines, as too much oil is thrown into one cylinder by the upward movement of the crank.

It is also a disputed point as to whether or not the head should be cast on the cylinder. If it is cast solid the entire cylinder must be removed to scrape out the carbon. However, it gives a more rigid construction than the removable cylinder head, and there is not the possibility of a leaky gasket, as is the case where the head is removable.

I Can Make You The Best PRICE

On Silo Filling Power
For Immediate Shipment

Save your crops!—Save $25 to $100 on first cost—Save 65 per cent on operating cost, using my Special Model Kerosene Engine. Don't overlook the big money-making possibilities in having reliable power on your farm this year, or the fact that I can give you more engine equipment, better prices and better service. You cannot afford to be without power for farm work NOW, when I will sell you a high-grade WITTE practically on your own terms—Cash—Payments—Bank Deposit or No Money Down—put your engine on the cars ready for business the same day I receive your order. Write for latest prices.

WITTE ENGINES

2 to 22 H-P.—90 Days' Trial—5-Year Guarantee

My Special Model Kerosene Engine is a jim dandy for ensilage cutters, blowers, threshers, and other heavy farm machines. No need to pay double to get the same quality as a WITTE, or take a cheap make to get a favorable price. Write today for my Free Book, which tells "How To Judge Engines"—why my engines have full-length bed, detachable, water-cooled cylinders that require no packing, vertical valves, and many other desirable improvements—years ahead of old-style engines. Every WITTE is shipped ready to run. No charges for Speed Regulator—Batteries—Pulleys, etc. Free Equipment—No extras to buy—No "catch" prices—Just a plain, square deal—You keep the middleman's profit—Get your engine when you want it. 4 H. P. Cushman Engine Mounted on Potato Digger

Saves Horses

Same engine does all other farm work.

The 4 H. P. Cushman is the Original and Successful Engine for Potato Diggers. Cushman Engine operates the elevator, shakers and sorter independently. Saves a horse or two and does cleaner and more rapid work. Slipping of traction wheel does not matter—engine does the work. Leaves potatoes clean and on top.

For All Farm Work

Same 4 H. P. Cushman is the All-Purpose Engine. May also be used on Grain Binders and Corn Binders, and for all other work. Cushman Engines are very light in weight and easy to move around from job to job. 4 H. P. weighs only 190 lbs. 8 H. P. 2-cylinder only 320 lbs. 15 H. P. only 780 lbs.—a splendid engine for silo filling, grinding, small threshers and other heavy jobs. Very steady running—no violent explosions or fast and slow speeds like ordinary farm engines. Equipped with Throttle Governor, Schebler Carburetor and Friction Clutch Pulley. Ask for free Book on Light Weight Engines.

The Wisconsin Farmer

THURSDAY, JULY 5, 1917.

FAMILY CIRCLE TALKS BY THE PUBLISHER

WHEN THE HARVEST CALLS FOR MEN.

I AM in receipt of a letter from Mr. F. G. Swoboda, county agricultural representative of Langlade county, which is such a valuable contribution on several vital questions now before the farmers of Wisconsin (farm help, prohibition, army enlistments, and so on) that I cannot refrain from printing it almost in full. Mr. Swoboda gives me the reassuring information that, thus far, the farm help situation in his part of our state has not become serious, although the time is not far distant when men will be needed badly. He raises the interesting point that the men who will not arm should be obliged to farm, rendering service in this manner to their country. But let Mr. Swoboda speak for himself:

Thus far farmers seem to have gotten on pretty well, for the most part. There have been some calls for help, but comparatively few. However, it seems evident that conditions will be different during haying and harvesting. A number of young men from the farms have enlisted and others will very likely do so. Some of our most promising young farmers' sons have already gone to the front. Some of them, I am sure, could have performed no more valuable service for their country than by remaining on the farm. They would gladly have continued to serve their country in the furrow; not that they were not willing and ready to go to war, but rather than be conscripted they volunteered.

Some of our business men are talking of closing up their stores one day during harvesting and haying season a week to help farmers gather their crop. The plan is only in the talking stage, but it seems to me it has merit.

Like most northern communities, we have a considerable number of lumberjacks hanging around saloons and boarding places doing little or nothing. It seems to me some plan should be devised to make these men work where needed.

Many of them are so booze soaked that they couldn't pass muster for enlistment. They won't voluntarily go on farms. Seems to me that as a matter of justice they should be conscripted for some form of service.

The day is coming, in my opinion, when the government will step in and see to it that the farmer is given the labor he needs to harvest his crops just as an officer is given men to command on the field of battle. The bugaboo of a "paternalistic government" will not always stand between us and the apex of production and prosperity. We have been afraid, in the past, of having the government —either federal or state—"usurp" some of our individualistic rights and prerogatives. That is one of the lessons which the war will teach us: That the government which protects and preserves us in times of war has the right to say how our work shall be done, and who shall do it, in times of peace. Certainly, a start cannot possibly be made in a better place than right on the farm, in harvest time, where men are needed as no place in all the land.

I do not know that Mr. Swoboda had this thought in mind when he wrote as he did, but it is one I have had in mind for some time. I shall have more to say along this line in the future; I simply advance the idea now, in a general way, so that you may be thinking it over and be prepared to express yourself, either in agreement with me or in argument, when we can take it up together more in detail.

PRODUCE AND SAVE.

WHILE the problem of food production is the farmer's, the problem of food conservation is largely the city man's. It will avail the nation little if the farmer makes his acres and his herds produce to the utmost, in the present crisis, and extravagance continues to waste that which he produces.

I am glad to find a timely note of warning uttered in one of our large magazines, The American. It is directed particularly to the city man, but because I believe the farmer wants to know the ultimate use to which his produce is put I am going to reprint a portion of it. The magazine writer is arguing that there is something which every person—regardless of age, station and occupation—can do in the present emergency, and that is to conserve the world's all-too-little food supply. He is frank to admit that the cities are the centers of extravagance. Then he goes on to give this advice to the city man:

You who live in the cities have to lead the way. Otherwise, it is no use to preach food thrift to the millions of rural folk who are comparatively thrifty as it is.

If you can't serve your country at the battle front you can serve her at the dinner table. Give up your suppers after the theater, your midnight lunches after a party. Every time you eat a late evening meal you are taking food from the bare cupboards of our fellows across the ocean.

Eat at home. A housewife can reckon how much food her family needs. A public caterer has to have enough for all possible guests, and a great deal is wasted. Dinners out should be reduced to a minimum.

Stop asking a lot of guests to dinner every few days, and making an unnecessary and unholy show of much food. Parties of this sort are going to come mighty close to disloyalty in the days ahead. The society woman who gives a tea or dinner to a couple of hundred guests is committing a national crime. There is no occasion on which it is necessary to entertain more than ten or a dozen persons. One can get all the wit and brilliance in that number that anyone needs.

Don't just do these things yourself—create a public opinion against them. Preach and live the gospel of the clean plate. Everyone in America ought to be forced to eat everything on his table. In that event a good many of us would die of indigestion, and most of the rest would learn that an altogether unnecessary amount of food is being cooked.

That is good advice, every word of it, and I sincerely hope that it will be followed. Enough food is wasted in the average city hotel to feed many poor and deserving families; enough is wasted on the average table, both in the city and on the farm, to care for many a starving man. Shall we not see to it, regardless of where we live, that this waste is stopped? Preach and practice the gospel of the clean plate so that we may lie down to sleep untroubled by the thought that what we wasted would keep a human life going. The magazine writer who gave the city man such good advice again hit the nail on the head when he said:

There is going to be a short loaf over across the water, anyway—a tremendously short loaf. The nations who are fighting with us—fighting for us, today—are facing something pretty close to famine. Every blade of wheat, every spear of corn, every potato or other foodstuffs that one of us can bring up will go toward making that loaf just a little larger. The man who can make two hills of beans grow where one grew before is hurling a bomb at the enemy.

But there is an even greater service for all of us. Cut down waste! We are throwing into our garbage pails enough foodstuffs to keep countless people from starvation. Do you know that it would take 400,000 acres of wheat land to make up the loss sustained if only one slice of stale bread a day were thrown away in every American household?

Produce to the utmost; save to the limit. In no other way can the hungry be fed; in no other way can the war be won. We are in this war not for conquest or for martial glory but to put an end to militarism, to despotism. That is the great object. But if, in doing this big and necessary thing, we should incidentally put an end to the things which have hurt ourselves, which have held us back from real greatness, shall we not do so? He also serves who saves, remember that.

REQUIREMENTS FOR THE ARMY.

I AM in receipt of many letters from farm boys asking what the physical qualifications of a soldier are. Perhaps it might not be amiss to give this information here.

Not all the farm boys who will be drafted will ask to be exempted. The adventurous spirit is abroad in the country as much as in the city. Patriotism is rampant in cornfield and feed lot. Therefore, we may expect that many of the farm boys who are summoned to the colors will want to go. What tests must they pass, before the examining officers, to make good?

I am advised by military authorities that the successful applicant for the army must be at least five feet, four inches, in height, and not over six feet; he must weigh not less than 128 pounds nor more than 190. His lungs and heart must be well-nigh perfect. Any heart "murmur" will disqualify. His hearing and sight must be good; color blindness is not necessarily a disqualification. Loss of fingers or toes or an ear are disqualifications. Chronic diseases or mental disorders will disbar any applicant. At least four molar teeth are required. Deformed feet will keep a man out of the army, so will flat feet.

I have an idea that many a farm boy who, to all intents and purposes, is a perfectly healthy specimen of manhood, will find, to his great amazement, that he cannot pass all these army tests. I have in mind a strapping young fellow, a great athlete, who, to all outward appearances, is physical perfection. Yet this young fellow is flat-footed. Should his name be drawn for army service he will undoubtedly be rejected. The army wants men who can stand long, hard marches; the flat-footed man will be rejected.

By the time these words are read the manner in which the first conscript army is to be drawn will probably have been announced in the daily papers. The plan, at present, seems to be this: Every man who registered on June 5th will have a number assigned to his registration card. Thus, supposing a farm boy was 85th in line at his polling place; his card will be numbered 85. Suppose a city boy, in a heavily-populated precinct, was 510th in line; his card will be numbered 510. Now, it is proposed to draw from a box or wheel, in Washington, a great number of cards, and the numbers on the cards thus drawn will be the numbers which are to be taken, in every precinct and registering place in the United States, both city and country. Let me illustrate: Suppose the first card drawn in Washington has the number 85 on it. That means that in every registration place in the United States, town and country alike, the boy whose card has the number 85 on it will be drawn for army service. The names of the men drawn will not be known until in each township or precinct the lists are looked up to see whose card is numbered 85. Or suppose the number drawn is 500. There may be thousands of townships and precincts where the registration on June 5th did not reach 500; in that event no one in those townships or precincts will be drawn on that number, only the larger polling places will be affected. This will result in cutting down the country's representation in the army—a consummation devoutly to be wished, in my humble opinion.

I hope to be able to announce the plan, in full detail, in a week or so. The army camps or cantonments are already started, men are working like beavers to get the soldiers' habitations ready. We shall have an army of a half million drilling within a few months. In the meantime we must grow large crops, economize on food and trust to God that all will come out right in the end.

GETTING OUT OF THE RUT.

OFTEN the mail brings me letters so filled with heart interest, so throbbing with human emotion, I feel as though I could not delay a day in passing them on to you. I am tempted to stop the presses and publish them immediately, so eager am I to give the assistance asked or to receive advice and suggestions from my readers as to how to cope with the problem presented. I am free to admit that no letter received in several weeks has affected me more strongly, or made me more eager to give the needed aid, than one which came to me a few days ago from a Wisconsin farm woman. Her loyalty to her husband, her willingness to share any burden with him, her eagerness to get ahead, her unbounded ambition to prove to her parents that in marrying the man of her choice she made no mistake, her loving efficiency as a mother, her all-around worthiness seem to me to stand out in every sentence. I do not have the pleasure of a personal acquaintance with my correspondent; I know nothing of her except what the letter sets forth; yet I am intensely interested in her case. I want to do anything I possibly can to help her out of the rut where she is wearing out her soul and body. Read her letter and see if you can help me to help her:

We are one of your subscribers and do enjoy your paper so much. We always turn to the editorials first and find them so interesting and helpful. You seem to understand people so well and make such helpful suggestions to the ones that come to you for advice. I told my husband that I was going to write you and maybe you could tell us what we could do and help us, so if you will be patient with me I will tell you something of ourselves so you will understand the "why" of the request we make.

We are "hired help" and have been for a number of years. We get $40 a month, house, garden, milk and half the chickens and proceeds. That is not bad wages, but as we have four small children it is pretty hard to get along and try to have a little laid by for sickness and the unexpected. My husband is a hard-working man, steady, sober, reliable, and is always at work, no matter what the weather or where the "boss" is. He attends strictly to business. But we seem to be in that everlasting rut. We keep out of debt, but never seem to get ahead any to speak of, no matter how we try. While still real young my husband had to leave school to support a widowed mother, so did not have the advantage of many of a financial start before marriage. We have lived in town and on the farm and find the farm the best. We are always out of debt, or at least while on a farm, but while working in town we are sure to get behind. We try so hard to get some money laid by so that some day we can start on a farm for ourselves, but with our family of little ones it seems impossible. We are not the roaming, shifting kind. We are on our second year here, to the surprise of all the neighbors, as the man we work for is considered a hard man to work for, but we have had no trouble and he

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES.

BY JAMES M. PIERCE

JAMES ATKINSON, EDITOR-IN-CHIEF

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter.

PUBLISHED EVERY THURSDAY

1912 Grand Avenue Des Moines, Iowa — 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscriptions or advertising may be addressed.

Member Agricultural Publishers' Association. Member Audit Bureau of Circulations.

SUBSCRIPTION RATES—Single subscription, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. Single subscription three years in advance, $1.50; five years in advance, $2.50; ten years in advance, $5.00. Subscription price in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as before or state both the old and new names and explain why you change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address

THE WISCONSIN FARMER, Madison, Wisconsin

Wisconsin Eagle at Philadelphia.

A Wisconsin eagle, a perfect likeness of "Old Abe," famous during the civil war days, was to fly with forty-nine others on July 4th at 12 o'clock from the tower of Independence Hall at Philadelphia in commemoration of the fiftieth anniversary of the closing of the civil war. The year 1915 was really the exact year in which to celebrate, but Philadelphians were not ready at that time or in 1916, so they made all their plans for a great celebration on Independence Day this year. Every state in the Union and the colonies were to be represented by an eagle which was to be set free at noon on the 4th of July. Each state and each of our possessions were asked to send a large flag—15x8 feet—and a tablet 15x22 inches with the motto of the state and the name and year inscribed. The flags and tablets will be hung in Independence Hall. The Wisconsin tablet is of the same wood that the state capitol is finished in, Wisconsin oak, and has on it in gilt letters our motto, "Forward," and "Wisconsin, 1917."

The eagle for the celebration was furnished by Mead Theobald. The authorities were in doubt as to the possibility of getting an eagle in time for the celebration. Mr. Theobald's neighbors at Barneveld informed him of Wisconsin's predicament and with true patriotic impulse Mr. Theobald brought his eagle to Madison. The eagle was caught by young Lester, son of Mr. Theobald, last January. The trap had been set for a fox, but the eagle, hungry for a meal, descended on the bait and was caught in the steel trap. Lester promptly took him home and kept him in an old garret. The eagle measures six feet from tip to tip.

Those that claim to know something of the habits of the eagle say that this bird will come back to Wisconsin upon being liberated and if you happen to capture or shoot an eagle within the next year examine his left foot and if on it is marked the name Wisconsin he is the eagle that was sent to the celebration at Philadelphia in 1917.

Dean H. L. Russell's Anniversary.

Dean H. L. Russell, head of the Wisconsin College of Agriculture, celebrated on June 19th his twenty-fifth anniversary as doctor of bacteriological science. Dean Russell's services as head of one of the greatest agricultural schools of the world, and without doubt the greatest dairy school of the world, date back ten years and he has been a member of the university faculty for twenty-four years.

The most conspicuous work has been done by Dean Russell in regard to bovine tuberculosis. At the time he came to the University of Wisconsin practically nothing had been done in regard to tuberculosis in cattle. Russell, fresh from his studies in Europe and at Johns Hopkins University, had given considerable attention to tuberculosis. He tested the university herd for the first time in 1894 and since that year every animal on the university farm has been tested once every twelve months. He instituted educational campaigns and slaughtering demonstrations which gave Wisconsin farmers complete knowledge of tuberculosis as far as science had been able to analyze it. Bulletins and circulars treating of the necessity for greater care against infection and spread of the disease went out under the direction of Dean Russell for many years. The efforts of Dean Russell coupled with other work that has been done by various bodies in the state has popularized the tuberculin test in Wisconsin and has made Wisconsin farmers recognize the value of testing. Wisconsin will in the next few years prove how much she is ahead of every other section of the country in the work of eradicating tuberculosis.

We do not by any means wish to convey the idea that Dean Russell's services to the state are confined to his activities in the fight on tuberculosis. He has been the mainspring in a number of campaigns which have resulted in state-wide benefit. It would take a review of the work of the college of agriculture to enumerate all this. Dean Russell is right now at the height of his usefulness as far as agricultural and live stock interests of the state are concerned.

The Theory of Shallow Corn Cultivation.

Considerable experimental work has been done at our stations to demonstrate conclusively that the practice of cultivating deeply after corn is a foot high greatly reduces the yield. This can be well understood when we consider that three-fourths of the roots of the corn plant are found in that part of the soil that has been turned by the plow. The laceration, therefore, of even a part of these roots will intercept the plants' ability to take up food and moisture, and this has a direct effect on the yield. If a field of corn is fairly free from weeds one had better let it alone rather than to do a lot of root pruning.

The Illinois station has done a great deal of experimenting along this line and as the result of eight years' work it was ascertained that corn that was never cultivated, but the weeds simply allowed to grow in their own sweet way, yielded 7.3 bushels per acre. On the other hand, where weeds were kept down without stirring the soil the yield was 45.9 bushels per acre. Of course, no man would think of allowing his crop to go uncultivated, but these results show the extreme yields that might be expected from the two methods of handling the soil. According to the Illinois station, there is little advantage in cultivating corn unless there are weeds to be destroyed. This applies particularly on mellow soils, though on the clays frequent stirring of the soil will mean thrift to the plants.

Recent investigations seemed to belittle the advantage of the so-called dust mulch for the simple reason that well-developed corn roots will take up the moisture that comes from the lower soil and prevent its evaporation. This being the case, the important thing in corn cultivation is to keep the weeds in check without stirring the soil deeply. At the Missouri station it was found that corn cultivated four times shallow yielded 66.9 bushels per acre, whereas four deep cultivations resulted in a yield of 53.5 bushels per acre. Here was a direct gain of 13.4 bushels per acre. In the same field a small area was kept free from weeds with the hoe and the surface soil practically not disturbed. The yield in this case was 63.8 bushels per acre, thus demonstrating that, after all, the important thing to be learned in handling the corn crop is to keep the weeds down, and the one thing above all others to be avoided is that of cutting into the soil deep enough to lacerate feeding rootlets.

Drainage Suggestions.

Under the direction of the Wisconsin State Council of Defense, E. R. Jones, secretary of the Wisconsin State Drainage Association, has issued drainage suggestions as follows:

1. Have your dead furrows extend in the line of greatest slope on the flatter lands.
2. Plow in narrow lands not over four rods wide so that there will be a dead furrow or a back furrow ever two rods.
3. Plow twice in the dead furrow where it crosses a ridge. In long, level furrows, plow twice near the outlet to create a fall toward the surface run.
4. Use a light road grader or a V-shaped ditcher to make the surface run into which the dead furrows can discharge.
5. Cut a trench through the sod to the fence to connect the dead furrow with the road ditch or surface run outside the fence. Don't dam the dead furrows.
6. Clean out the dead furrows after seeding or planting. Use a spade or hoe, or smash the lumps by dragging a log down the furrow.
7. Have corn rows extend in the same direction as the dead furrows so that they will not be filled up by cultivation.
8. Slope your dead furrows in fields of small grain so that you can cross them with a binder without jolting.
9. Keep an eye open for the wet spots on which water stands after each rain, and fix up the dead furrows before the next rain.
10. Get busy with a spade or a hoe as soon as it stops raining. Every spadeful of earth means a shovelful of corn.

Mr. Jones writes that he recently spent a couple of days in Jefferson county, carrying the gospel of drainage from farm to farm. As an illustration of the negligence on the part of one farmer in particular, Mr. Jones writes he noticed water standing in three dead furrows about four rods apart on an acre of excellent flat clay land which had been seeded to oats. This land was dry when seeded, but rains had flooded it. Mr. Jones got hold of the man who had put in this crop and with his instrument convinced him that it would be easily possible to give an outlet to the dead furrows. The farmer said to Jones, "Some day I will take the plow and plow a furrow across the end of these dead furrows and let that water get away." But Mr. Jones said, "Let's do it now." So a team was unhitched from a wagon and hitched to the plow. The furrow was plowed where it would do the most good—plowed twice across a little ridge. Mr. Jones writes that the water followed them so fast they had to keep off to one side to keep their feet dry. In thirty minutes all the furrows were empty. The side of the furrow made was trimmed with a spade, so that it might be crossed easily with the binder. This work did not exceed one hour for the whole job and it is a good example, as Mr. Jones writes, of what may easily be done to help save a crop.

Seeded Alfalfa in Corn Successfully.

A recent issue of the National Alfalfa Journal contains a communication from Mr. C. L. Woodward, of Brookings county, South Dakota, on the question of seeding alfalfa in corn previous to the last time of cultivation. The venture in this case was singularly successful and we believe that Wisconsin Farmer readers will be interested in what Mr. Woodward has to say. He writes:

Thinking my experience with the "cornfield method" of seeding alfalfa might interest your many readers, here it is as best I can give it.

Having decided to make a start with alfalfa, naturally I began to look up methods of seeding it. I read articles in the various farm papers pro and con of various methods and talked with my neighbors, all of which naturally resulted in some confusion and a decision was up to me alone. On one thing all seemed to agree, that from ten to twenty pounds of seed per acre were needed.

Finally a neighbor called my attention to a new and novel way to me of seeding alfalfa. He said that he had just run up against a new method and that it looked good to him. He said this new method consisted of sowing the seed with a press drill in standing corn at the last cultivation. This method appealed to me after he had fully explained it, for these reasons:

First. The cornfield at this time is a perfect summer fallow and all weeds are eliminated.

Second. At this time of the year there is sure to be moisture in the soil of the cornfield.

Third. The growing corn will protect the tender alfalfa from scorching winds, hot sun and sand storms.

Fourth. The cornstalks form a snow catcher in winter which gives early moisture in the spring.

Fifth. I am sure of a bumper crop of corn, and lose nothing but my alfalfa seed in case of a failure of alfalfa, and last, but not least, I save 50 per cent on the cost of seed, because this new method requires only about six pounds of seed per acre.

After debating the matter pro and con, we decided to procure a drill, my neighbor wishing to sow twelve acres and I about four acres. I seeded my four acres in one end of my twenty-acre cornfield. I followed directions carefully when cultivating my corn, not hilling it, and kept it clean from weeds, and when the corn was ready to "lay out" I hesitated about sowing my alfalfa because of the very dry, loose condition of the soil, so I waited till the last of July before drilling in my seed and drilled it in just after a shower. I used six pounds of seed per acre with the following results:

I have a good stand of alfalfa; I had a clean field of corn, a full crop of corn, and my alfalfa going into winter, not very tall, but green and all alive on December 1st. Of course, my late seeding and the unprecedented drouth caused a lighter growth of the alfalfa than would otherwise have been the case, had the usual moisture been present. Others who have given this method a longer trial tell me that with usual moisture and on well-manured soil the growth of alfalfa will be from one to two feet the first fall.

Those of our readers who might feel disposed to try this plan should bear particularly in mind that the alfalfa in this case was seeded with a drill. This means that the seed was uniformly covered and in a measure it accounts for a good stand resulting, even though but six pounds of alfalfa was used in the seeding. As a rule, the sowing of pasture or forage crops in corn previous to the last time of cultivation is not successful for the reason that a poor stand generally results and this poor stand can be traced to the fact that the seed is not well covered with soil. The question of a good covering applies to rape, peas, rye or any crop that is sown in midsummer.

Three Big Problems.

The three big problems of the day from the farmer's standpoint are these: Production, marketing, conservation. Every acre must be made to yield to its utmost. The crops must be marketed to the best advantage. Foodstuffs of all kinds must be taken care of, so that there will be no waste; extravagance must be cut out, the gospel of the clean plate must be preached and practiced by all.

Every issue of The Wisconsin Farmer will be found to contain practical, dependable articles dealing with each one of these three big problems: Production, marketing, conservation. These articles are written by men who know what they are writing about. They alone are worth the subscription price of the paper. But the departments are maintained intact, giving the farmer advice on every question of practical farming as it arises in his daily work.

Such a combination of usefulness and interest was never maintained before by any farm paper. It is of the utmost importance, therefore, that every subscriber see to it that he is paid well in advance and that his friends and neighbors likewise subscribe to The Wisconsin Farmer. The date of your subscription expiration is shown on the label upon your paper. Look at it and renew promptly. Induce as many other farmers as possible to subscribe, so that prosperity may be passed around generally and all may take advantage of the splendidly efficient articles and editorials in this paper.

Cutting Down Labor in Haymaking.

It is doubtful if the hay crop has been as light as it is this year more than once in the last two decades, this being due to the winterkilling of meadows. In spite of this fact, however, there will be millions of tons of hay cured in the central West and haymaking operations will soon be under way. Help is scarce and the quick way will be the best way this year. In most instances there will be no time for putting the hay in shock and the curing will in the main be done in the windrow.

The theory of haymaking is an interesting one, because good hay depends upon the degree of success that is attained in getting the moisture out of the stems through the leaves without allowing the leaves to get dry enough to shatter off. It must be remembered that the leaves of any plant are richer in food materials than the stems, so that much exposure to the sun, while the hay is spread thinly on the ground, means that the leaves will suddenly shrivel up, the pores close, and at the same time the moisture in the stems will remain.

To prevent the drying up of leaves, which amounts to the same thing as

FAMILY CIRCLE TALKS—By The Publisher.

(Continued from page 3.)

is very good to us and raised the wages this year of his own accord. Our year is up again November 1st, but will stay unless something better appears. We left our last place because the owner wanted to cut our wages down, but since has told my parents he has been sorry many times he let us go and we could come back any time and that my husband was the best man he ever had.

Mr. Pierce, I know I am taking up your very valuable time and am tiring you with my "tale of woe," but we get so discouraged at times and it seems as if there ought to be some way out. My husband is too good a man to be plodding along year after year behind someone else's plow for a mere existence. For twelve long years I have prayed to the all-wise Father for the time when we could better our condition, but it seems the Lord hasn't seen fit to answer my prayer. What I would ask you, Mr. Pierce, isn't there some way my husband could qualify for a better farm position? He has had a good dairy experience, as well as general farming. What is this new position of cow testing? We know of a young man who took up that work and surely he must have studied it up while doing other work. In fact, I know he did. I also happen to know he is getting $60 a month, with all expenses. Of course he had to pay for his knowledge, but gladly would we do that if we could only provide better for our children and make our farm home come a little nearer. My husband cannot go away to study, for he has to work and we have not the means. This work seems to be something new, so will likely be in demand for some time to come. Won't you tell us more about it or put us in touch with someone who can? Three different times have we tried to get someone to finance us to start on a farm, but without success. My people all are pretty well fixed in this world's goods, but none seem to think they could give us a little "boost" and at the same time they say: "Why didn't I marry someone better off?" and such talk. I just made up my mind I would send my appeal to a stranger-friend and maybe there would be some results. For the sake of our little ones won't you help us to help ourselves? We would be so grateful to you, Mr. Pierce, and work so hard and try to show you by results how we thank you.

Is not this a case deserving not only of our sympathy, but likewise of our assistance? Think of this hard-working, loving wife, fighting against the fate which has held her and her loved ones down, no matter how hard they toil, how hard they struggle to better themselves. Do you wonder that I answered this letter immediately, giving what little advice I could in the emergency? But I feel as though we must not stop here. Surely, somewhere in our family circle is a farmer needing the help of just such a family. Will he write to me, so I can bring him in communication with my correspondent, so that this husband, wife and little ones can go over the parapet of their rut—like soldiers over the parapet of a trench—and charge across the field which leads to victory? There must be others who can tell, better than I, how to succeed in this cow-testing work which so interests my correspondent. There must be others who know of farms which can be taken over by this family and on which they can find their long-delayed, but none-the-less-deserved, opportunity.

There is nothing more pathetic to me than the struggle of the deserving to get ahead. I may be imposed upon now and then, but I would rather be "taken in" a score of times than to lose one golden opportunity to help one deserving man or woman. Write me your advice; let us work together, so that the sun of hope may finally dawn after the night of dark despair and, hand in hand, husband and wife may lead their brood of little ones into the promised land of independence.

James M. Pierce

getting rid of the moisture from the stems, it is necessary to get hay into the swath as quickly as possible. Where there is plenty of help to handle the crop, of course, one can go a step further and put it in the shock, but we assume that this year there will not be one farmer in ten who can take the time to shock his hay. If he cuts in the forenoon and the weather is at all drying, he can possibly rake the day's cutting into windrows before night, or at least the following forenoon. The side-delivery hayrake has made it possible to hasten drying by turning over the windrows the second or even the third time. In this way the moisture contained in the stems is eliminated and the leaves do not become dry enough to shatter off.

In many instances hay is spoiled by leaving it scattered thinly in the hot sun for a few hours and then putting it in the stack or in the mow. It may have a dry feeling to the touch, but there is a great deal of moisture left in the stems, so that it is apt to heat to the point when stored that greatly impairs its value. In most cases this year hay will not be touched with a hand fork until taken away from the carrier of the loader, or when it is pitched in the field where there is no loader. It may not be quite as good in quality when cured in the windrow as if it is cured in the shock, but, all things considered, we must be satisfied with a product of lower quality if we can materially cut down the labor involved in haymaking.

Act Quickly When Hog Cholera is Suspected.

A few alarming outbreaks of hog cholera have occurred in certain parts of the central West and in view of the fact that the hog crop is light and that there is an urgent necessity for large meat production this year, it is exceedingly important that every precaution should be taken to prevent the spread of the disease. The department of agriculture is doing its utmost to spread information in regard to this matter and in a recent press bulletin swine raisers are advised to act quickly when a sick hog shows up. We quote from the bulletin:

Don't take a chance with a sick hog. Act quickly. Get a veterinarian or a trained man immediately. Don't wait a single hour when you suspect disease in your herd. Use the telephone or send to town at once. Only prompt action will stop hog cholera losses. Every hog saved will help win the war.

This is the message of tremendous importance which the United States Department of Agriculture is carrying to farmers, not only in the great hog belt included in Iowa, Missouri and Illinois, and near-by states, which produce 34 per cent of the hog output of the United States, but also to farmers of the South, where in several states in 1916 hog losses due to cholera rose to two to three times the average losses for the country. Hog losses in 1916 by disease rose to 130 per 1,000 in Arkansas, 105 in Louisiana, 100 in Florida, eighty in Georgia, seventy-six in Tennessee, seventy in Alabama and sixty-five in Mississippi, against an average of forty-eight per 1,000 for the entire country. At least 90 per cent of these losses were attributed to hog cholera.

The time for argument about anti-hog-cholera serum is past, declare the specialists of the bureau of animal industry, United States Department of Agriculture. Explicit figures are readily available which prove unmistakably that, when administered in time by competent persons, hog cholera serum will keep well hogs from taking the disease for a period of three to six weeks. Not argument but quick action is imperative to get serum and a trained operator to the farm to treat the hogs. Hogs will be saved and the nation's meat supply increased if every farmer will immediately upon sign of disease call in the nearest available expert to diagnose the complaint and administer whatever treatment is necessary.

The department of agriculture is urging that all state, county, and local live stock interests, including state veterinarians, live stock boards, state college workers, county agents and local veterinarians, begin immediately to organize anti-hog-cholera preparedness campaigns to reach every farmer in every county. Such organization already exists in many places. Where it does not there is need of special and immediate action before the hot weather conditions favorable to hog cholera come on.

Bankers and other business men can aid in the work of informing farmers where they can get expert help immediately when they suspect cholera in their herds. Lists of accredited persons competent to diagnose cholera and administer serum, together with their addresses and telephone numbers, should be furnished to each farmer in the county, with the appeal that he call for help at once in case of need. Business men may also arrange through the local veterinary authorities or county agents to buy serum at the nearest state serum plant, private plant, or serum depot and hold it in reserve for emergency use. State and federal animal industry authorities should be notified at once by telegram of any outbreak.

Because a single outbreak of hog cholera on any farm is a matter of moment to the entire community, and because hog cholera infection is rapidly spread in many ways, the department of agriculture is urging farmers to employ every possible measure to keep the disease out of their herds. The department has issued a special hog cholera poster—"Stop Hog Cholera Losses"—which gives specific directions for avoiding infection by sanitary and self-quarantine measures; also directions for the isolation and treatment of cholera-infected hogs, and directions for disinfection and restocking the hog lot. Farmers' Bulletin 834, soon to be published, contains the latest information at the command of the United States Department of Agirculture concerning hog-cholera prevention and the immunization of hogs against the disease.

The bulletin here referred to, namely, No. 834, should be in the hands of every man who owns a herd of hogs and we advise our readers to send for it to the department of agriculture, Washington, D. C. Every swine breeder should be prepared to act quickly when disease makes its appearance, not only because it will be of great benefit to himself to do so, but because it will afford protection to the entire community in which he lives.

Still Good Demand for Horses of Right Type.

It is the prevailing opinion of men who have a comprehensive knowledge of agricultural and industrial conditions that there will always be a satisfactory market for good, sound, heavy horses. Dr. C. W. McCampbell, of the Kansas station, says that draft horses have increased in value 10 per cent during the past ten years, judging the matter on the basis of the Chicago market reports. He says that all horses passing through that market in 1906 that would classify as drafters, including the good, bad and indifferent, averaged $190 a head. In 1916 the same class of horses averaged $210 a head. The demand for horses on farms and the influence this demand exerts in making horse values is shown by the fact that under normal conditions only 1.5 per cent of the horse population of the country passes through the central horse markets annually.

The profitable type is the sound, good looking, bold going, easy keeping, durable horse, weighing, in working condition, 1,500 pounds or more. Such a horse not only meets the needs for efficiency and economy in farming operations, but it also sells for the high dollar on the open market.

Market reports show that the bigger the horse the better the price, provided size is combined with quality and substance. Common 1,300 to 1,400-pound chunks bring $165 to $185; medium-weight chunks (1,400 to 1,500 pounds) with flesh and quality, $190 to $215; heavy-weight chunks (1,500 to 1,600 pounds) $200 to $225; horses weighing 1,600 pounds or more, ready to go to work, $175 to $350.

If the producer hopes to raise the most efficient farm horse, which is also the most profitable market horse, he must observe more carefully the fundamentals in profitable horse production, believes Doctor McCampbell.

Horse raisers must study more carefully changing economic and market conditions which affect horse demand, values and prices, and determine whether these changes are permanent or only temporary. Horsemen must study more carefully those features of conformation and soundness that make a horse a good individual. Breeders must study the various types of horses that they may be better able to select the efficient and profitable type.

Recognition of Wisconsin's Agricultural Industry.

Gov. Emanuel L. Philipp has very properly recognized the agricultural and live stock interests of Wisconsin by naming a prominent representative of these important industries as a member of the new state board of education. We refer to the appointment of Chas. L. Hill, of Rosendale. Mr. Hill is well known by our readers as a prominent Guernsey breeder, a successful farmer and a public speaker on both agricultural and political subjects. As a sign of the times, it may be mentioned that Mr. Hill is also a prohibitionist, having been standard bearer of that party in campaigns for governor and United States senator. The present legislature has increased the state board of education from five to nine members. Of the nine comprising the new state board, five are appointed by the governor, one is to be appointed by the board of regents of the university and one to be selected by the officiary of the state normal schools. This provides for seven members and the governor and superintendent of public instruction are ex-officio members. By special provision of the law the secretary of state is an ex-officio member until January 19, 1919.

It is the duty of the state board of education to examine and audit through its accountants the finances of all schools receiving state aid and recommend to the legislature appropriations for the different schools. Mr. Hill's term will end August 1, 1920.

Stacking the Grain.

The Wisconsin Experiment Station gives the following brief review of well established advantages of threshing grain from the stack rather than hauling it direct to the separator from the fields:

Sweating in the stack greatly improves the quality and color of grain. This is especially valuable with wheat and rye.

Grain which goes through the sweating process in the stacks is better than that which is left to sweat in the bin.

Heavy rains will not hurt well-stacked grain. Oats are decidedly susceptible to dampness, and will not readily dry out in the shock.

Stack-threshed grain can be piled in a smaller place than shock-threshed grain with less chance of injury through heating. It does not require so much watching after storage.

Sudden showers during threshing time do not delay operations when working from the stack. When threshing from the shock the reverse is frequently the case, and all hands must wait because the shocks in the field have become water soaked.

Remember 1915. This was a damp threshing season and thousands of bushels of grain were lost just because it wasn't safe in the stack where it should have been.

County food emergency agents are starting a concerted campaign to interest farmers in stacking their grain. Shock threshing is better perhaps for the man who is early on the list, but woe unto those who must wait through all kinds of weather and run the chance of having shock grain in the field sprout or discolor from the rain.

Land-Clearing Demonstrations.

Among the important bills passed in the closing sessions of the general assembly was one appropriating $37,000 for continuance of land-clearing demonstrations in Upper Wisconsin. This is the work which was so well started by the late Carl Livingston. Prof. F. M. White, of the agricultural engineering division, college of agriculture, will take personal charge of this work this season or until it is possible to find a man who can direct the demonstrations. At this writing it is impossible to give a definite schedule of the demonstrations, which will start about July 10th or 15th, but local papers will give sufficient announcements to apprise the communities in which the demonstrations are to be held. The demonstrations will continue several weeks and many points in Upper Wisconsin which were not reached last year will be visited.

Under the provisions of the bill as finally passed this demonstrational work will continue for two years. Professor White will be able later to give the state a review of this work. It was unfortunate that Mr. Livingston was unable to arrange the result of his work in bulletin form, and this matter caused him to worry a great deal during his last sickness.

As many of our readers as are able to do so should plan to attend the demonstration nearest to them, and make a careful study of the most economical methods of land clearing.

How to Fight the Potato Bug.

Wisconsin Potato Growers Advised to Profit by 1916 Experience—By J. G. Milward, Wisconsin Experiment Station.

PARIS green, arsenate of lead and other poisons will each kill potato bugs effectively, if applied in time. The choice of these different materials is of less importance than the following direction: Apply poisons on time and do the work thoroughly.

Potato growers, remember your experience in 1916! Not over 14,000,000 bushels of potatoes, or less than half a crop, were harvested in Wisconsin in 1916. Bug injury, tip burn, arsenical burning combined with a dry, hot season caused this serious damage to the potato crop.

The old beetles after wintering in the ground emerge about the time the vines appear above the ground. They mate on the young vines and colonies of orange-colored eggs are laid on the under sides of the leaves.

Hand pick old beetles on small areas. The old beetles and also leaves containing eggs may be removed and destroyed on gardens and small fields.

MATURE BEETLES AS WELL AS THE BUGS OR LARVAE DESTROY POTATO TOPS.

In a few days the eggs hatch and the young larvae or "bugs" will, as a rule, gather in colonies or clusters on the tender, terminal shoots and begin to feed.

Apply poisons when young colonies begin feeding. A very small amount of arsenic will kill the young bugs at this time. If left to feed for several days and grow to large size, large amounts of poison are required to kill them. Badly damaged vines never regain healthy growth and development.

THE LARVAL OR "BUG" FORM OF THE POTATO BEETLE.

Carelessness is often noticed in the use of excessive amounts of poison and faulty working of machinery. During hot, showery weather, severe losses result under these conditions from a combination of bug injury, tip burn and arsenical burning.

Most poisons may be either added to water and applied as a liquid spray or dusted on the vines.

Paris green will kill at the rate of two pounds to fifty gallons of water. Many potato growers prefer to use three pounds to fifty gallons. Paris green, applied at this rate in water, during hot, showery weather, may cause some arsenical burning.

To avoid Paris green burning, add to each barrel of spray about two pounds of lime, after slaking lime carefully.

Growers who have spraying machines and equipment for making Bordeaux mixture will find it satisfactory to apply Paris green with a dilute Bordeaux mixture:

BORDEAUX MIXTUE FORMULA.
(Half strength.)

Blue vitriol	2 pounds
Stone lime	2 pounds
Water	50 gallons

This method will prevent all Paris green burning and also controls the flea beetle and other leaf-eating insects.

Paris green in dry form may be dusted on the vines, mixed with flour, land plaster or air-slaked lime at the rate of one part of Paris green to three parts of the dry powder used. Paris green is sometimes used dry and undiluted when dust blowers are available.

Powdered arsenate of lead and Paris green have been used successfully by some growers at the rate of one pound Paris green, two pounds powdered arsenate of lead and fifty gallons of water. This can be used with the dilute Bordeaux mixture.

Powdered arsenate of lead may be added to water and sprayed on vines at the rate of four pounds to fifty gallons. It may also be dusted on vines diluted one part arsenate, three parts air-slaked lime, flour or land plaster. It is also used pure in the dry form where dust guns are available. Paste poisons are not advised on account of difficulty and loss of time in mixing. Buy the powdered arsenate.

THE MATURE POTATO BEETLE.

Newer forms of poisons, arsenite of zinc powder, zinc Bordeaux paste and other commercial products will be used to a limited extent in several sections of the state. Arsenite of zinc powder may be used at the rate of three pounds to fifty gallons of water and paste forms at the rate of four pounds to fifty gallons.

On the average it requires three applications at close intervals to completely control the bugs. This varies with the season and the seriousness of infestation. Usually the egg-laying period lasts several days. The vines grow rapidly. The bugs crawl to new and unsprayed growth. The weather may be showery. For all these reasons, growers should watch carefully for the need of repeated applications.

If a large part of the early hatches escape into the ground, they will emerge again as adult beetles in about ten days' time (August 1—August 5). This second brood is very active, hard to kill and often seriously strip the leaves from the vines.

Hand atomizers, knapsack sprayers, power outfits, all sizes of dusting machines are available. Growers who purchase horse-power spraying machines are urged to buy the latest and best makes. Excellent machines, both fifty and 100 gallons' capacity, are on the market. These machines may be used at about seventy-five pounds' pressure during the bug season and at 100 to 125 pounds' pressure during the late summer spraying against blight.

Good nozzles are necessary. The large plates or caps on nozzles should be used during the bug season to insure a heavy rate of application of poison per acre. Watch the nozzles and see that all parts of the vines are covered with poison.

More than a billion dollars' worth of barnyard refuse is wasted in the United States annually according to Carl Vrooman, assistant secretary of agriculture. "This is the prize waste of champion wastes of the world, the world's greatest preventable leak," Mr. Vrooman said. "At this time such a waste as this is a national tragedy. In peace times the waste would be bad enough, but with the solemn duty of saving the world from famine upon us, the need for the economy of this national resource ought to be apparent to everyone. Here is a thought for the American farmer which ought to challange his patriotism. It is not simply a colossal war measure. It is a measure which, if put into practice, will permanently benefit American agriculture."

SIMPLE GAS ENGINES

3, 5 and 6 Horse Power

THE FAMOUS KEROSENE-GASOLINE ENGINES

Its name tells the story. The cut shows the proof and a trial will convince you. The most modern engine for all purposes, **because,** they require no cranking, are easier to operate, lighter in weight, have more power, are absolutely dependable. Built of the highest grade material. The first cost is less, the upkeep is almost nothing. Investigate before you buy. Send for circular.

SIMPLE GAS ENGINE CO. **MENASHA, WIS.**

THE FARMERS' MARKET

WANTED—FOR SALE—TO EXCHANGE

THIS department is to bring the buyer and the seller together. You may want help. You may have live stock, poultry and eggs, or machinery for sale. Maybe you want to sell or to buy a farm. Think how you can advertise now. Write your copy for the advertisement. The rate is six cents per word, each insertion. Note the low cost to reach our 90,000 circulation.

THE WISCONSIN FARMER -:- MADISON, WIS.

COWS FOR SALE.

FOR SALE OR EXCHANGE for good cows, heifers, land, sheep or steers, a handsome seal brown registered Percheron stud, three years old this spring. 11-inch bone below knee, 2 feet 4 inches above knee, girths 7½ feet. Archie H. Cook, Baraboo, Wis.

I HAVE FOR SALE a large assortment of choice tubercular tested cows, all due to freshen soon. You can buy one or a carload. John Blanchard, Columbus, Wis.

BABY CHICKS.

BABY CHICKS—Standard bred S. C. White Leghorns for July 10th delivery, $9 per 100. S. C. Brown Leghorns July 17th. Safe arrival guaranteed. Catalog free. Order from ad and save time. Wolverine Hatchery, Zeeland, Mich.

CALVES WANTED.

CHOICE HIGH-GRADE Holsteins, Guernseys and Short-horn calves. A few select ones at $15 to $35 each, expressed at little cost. Write Ed. Howey Co., South St. Paul, Minn.

MILKING MACHINE FOR SALE.

FOR SALE—Milking Machine. Two-cow unit. Automatic vacuum and natural air pressure type. In first-class condition. Address W. M. Smith, 5305 Cornell Ave., Chicago, Ill.

TELEGRAPHY.

LEARN TELEGRAPHY—Positions guaranteed. Northwestern Telegraph School, Eau Claire, Wis.

FARM LANDS.

ALABAMA ALFALFA LANDS—Beautiful rolling prairie country, well drained naturally, health conditions very good, ample timber and shade, overflowing artesian wells of pure water, 50 inches annual rainfall, ideal climate, mild winters. Alfalfa grows without liming or inoculation, stays green all year, grazed December to March with cattle, sheep and hogs, cut for hay 4 to 6 times in season, variety native grasses and several clovers growing wild. Soil rich in lime makes best production of live stock. We are tick free. Dairying very profitable. Labor cheap and plenty of it. Creamery here paying Elgin prices and better for butter fat. Buy here where so many farmers and breeders from 11 different states have bought and making good; 30,000 acres for sale; any size farm wanted, terms reasonable, land cheap considering fertility and quality of soil. Good railroad facilities, several pike roads and more building. Corn, wheat, oats, velvet beans and many other crops grown here. Full information and photographs upon request. C. C. Clay Alfalfa Land Co., Demopolis, Ala.

NORTH DAKOTA in per capita and farm production surpasses every other state. As many dollars per acre can be produced as in states where land sells four times as high. Government records prove it. Climate, soil, crop, railroads, schools, roads exactly as good as best in Illinois, Iowa and Minnesota. The Soo Line wants practical, diversifying farmers. You can obtain a home without commission to us while land is still cheap; easy terms. Write at once for our plan of direct dealing. J. S. Murphy, Immigration Agent, Soo Line Ry., 1272 Soo Bldg., Minneapolis, Minn.

LOW-PRICED CUT-OVER LAND from our company, the owners, direct to you and on terms to suit, in this ideal dairy country. You should see Rusk county before you locate, because nowhere else will the same money locate you so favorably, with every advantage, schools, churches, railways, good markets near, and crops sure. Our company wants you to locate on its lands and will treat you right. Address Flambeau River Lumber Co., Station D, Ladysmith, Wisconsin.

SILENT PARTNER WANTED—We have a fine chance to buy fine farms close to the city of Oconto, Wis., suitable for stock farms, that would feed over a thousand head of cattle, at a very low price on account of old age and death of owners. There are over 100 head of thoroughbreds on them now that would go with the farm. There is big money for the party that would furnish the money to swing the deal. Address C. S. Hart, Oconto, Wisconsin.

RUSK AND SAWYER COUNTIES—We own 20,000 acres of good land and four townsites on the Soo and Omaha lines. Forties, eighties, etc. $15 to $25 per acre on very easy terms. All high land, plenty of hardwood timber and best clay loam soil. Excellent openings for saw mills and wood-working factories. Write for literature. Upper Wisconsin Land Co., Ladysmith, Wis.

FARM AUCTION SALE—The 440-acre dairy farm belonging to the estate of Moses Kaufmann, will be sold at auction July 18, 1917; 4 miles from the metropolis of South Dakota and a fine market. Easy payments, 15 years' time; 5½% interest. For further particulars write to Jones & Matthews, attorneys for estate, Sioux Falls, S. D.

NO PAYMENTS FOR FIVE YEARS—Only taxes and interest; $1.00 per acre down, balance on or before ten years; hardwood timber land with timber enough to pay for the land, close to market, schools and cheese factories; clay loam soil, all tillable. Taylor county, the clover and dairy belt of Wisconsin. Rib River Land Co., Medford, Wis.

BURLEIGH COUNTY, N. D., improved and unimproved lands $20 to $35 per acre. Aurora County, S. D., improved farms $43 to $60 per acre, sold on very easy terms. A. H. Schroeder, Mankato, Minn.

668-ACRE IMPROVED STOCK FARM, Polk Co., Wis.; good buildings, fences, living water; small payments, easy terms, low interest. Write for description. Mason Booth, owner, Merchants' Hotel, St. Paul, Minn.

520 ACRES—4 miles from Ladysmith; $10 per acre, ten years' time. Armstrong Land Co., Ladysmith, Wis.

BUSINESS CHANCES.

FREE for six months—My special offer to introduce my magazine, "Investing for Profit." It is worth $10 a copy to anyone who has not acquired sufficient money to provide necessities and comforts for self and loved ones. It shows how to become richer, quickly and honestly. Investing for Profits is the only progressive financial journal and has the largest circulation in America. It shows how $100 grows to $2,200; write now and I'll send it six months free. H. L. Barber, 509-28 W. Jackson Boulevard, Chicago.

HELP WANTED.

WANTED AT ONCE—Three men to work on poultry farm. Must thoroughly understand either incubation and brooding, feeding or health and sanitation. Are willing to pay good wages to the right man. Address Oak Dale Farm, Austin, Minn.

MONEY TO LOAN.

MONEY to loan on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage. 6% with privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

REGISTERED HOLSTEIN BULL.

REGISTERED HOLSTEIN BULL ready for service; 2 of his dams averaged 100 lbs. milk in 1 day and 35 lbs. butter in 7 days, officially; $100. Wisconsin Live Stock Association, Appleton, Wis.

POULTRY AND PET STOCK.

FOR SALE---S. C. RHODE ISLAND REDS

GOOD BREEDERS from exhibition and trapnested laying stock. Write for prices. **WINNEBAGO POULTRY YARDS, A. J. Schloerb, Mgr., R. 23, Omro, Wis.**

BARRED PLYMOUTH ROCKS and Buff Orpington ducks; Chicago winners; great layers; established 1892, eggs for hatching: $1.50, 15; $4.50, 50; $8, 100; prompt delivery and good hatch guaranteed. G. Earl Hoover, R. 24, Matthews, Ind.

HATCHING EGGS; prize-winning S. C. Reds, White Wyandottes, Buff Orpingtons, S. C. White and Brown Leghorns, $1.50 per 15. Ledge View Poultry Farms, Box W. F., Fond du Lac, Wis.

HATCHING EGGS—S. C. Reds, prize-winners all leading shows. Eggs, $1.50, 15; $8, 100. Order from this ad. Address C. L. Pre-Fontaine, Box 600, Fond du Lac, Wisconsin.

RHODE ISLAND REDS—Setting of 15 eggs from pure-bred prize-winning Rhode Island Reds, $2 per setting; three settings for $5. Hildebrandt & Vea, Stoughton, Wis.

CURRENT EVENTS

THE first detachment of United States soldiers landed on French soil last week, preparatory to going into action at the front under command of General Pershing. It has not been announced how many soldiers were landed, but the number runs into the thousands. Some 2,500 marines were included in the first landing. The troops left the United States without any public announcement and made their way in safety across the ocean and through the zone where the German submarines do their deadly work. The transports were convoyed by American battleships. The troops were given a wildly enthusiastic reception by the French, who look to the United States to save them in their plight, the French resources being almost exhausted. Other troops will follow from time to time and the National Guard regiments will probably reach France some time this fall, with the first detachment of the conscript army to follow early next spring. Considering the difficulty of mobilizing, of securing all the necessary provisions and equipments and the distance to be traversed the rushing of troops to France was done in record time and was a brilliant achievement. The American forces will be a net gain to the allies. It will throw no single burden of supply or equipment upon them. The troops will be fed, clothed, armed and equipped by the United States. Around them at the camp on French soil tonight are being stored supplies that will keep them going for months, and more will follow. General Pershing and his staff have been busy for days preparing for the arrival of the men. Despite the enormous difficulties of unpreparedness and submarine dangers that faced them, the plans of the army general staff have gone through with clocklike precision. Most of the first American troops to land had seen service in Mexico recently and are in splendid physical condition, anxious to get into the trenches and the fray.

THE administration food control bill, giving the president broad authority to control the distribution of food and fuel for war purposes, passed the lower house of congress by the decisive vote of 365 to five. Attached to it was a prohibition measure which forbids the use of foodstuffs for the manufacture of alcoholic beverages and gives to the president the authority to take over for war purposes all liquors now on hand. The amendment designed to cut off manufacture of liquors was adopted, 132 to 114. It was submitted by Representative Barkley, of Kentucky, democrat, and would provide that no food, food material, or feed could be used during the war for the manufacture of alcohol or alcoholic beverages except for governmental, industrial, scientific, medicinal or sacramental purposes. On the amendment authorizing government use of distilled spirits there was no roll call, and only a few scattered nays were heard on the viva voce vote. The United States is in a fair way to follow the lead of Russia, England and France and adopt strict prohibition measures during the war. Russia was the first of the great powers to take this summary action, but it was not long until the other nations followed suit. The United States is seriously considering the matter and congress will probably give the president all the authority needed to cut off the liquor traffic completely, if he sees best to do so. The agricultural committee of the senate has gone even further than the house and provides for a "bone dry" nation at the will and order of the president, beer and whisky to be absolutely prohibited.

THE $2,000,000,000 issuance of Liberty Bonds by the United States government was oversubscribed 50 per cent. The total subscriptions amount to $3,035,226,850. More than 4,000,000 people bought bonds. Ninety-three per cent of subscriptions or those of 3,960,000 persons were for sums varying from $50 to $10,000, while twenty-one subscribers applied for allotments of $5,000,000 each or more. The New York federal reserve district led the list with subscriptions totaling $1,186,788,400, or more than three times the amount subscribed in the next district, Chicago, $357,195,950. The other districts sent subscriptions as follows: Boston, $332,447,600; Cleveland, $286,148,700; Philadelphia, $238,309,250; San Francisco, $175,623,900; Richmond, $109,737,100; Kansas City $91,758,850; St. Louis, $86,134,700; Minneapolis, $70,255,500; Atlanta, $57,787,550; Dallas, $48,948,350. On account of the oversubscription those who subscribed in amounts larger than $10,000 will receive only a portion of the bonds they ordered, but all who subscribed for bonds in amounts less than $10,000 will receive all they ordered. The bonds are now being printed and will be ready for distribution to the subscribers about the first of August. The wonderful response of the American public was complete proof of the fact that the nation is behind the president and is ready to fight with men, money and munitions, to the end that tyranny and oppression may be banished from the earth.

SOMETHING like $105,000,000 was raised for the Red Cross in the nation-wide drive which ended last week. Practically every state contributed its quota, while some went far above the mark. Nothing has brought the war nearer home to the individual than this Red Cross drive, with its stories of bravery and suffering and its national appeal for aid. The rural districts contributed generously and the nation responded to the cry for help with wonderful spontaneity. The money raised is sufficient to carry on the work of the war relief for perhaps half a year, after which it will be necessary to come to the people again for funds.

ASSURANCES have been given the United States that Russia will not conclude a separate peace with Germany and that it is in the war to stay. These assurances were given in a speech before congress delivered by Special Ambassador Bakhmetieff, head of the Russian war mission to this country. "With all emphasis," said the ambassador, "may I state that Russia rejects any idea of a separate peace. What Russia is aiming at is the establishment of a firm and lasting peace between democratic nations. The triumph of German autocracy would render such a peace impossible. Russia will not fail to be a worthy partner in the league of honor." No previous incident of the war has stirred the senate and house to such enthusiasm. Senators and representatives who had restrained their applause at the appearance of Marshall Joffre and Foreign Secretary Balfour threw away all reserve and cheered the Russian envoy to the echo.

MILITARY Germany long ago introduced a card catalog for men and live stock. Every man and every horse and beast of burden was examined in peace time to determine suitability for military service and was indexed so as to be available. The system is now about to be extended to agricultural food products and applied to the harvest of 1917. Orders have been issued at Berlin to begin the giant card catalog in which all grains on the stalk, potatoes in the ground, fruit on the trees and other products will be entered, together with details of acreage, the number of individuals and live stock on each farm and the amount of food and fodder the farmer is entitled to retain for all purposes. This will be followed by regular reports through all stages of growth, harvest and delivery through the hands of the wholesaler, the miller and the retailer to the ultimate consumer. The reports will be checked up when considered necessary by a test of threshing and examinations. The system is introduced at the instances of the Prussian food commissioner, Doctor Michaelis, not only for the purpose of furnishing the government with information on the food supply and to avoid erroneous estimates such as proved nearly catastrophic this spring, but also to prevent the farmer from feeding grain and potatoes counted upon as rations for the people, to his cattle and other animals.

AN appeal to women to reduce by one-third the amount of wheat they use for the family was made by Joseph P. Griffin, president of the Chicago Board of Trade, to the woman's committe of the national council of defense. "We Americans normally use for food and seed 640,000,000 bushels of wheat annually," he said. "This year there will be but 650,000,000 bushels of wheat compared with 3,000,000,000 bushels of corn. That leaves but 10,000,000 bushels of wheat to send to the allies, and that's not bearing near our share of the burden. Every housewife in the United States can give up one-third of the amount of wheat she ordinarily uses. There is no end of wholesome nutritious corn products and by using these she saves not only one-third in the price of grain, but gets a much larger proportion of energy-producing nourishment and of fat."

MORE than 500,000 men have volunteered in the American army and navy in the period of less than three months that has elapsed since war was declared to exist. The army, navy and national guard represented an aggregate strength of little more than 300,000 men when the war resolution was adopted. Today between 700,000 and 800,000 are enrolled in the various branches of the fighting service and the great majority of them are armed, equipped and under training. They wlil be joined at the end of the summer by nearly 1,000,000 men selected for the new national army from the millions registered for war duty June 5th. The regular army totaled a little more than 100,000 men three months ago. It is nearing the 250,000 mark today and war department officials, backed by the press of the country, are bending every effort to bring it up to 300,000.

PLANS for insuring the lives of American soldiers and sailors during the war will be discussed at a conference of life insurance presidents with Secretary McAdoo, of the treasury department. One idea suggested is to place the insurance in the hands of the federal war risk insurance bureau, which is now insuring lives of men of the merchant marine. Another plan to be considered is a combination of insurance companies, coöperating with, or backed by the government.

TOP DRESS CROPS NOW!

MANURE MEANS MORE PROFITS!

Turn That Manure Crop Into Gold—Cash at Harvest Time—Farm Products Will Be Just as High This Fall!

Right now—this summer—is the time to top dress your crops. Get that big manure pile out on the land where every load spread means many more dollars for you in the great fall harvest. Spread your manure crop on your next year's corn land. Put a golden manure dressing over your winter wheat. Cover your valuable oats and make them still more valuable. Every pile of manure is in reality a pile of gold. Farm products are going higher and higher in price. The bigger and better your crop—the bigger and better your profits.

Farm Renters—Look Here! The present high prices and higher ones that are coming mean that you cannot afford to let your manure lie around your farm idle. Make it work for you. Make it produce more of the valuable farm products that are commanding such good prices today.

Spread Manure the Galloway Way

Stop the hard, wasteful hand method of spreading. Quit using that old makeshift, half broken spreader. Get Galloway's famous No. 8 Low Down or any Galloway Model direct from our immense factories and save $25 to $50.

Get Galloway's New Model Big Crop Spreader

Let me prove that in buying this great late model spreader direct from Galloway you not only save that $25 to $50, but you get the best spreader that I or any one else ever built. It's impossible to get as good a spreader as Galloway's, because I studied and investigated them all before I built my newest model. None has so light a draft—such a big horse saver. And best of all I have eleven new exclusive spreader improvements. These eleven new features are patented and controlled by me. On no other spreader can these eleven improvements be had. So if you want the newest and best in a spreader—the most down-to-the-minute in design, efficiency and work—your choice must be the Galloway.

See How I Have Improved the Spreader

Learn about my new steel beater and wide spreading V-rake that pulverizes and tears the manure to shreds. See my incomparable patented roller-feed that works on the same principle as moving a house on rollers. This together with the large drive sprockets make the lightest draft ever known. Remember my new model spreaders are not horse killers. The Galloway positively is easier handled with two horses than other spreaders with three and four horses. My patented automatic stop and uniform clean-out push board make spreading easier and more thorough than with old style spreaders. The everlasting tongue of pressed steel is positively indestructible. The beater teeth are strong and extra durable and break up the toughest clumps into finest particles. The rear shaft of high carbon steel is now stronger than ever. All metal parts neatly finished with asphaltum weatherproof paint. Spreader is adjustable from 4 to 24 loads per acre. Has double chain drive direct from rear wheels. Extra heavy bolts hold the beater bars in beater head. Beater bracket is strengthened beyond strength required by extra bolts. Part for part, all the way through from front to rear, the Galloway Spreader excells at every point.

Get My Low Patriotic Price!

This of all times is the time to use a spreader. A top dressing now means bigger crops this fall when prices will be higher than ever. And then all farm products will be at a premium. The men and the women on the farm must do their share for the nation. I am doing mine by naming you a low Patriotic Price that will help you in doing your bit for the country. It means

A Clear Saving of $25 to $50 for You

You get the Galloway direct from your field to your farm. Remember Galloway is not a dealer, jobber or agent, but the manufacturer—the maker—with a tremendous chain of factories at Waterloo, where he turns out hundreds of spreaders, Separators, Engines, Tractors and other implements on only one small maker's profit. This difference in price in buying direct from me you save and you can have any easy terms to suit. Choice of 5 buying plans.

Write for the Free Book tonight!

I Want You to READ THIS FREE BOOK That tells the whole story of my direct-to-you plan of buying and how I save you so much on such a wonderful Spreader. My book explains everything and shows you how my spreader on your farm will actually pay for itself in one short season by increasing your crop profits. So get the book and read it—every word—Mail this coupon now.

Roller Feed—V-Rake—Light Draft Steel Tongue.

Mail Me This Coupon Right Now!

Let me place in your hands the most valuable money-saving book ever given to the farmers of this country. It gives you full details of this remarkable spreader bargain and how I actually save you $25 to $50 on the highest grade spreader built. Don't confuse the genuine Galloway with cheap imitations made to meet my price. No other spreader can have the honest Galloway quality and the exclusive Galloway patented features. Here's proof:

Geo. A. Kralik, Oklahoma City, Okla., says, "I saved $29 on a Galloway. I know it is better than I could have bought here for $125.00."

Spreaders are shipped from place nearest your station, St. Paul, Chicago, Kansas City, Council Bluffs or Waterloo factories. Write tonight. Use the Coupon.

Fly Time and Milk Production.

An unbelievable amount of money is lost each year by the dairymen of Wisconsin because of flies.

That the keeping of flies along with dairy cows is expensive can be determined by anyone who cares to investigate.

If a herd will drop in production anywhere from 5 to 20 per cent with the coming of "fly time," and this at the season when production should be most abundant and economical, it should be apparent to all that flies collect or cause heavy tax.

That we are troubled less by this pest than in some less favored sections is cause for congratulation, but we should not, and need not, be satisfied with conditions as they are. In fact, there is still less excuse for our neglect of a matter which in many cases means the difference between profit and loss in summer dairying.

The cow is the most important part of the dairy department. The more or less expensive buildings and fittings we buy on her account are to assist her in the production of milk and butter fat, to extend her period of usefulness and to reduce the labor necessary to her care.

In brief, all this outlay of cash is to make the keeping of these cows more profitable. We invest dollars hoping to some day see them return accompanied by others of their kind. This is all well and good, but don't blame the cow if she cannot give milk and fight flies at the same time. The latter is not her job. That is yours if we will persist in breeding the "pesky" things.

Flies are pests, no matter how you consider them. The poor esteem in which they are held is indicated by the general slogan, "Swat the fly." It is a good one, too, and should be obeyed early and often.

We have all seen, however, that flies are less prevalent on some farms than on others. Of course, there must be a reason for this. If their presence is due to some cause which can be removed, then flies need not be present in such numbers as to be a plague.

The fact is that flies are most troublesome on farms where the least care is taken in the disposal of waste material and they find least encouragement on premises where the strictest cleanliness is the rule. The favorite hatching place of the fly is the fresh manure pile and it swarms about wherever animal or vegetable matter is left to decompose.

The best control is prevention. The best time to "swat the fly" is before he becomes one. Therefore, remove their breeding places, which are manure piles or refuse dumps. Clean up any spots where they may congregate, and destroy eggs or larvae. By so doing the nuisance is attacked at its source, which is always the effective way of handling such a problem and other precautions for protecting live stock from annoyance have some chance of accomplishing the desired end.

"Swat" the manure pile and thus effectively swat the fly. Perhaps we have overemphasized the value of the manure pile. If so it is not intentional, for it is the manure and not the pile that is worth saving.

The more direct the course of the manure from the stable to the land the better, for the valuable elements are then fixed in the soil where they are needed instead of being wasted through leaching or fermentation. The manure pile is an eater of fertility and a breeder of flies. Either is cause enough for its removal. Any dairyman would consider himself outraged if required to pay a license fee of $25 to $50 for maintaining a manure pile on his premises for purposes of ornament. True, still he would not have to be the owner of many cows before he would lose that much through wasted fertilizer and increased flies.—[Roy T. Harris, Wisconsin Bankers' Farm Bulletin.

Dr. Babcock Honored.

Dr. Stephen Moulton Babcock, inventor of the Babcock test and one of the foremost men in Wisconsin's dairy history, was honored by the University of Wisconsin during the graduation exercises of the school on June 20th for the great work which he has done in the interest of the state and the university. Dr. Babcock's work along scientific lines stands out preeminently and it is both proper and timely that the school where he has spent so many years of his life and where he has worked so unselfishly and untiringly should confer upon him the degree of doctor of science. The 6,000 persons that crowded the live stock pavilion during the exercises applauded the doctor in a manner which left no doubt as to his popularity.

The university also honored Paul S. Reinsch, United States minister to China, by conferring upon him the degree of doctor of laws. Mr. Rinsch graduated from the University of Wisconsin in 1892.

Mrs. Mary F. Bradford, superintendent of schools at Kenosha and formerly president of the Wisconsin Teachers' Association, was honored with the degree of master of arts.

The total graduation from the university this year numbered approximately 1,000.

Dairy Cattle Congress.

The eighth annual Dairy Cattle Congress will be held at Waterloo, October 1st to 7th. The show this year will undoubtedly be one of the largest in the history of dairy experience in the West. As usual opportunity is offered to buyers to choose good breeding stock. While most of the cattle will not be for sale, breeders will have an opportunity to determine, in a general way, the best types of the several breeds. Exhibition space for machinery, dairy supplies and equipment, etc., is being reserved by manufacturers as usual. Dairy cattle congress is for all dairymen, creamerymen and farmers. Its prize money is open to all breeders in the world.

Eau Claire County Holstein Breeders.

The Eau Claire County, Wisconsin, Holstein-Friesian Breeders' Association held its annual picnic at the George B. McLellan farm, ten miles southwest of Augusta and a mile east of Foster. The day was ideal and visitors came for twenty miles around. Roads are good in this neighborhood and care plentiful. A picnic dinner was served at noon, at which the association furnished free coffee, cream, sugar, ice cream, cups and plates, and those who attended brought the balance of their dinner. The tables were heavily laden. D. S. Bullock, of Madison, gave a very interesting talk on keeping herd records and Mr. Ingalls, our county agent, gave a splendid talk on "The Value of Belonging to an Association." The program included solos by Miss Flo West and Eldredge Hubbard. The 300 people who attended this picnic spent a very enjoyable and profitable day.

Langlade County Guernsey Breeders.

Langlade county Guernsey breeders made history for their association in a ninety-mile auto trip to Wausau and vicinity on June 12th. Nine automobiles loaded with Guernsey enthusiasts of the county enjoyed the outing.

Visits were made to the Marathon County Agricultural School and to three of the leading Guernsey herds of Marathon county near Wausau. At each farm Mr. Math Michels, of Peebles, guest of honor of the day, gave short talks on various phases of the Guernsey industry. Owners or herdsmen explained their methods of management. County Representative cow, a yearling and a calf. Son number three has a yearling. Four younger sons haven't yet attained the A. C. Humphrey, of Marathon county, acted as pilot for the party while in his county. Mr. Humphrey also gave a most interesting talk on the "Points of the Dairy Cow."

At Lily Dale Farm the proprietor explained how he had built up his herd of thirty-five head from one pure-bred heifer calf purchased thirteen years ago. Mr. Bandy always made it a point to purchase high-class, pure-bred sires. He related with deserving pride his plan of taking his boys into partnership. When a boy obtains the age of about twenty Mr. Bandy gives him a heifer calf, which, with its offspring, becomes the permanent property of the boy. His oldest boy now owns four head besides having sold $300 worth of bulls. The second son has a age when according to dad's plan they are entitled to a calf of their own. "But all are interested in Guernseys," declared Mr. Bandy.

Heartily endorsing Mr. Bandy's plan, Mr. Michels told how he has lined up his boys in much the same way. He starts them at sixteen. On the Michels farm about a third of the fifty head of pure breds are owned by the boys. "I tell you there is nothing like it to rouse a boy's interest in stock," declared Mr. Michels. "My boys are not only more interested in their own Guernseys but in mine as well. They are perfectly satisfied to stay on the farm." "That watering system cost me just $45 and I can't see how any northern Wisconsin farmer can afford to be without one," said Mr. Bandy, when questioned as to his opinion of the value of an inside watering device. His supply tank is of concrete, built in one side of the feed room between the silo and the barn. The cups and controlling device are the output of a well-known barn equipment firm. He did the work himself.

The contribution of northern Wisconsin's luxuriant pastures to the size and capacity and vigor of the Guernsey was well exemplified in both the Walter Alexander and B. T. Wilson herds. Not a delicate specimen in the whole lot on either farm.

For the man who delights in a cow with long, deep, roomy middle, coupled with a frame and constitution to match, these cows were a sight to behold. Real cows for size, every one of them. To the man who would switch from the Guernsey to a cow of larger size and conformation, these cows were a warning "to don't."

On the Wilson farm Lady McLean, grand champion Guernsey at the 1915 state fair, was led out for inspection. This beautiful specimen of the breed proved an inspiration for the Langlade county breeders. Using her as a test Mr. Humphrey most ably presented the points of the ideal dairy cow. Guernsey interest is growing rapidly in Langlade county. Since January 1st six farmers who did not previously own one have purchased pure-bred sires. Two other farmers bought exceptionally high-class sires from well-known Guernsey herds in the southern part of the state. Several farmers are planning the purchase of pure-bred Guernsey heifers at an early date.

Officers of the Langlade County Guernsey Breeders' Association are: President, Gustave Schroeder; vice

Kalamazoo ALFALFA & ENSILAGE CUTTERS

Before you buy an ensilage cutter, find out all about the *Kalamazoo*—the *only* cutter on the market having a center shear. The Kalamazoo has an unbreakable malleable knife *wheel*—not a knife cylinder. Two knives are constantly cutting toward *center*—absolutely no side-thrust. No wasted power. This center-cutting knife wheel delivers a steady, even flow of ensilage to the blower—clogging is absolutely impossible. Another big feature—

The Knife Wheel is the Blower Fan

You can't realize what a power saving this means until you see a Kalamazoo in operation. All wearing parts are easily adjustable. Cutting adjustment is on shear bar only. This makes adjustment of knives simple and easy compared with other cutters.

Get a Kalamazoo—save power—save cutting cost—feed your herd on less acreage. "Do your bit" by helping produce America's biggest saleable crop.

Fond du Lac County Holstein Breeders.

The annual summer meeting and picnic of the Fond du Lac county Holstein-Friesian Breeders' Association was held at the C. H. Brugger farm, June 15th. Sec. J. J. Ermatinger, of the Fond du Lac Association of Commerce, announced the desire of his organization to promote in any possible way the dair cattle interests of the county. He asked the breeders to furnish him with cattle which they have for sale so that he could pass this information to visitors coming to Fond du Lac county for good stuff. In this way buyers may be able to find out in town where they can get hold of a carload of stock. This is a splendid plan of coöperation that might well be adopted in every place. It would certainly be very handy for buyers to find out in town in just what part of the county they could secure the stock they desired. A good many visitors to the city are accompanied by bankers and these men have the habit of getting acquainted in the cities and towns before going to the country. The Fond du Lac Association of Commerce looks upon the development of the country surrounding Fond du Lac as of great importance and has offered to assist in many ways in this work. Mr. Brugger has a fine modern bungalow on his place, built of split hardheads, and he also has a fine modern dairy barn. This farm proved an ideal place for the gathering and everyone enjoyed the day immensely.

Barron County Holstein Meeting.

The annual summer meeting and picnic of the Barron County Holstein Breeders' Association was held at Krahenbuhl Grove, Saturday, June 16th. The chief address was given by W. F. Schilling, who gave a splendid talk, reviewing at some length the progress of the Holstein breed in the country and in Barron county, as compared with ten years ago. The older dairymen present participated in a judging contest for the best dairy cows and the boys and young men judged the calves. It was a big day for the Holstein interests of the county.

Club Studies Dairying.

To the Editor:—Our club has been having a good time the past year. We are interested in debating in general discussion on farm topics and also have dancing and singing. Dairying is the leading subject. We have done some community breeding and erected a coöperative creamery (not entirely on account of the club, however) and just now the club is discussing the extension of our creamery coöperation so as to enable us to deliver milk to the city trade. We feel that we might be able to make arrangements to handle milk orders from consumers. We have several young men in our club who have taken a course at Madison and can discuss farm topics very well. This region is rapidly developing in dairying. The pastures during the summer months are good. Clover grows luxuriantly, and, owing to the cool, moist climate, remains good until late in the fall. All kinds of grain and crops are doing well here in Douglas county. We are glad to see The Wisconsin Farmer taking an interest in clubs. J. F. Kirwin.

South Superior Farmers' Club, Douglas county, Wis.

Eau Claire-Dunn County Guernsey Breeders.

To the Editor:—The Eau Claire County Guernsey Breeders' Association held its annual summer picnic June 13th, in connection with the meeting of the Dunn county association. The scene of this picnic was "Atlasta Farm," the beautiful place owned by C. T. Bundy, near Cedar Falls, Dunn county. Mr. Bundy's herd consists of fifty pure-bred Guernseys, a great many of which have already qualified for advanced registry, with very creditable records, and several others now on test are coming along in good shape with prospects of good records. The first heifer from Mr. Bundy's herd bull to be put on test has, during the first month, produced 62.6 pounds of butter fat. The visitors spent the forenoon admiring the stock and getting pointers to take back home and aid them in improving their own herds. There was a basket luncheon at noon followed by judging of dairy cows. Mr. Klatt was awarded first prize and Joe Cramer second. Professor Wolf, of the Dunn County Agricultural School, gave a talk, followed by Mr. Hills, of Peterboro, New Hampshire, who presented greetings from the home office of the American Guernsey Cattle Club. He spoke very emphatically of the duty of the breeders of the middle West, who are expected to do everything in their power to increase the number of dairy cattle, in order to supply the demand which is coming surely from the eastern markets when the farmers and dairymen there are obliged to sell off at least a part of their cattle because of shortage of feed. Prof. G. R. Ingalls, our county agent, gave us a fine talk. Mr. Bundy explained the change made in the rules for conducting advanced registry tests, as adopted at the last session of the American Guernsey Cattle Club. It was a big day for the Guernsey breeders of Eau Claire and Dunn counties, and the hospitality of Atlasta Farm was universally commended. W. W. Kinyon, Sec.

Eau Claire Co., Wisconsin.

Waukesha County Jersey Picnic.

The annual summer meeting of the Waukesha County Jersey Breeders' held at H. W. Claflin's farm, Muskego, Wisconsin, June 21st, was an event that furnished both pleasant and profitable recreation for a goodly number of Jersey enthusiasts as well as many broad-minded dairymen representing other dairy breeds.

Mr. and Mrs. Claflin have the happy faculty of making their guests feel at home and they are to be congratulated upon making the good spirit possible which prevailed throughout the meeting. Mr. Claflin has an excellent Jersey herd and the fact that there were some of the choicest specimens of the breed almost continually in sight of the meeting gave the event a distinct Jersey tone.

A particularly good list of speakers also had much to do in making this meeting a success. Prof. D. H. Otis, of the Wisconsin College of Agriculture, gave one of his substantial talks, in which he briefly pointed out the significance which the dairy cow is to play in the titanic struggle which is just ahead of us. The data Professor Otis gave regarding the present food supply of this country and the prospects for this year's crops as well as the efficiency of the dairy cow in converting raw materials into human food should encourage every farmer interested in the dairy business. Professor Otis also pointed out the great demand for dairy cattle that would be made upon this country after the war.

Mrs. Addie Howie, Elm Grove, recognized not only in Wisconsin but throughout the entire country as a leading exponent of the Jersey breed, championed the Jersey cause in an able manner and made the prophecy that the day was coming when, not only in Wisconsin, but wherever dairying reached a high state of perfection, the Jersey cow will be foremost.

Mrs. Howie pointed out the performance of Brown Bessie as well as members of her own herd that have demonstrated the possibilities of the Jersey cow. Mrs. Howie is not only a noted lecturer on dairy subjects but has made thousands of pounds of butter with her own hands which gives her hearers added respect for her opinions on matters pertaining to the future for the Jerseys. In accounting for the fact that Jerseys are not more prominent in Wisconsin than they are, Mrs. Howie laid the blame on the men behind her rather than the cow herself.

Rev. John Humphries, of Big Bond, gave an ardent address on patriotism that contained much food for serious thought and incidentally made a vigorous plea for national prohibition.

Mr. S. A. Baird mentioned the Gov. W. D. Hoard memorial fund that has been started, and suggested the part Wisconsin dairymen should take in this worthy movement.

Mrs. N. Kartach spoke on the Red Cross work which is claiming so much attention at present.

G. P. Jones, Waukesha county Y. M. C. A. worker and labor agent, outlined some of the splendid work they were endeavoring to accomplish.

Gavin McKerrow, a prominent Waukesha county Guernsey breeder, was called upon for a few remarks and he emphasized the importance and possibilities of a county breeders' association.

GROUP OF VISITORS AT WAUKESHA COUNTY JERSEY BREEDERS' PICNIC.

About 12,000 pounds of wool were sold by Gage county, Nebraska, farmers at a recent coöperative wool sale conducted in that county under the direction of L. Boyd Rist, the county agricultural agent. The average price received for the wool was 51 cents a pound, some farmers receiving as high as 55 cents. Buyers from Philadelphia, St. Joseph, Kansas City and Omaha attended the sale.

Ask your neighbor to subscribe for The Wisconsin Farmer.

HOT WEATHER

the season when a

DE LAVAL SEPARATOR

saves most over any other separator or skimming system

IT'S A GREAT MISTAKE for any dairy farmer without a separator or using an inferior machine to put off the purchase of a New De Laval Cream Separator in the summer months, especially with butter fat at the present unusually high price.

Great as are the advantages of the New De Laval over all other separators, as well as over any gravity setting system, at every season of the year, they are even greater during the mid-summer season than at any other time.

This is because hot weather conditions occasion greatest butter fat losses with gravity setting and render it most difficult to maintain quality of product with any gravity system or unsanitary separator, while, moreover, the quantity of milk is usually greatest, and any loss in either quantity or quality of product means more.

Then there is the great saving in time and labor with the simple, easy running, easily cleaned, large capacity New De Laval machines over all other methods or separators, which naturally counts for more at this time of the year.

Hence the great mistake of putting off the purchase of a New De Laval Cream Separator in summer, whether you already have a poor machine or none at all, and every dairy farmer should keep in mind not only that a De Laval will pay for itself in a few months, but may, if desired, be bought on such liberal terms as to actually save its own cost while being paid for.

Every claim thus made is subject to easy demonstration, and every De Laval local agent is glad of the opportunity to prove these claims to you, in your own dairy, without cost or obligation on your part.

Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for new catalog or any desired information.

Every New De Laval is equipped with a Bell Speed-Indicator

THE DE LAVAL SEPARATOR CO.

How to Destroy Bedbugs.

We have a letter from one of our subscribers who has just moved into an old house that is so badly infested with bedbugs that she is at a loss to know how to deal with them and she appeals to us for some method of eradication.

The commonest prescription for bedbugs is a mixture of one ounce of corrosive sublimate in a pint of alcohol, to which is sometimes added four ounces of turpentine. This liquid may be squirted by means of a small syringe into cracks around the beds, around mopboards, in back of picture frames or other hiding places where the bugs live. Gasoline or kerosene may similarly be used, in which case, because they are not corrosive, an ordinary spring-bottom oil can may be used for making the applications. Gasoline is especially penetrating and less liable to leave after odors than kerosene, and if used liberally enough will destroy eggs of the insects in the cracks where the bugs hide. When using gasoline, on account of its explosive nature, precautions should be taken with fire. Boiling water poured over infested bedsteads is sometimes recommended and would be serviceable if liberally used, but this treatment is harmful to varnish.

Since bedbugs breed in any cracks in the room, such as under wall paper, under mopboards or in the bedsteads, in which places they hide during the daytime, it is often impossible to reach all the places with a liquid treatment. Notwithstanding the inconvenience attending its use, under such conditions fumigation will be most effective. The room must be made as nearly gas tight as possible by stopping up keyholes and by pasting strips of paper over any openings. Sulphur may be burned at the rate of two pounds to every 1,000 cubic feet of room space. It should be placed on an iron plate, wet with a cupful of denatured alcohol and ignited, or sulphur candles may be substituted. The room should be kept closed for fourteen hours. Sulphur has the disadvantage of bleaching or tarnishing articles in the room

There is one other very efficient method of destroying bedbugs or any kind of vermin in the house, and that is by cyanide fumigation. This method is quite dangerous, however, and should be used only as a last resort. Because the gas produced is colorless and virtually odorless, the danger attending the use of cyanide is often not appreciated, and if it is carelessly employed might have as disastrous results on the people living in the house as on the bugs. When all other methods of eradicating the bugs fail and cyanide fumigation is demanded it may be carried out as follows:

For every 1,000 cubic feet use ten ounces of sodium cyanide mixture, a little less than a pint of sulphuric acid and a quart of water. The acid should be poured slowly into the water in an earthenware jar and the cyanide should be wrapped in a piece of paper. When the room is in readiness the paper of cyanide may be dropped into the acid and the room should then be immediately closed Even a slight inhalation of the evolved gas may have bad effects, so the greatest care in using the poisonous cyanide should by all means be exercised. Before the room is again to be entered it should be thoroughly aired from the outside.

An Inexpensive Meat Substitute.

Cottage cheese is one of the important meat substitutes, say specialists of the United States Department of Agriculture. It contains a larger percentage of protein (the chief material for body building) than most meats and furnishes this material at a lower cost. In every pound of cottage cheese there is about one-fifth of a pound of protein, nearly all of which is digestible. Meats, on the other hand, usually contain less protein and besides have a certain waste, such as bone and other inedible material. A pound of cottage cheese daily would supply all the protein required by the ordinary adult engaged in a sedentary occupation.

The following table shows that cottage cheese, obtainable at from 12 to 17 cents per pound, is much cheaper than most meats in furnishing protein for the diet.

For supplying protein, one pound of cottage cheese equals:

1.27 pounds	sirloin steak.
1.09 pounds	round steak.
1.37 pounds	chuck rib beef.
1.52 pounds	fowl.
1.46 pounds	fresh ham.
1.44 pounds	smoked ham.
1.58 pounds	loin pork chop.
1.31 pounds	hind leg of lamb.
1.37 pounds	breast of veal.

In addition to protein, energy for performing body work must be furnished by food. As a source of energy also cottage cheese is cheaper than most meats at present prices. The following table shows the comparison when energy is considered.

On the basis of energy supplied, one pound of cottage cheese equals:

8 1-3 ounces	sirloin steak.
11¼ ounces	round steak.
11¼ ounces	chuck rib beef.
10¾ ounces	fowl.
5½ ounces	fresh ham.
5 ounces	smoked ham.
6 ounces	loin pork chop.
7 1-3 ounces	hind leg of lamb.
12¾ ounces	breast of veal.

An Old Hand at Making Beads.

To the Editor:—I shall try to explain to Miss Loraine how to make rose beads. Gather the rose petals (any color will do) while the roses are in their prime, fully open, but not showing any signs of the petals falling off. The sweet smell of the beads comes from the fresh petals. Be careful not to get any pollen or leaves among the petals, because when ground and molded they will crack the beads because they do not give or dry.

When you have gathered a sufficient quantity of petals put them through a food grinder. Grind as many times as you have time for—the more times they are ground the finer will be the beads. I usually grind mine fourteen times. When they have been ground through the finest cutter of the grinder put in a sheet-iron pan, as an old black bread pan or an old stovepipe. The blacker the pan or tin the better the beads are and the blacker. Be sure the tin or pan is not rusty and do not use a tin pail or enameled pan. Spread the pulp lightly over the pan so as to get thoroughly black. Keep the pulp in a cool place, as in a cool cellar, for it must stay damp. Never keep it near the stove or in the sun. Turn and spread the pulp once a day and grind if desired, for it makes the beads finer grained. When ground be sure to return the oozing juice.

After three or four days the pulp has generally blackened through. The pulp must never get hard or moldy. If, when put into a ball, it is about as soft as putty it is about ready to mold into beads. If it should get too hard to mold, put a little glycerine or olive oil in it—just enough to moisten it. This helps to make the beads glossy also.

The beads should be made at least three-fourths larger than you want them to be when dry because they shrink in drying. In molding the beads place a small piece of pulp in the palm of your hand and roll with the fingers of your other hand. Be sure the beads are pertectly round and the same size, unless, of course, you wish larger beads at the bottom of the chain and smaller ones around the neck, which makes a pretty chain when strung.

When the beads are made stick a pin or needle through the center of each and put on a cracker board to dry. After ten to twenty days, or when hard, the beads may be strung. Keep them in a cool place away from the heat and sun while drying, otherwise they will crack.

When ready to string slip off the pin or needle and string first a rose bead and then a gold one. If the gold beads are small two or three may be used between the rose beads. The gold beads may be bought for from 10 cents to $3 a string.

Never let babies wear rose beads, because they are liable to eat them and it will make them very ill.

If you get tired making the beads stop and think of me, for I have made at least 750. You may think only city people have time to make rose beads, but, oh, no, for I am a country girl and have much to do besides.

Augusta M. Zebarth.

Grinds Rose Petals Nine Times.

To the Editor:—I want to tell Loraine how to make beads from rose petals. I take about a gallon of rose petals and grind them every morning for nine mornings through a food grinder. After the first grinding I put them in a rusty bucket and put rusty nails in with them. After the ninth grinding I make them into beads. When making the beads I rub a little vaseline on my hands to keep them from sticking. I put the beads on hat pins to dry and when they are perfectly dry I string them. They are black and are pretty with gold beads between them.

I wonder if anyone cans mulberries as I do. I use about one-third gooseberries or green grapes and one-third mulberries. Cook and can as you would any other fruit. They are fine for making pies. Bertha S.

Use Dark Petals For Rose Beads.

To the Editor:—I have read many of the letters which have been written to the Home department and I enjoy them. I will tell Loraine how to make rose beads.

Take a quantity of fresh rose petals, preferably the darker ones, clip the small "eye" from the base of the larger ones and pass through a food grinder three times, first using a coarse blade, then the finest. Return to the mass the water which has oozed from the pulp, spread on a sheet-iron pan and set in a cool place for a day. The next day repeat the grinding three times and again put away in the sheet iron pan. Continue in this way for five days until the mass, which has become darker, is perfectly smooth and pliable.

On the sixth day take bits of the paste and roll with the fingers into balls twice the desired size, as the beads shrink about half. If the paste is too dry to roll, moisten with water. If it breaks in the attempt to roll, run through the grinder again. Repeat the rolling the next three days. Before the balls become too hard pierce each with a hat pin and run them on pins, pressing each with a piece of heavy paper to make a perfect shape. Mark designs on the beads at this stage, using a small wire hairpin. When the hat pins are filled insert in a cushion and let them remain until the beads are thoroughly dry. Polish by rubbing with the palm of the hand moistened with vaseline or olive oil and let stand several days more. String on double waxed linen thread No. 36, with two or three small gold beads after each rose bead. Silver or iridescent beads also combine well with the rose beads.

Clara Martenson.

A simple and artistic centerpiece to put upon the dining table between meals may be made of cretonne. The size of the centerpiece depends somewhat upon the size of the table, but the usual thirty-six-inch diameter of the stock size will be suitable for the average table. The centerpiece is made of two circles of the same diameter, cut from cretonne. If the paper in the room is plain, a figured material repeating as its principal color the same as that on the walls will be in good taste. With a pattern paper a plain cretonne should be used. After the circles are cut, the edges are turned slightly in all around, and the two circles are sewed together on the edges with invisible stitches. To finish off, stitch on a large edge. Centerpieces can be made in this way to match any color scheme or to fit any table by cutting the foundation pieces the same shape as the table. If the same cretonne is used for curtains, candle shades and upholstery, very beautiful effects may be obtained in a room.

THE YOUNG FOLKS.

How "Uncle Sam" Was Named.

How many of the boys and girls know how the United States came to be known by the nickname "Uncle Sam?" Uncle Sam is doing so much for boys and girls, and grown-ups, too, all over the world just now that we ought at least to know how he got his name, don't you think?

During the war of 1812 a man by the name of Elbert Anderson was engaged in furnishing supplies for the army. His store yard was located at a small town on the Hudson river. All army supplies, of course, had to be examined by a government inspector. The supplies at Anderson's yard were inspected by a man named Samuel Wilson, who was familiarly known as "Uncle Sam," and, as each box or package was passed it was marked with the initials of the contractor Mr. Elbert Anderson, and of the United States, thus, "E. A.—U. S." The man who performed the duty of marking the boxes was asked what the letters meant and he replied that they stood for Elbert Anderson and "Uncle Sam." The story was told and printed and "Uncle Sam" the United States has remained ever since.

"Doctor."

Dear Young Folks:—I am a little girl ten years old. I am in the fifth grade at school. I also study music. I have a piano and can play several pretty pieces.

The pet I loved most of all was a little puppy that was given to me by our family doctor and I named him "Doctor." We made him a nice little box under the house and he slept in it every night. He was my constant playmate. After he grew larger he would bark at the dogs that passed. One morning a big hound jumped over the fence and began fighting Doctor and before we could stop him he had bitten him in a great many places. We learned afterwards that he bit a number of dogs and a boy, for he was mad. So we had to have poor Doctor killed.

Mildred.

Keeps House for Father

Dear Young Folks:—I have been a silent reader of your column for quite a while and would like to join if there is room for me.

I was reading your letters today and read the one signed "Lucile." She asked a riddle—What is it that we often return, but never borrow? The answer to it is "Thanks."

I have no mother. My mother died six years ago I am twelve years old and in the seventh grade. I keep house for my father and three brothers. I have two brothers and two sisters away from home. I raise chickens and garden. My two little brothers help me hoe in the garden.

Will some of you girls who have mothers ask them how long I should wear my dresses and if it is all right for me to go to parties if I go with my brother? I have no mother to fix my clothes and I don't know how, but I do all my own sewing. Vesta.

Joined a Garden Club.

Dear Young Folks:—I am a girl thirteen years of age. I go to school and am in the seventh grade

How many of the girls and boys have a garden this year? I have. I joined a garden club and planted a nice garden.

We live one mile from school. I love to go to school. I have one sister. My pets are a dog named Bounce, a cat named Tommy and a few bantam chickens. We have about fifty little ducks, too. I love country life very much

We have a kodak and we have fine times taking pictures. Bessie.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Inclose 10c for each pattern. Send 10c in silver or stamps for our up-to-date 1917 spring and summer catalog, containing over 550 designs of ladies', misses', and children's patterns, also some points for the needle. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

2134—A practical suit for the growing boy. Pattern is cut in 4 sizes: 4, 6, 8 and 10 years. Size 8 will require 3 yards of 36-inch material.

2142—A simple summer gown. Pattern is cut in 3 sizes: 16, 18 and 20 years. It requires for an 18-year size 6⅜ yards of 36-inch material.

Blouse 2148-Skirt 2157—A splendid combination for sports or outing. The blouse 2148 is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 2157 is cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. The skirt requires 3 yards of 44-inch material and the blouse 3¼ yards of 44-inch material for a medium size. Two separate patterns, 10 cents for each pattern.

1742—Girls' jumper dress, with guimpe having long or short sleeves. Pattern is cut in 5 sizes: 4, 6, 8, 10 and 12 years. It requires 1¾ yards of 27-inch material for the guimpe, and 2⅝ yards of 36-inch material for the dress, for an 8-year size.

2139—A practical and comfortable first set of short clothes. Pattern is cut in 5 sizes: 1, 2, 3, 4 and 5 years. The dress will require 2¼ yards of 36-inch material. The slip 1½ yards. The drawers 1¼ yards for a 4-year size.

2160—A pretty dress for the growing girl. Pattern is cut in 4 sizes: 8, 10, 12 and 14 years. It requires 2 yards of 36-inch material for the guimpe, and 4¼ yards for the dress, for a 10-year size.

1397—Girls' dress with sleeve in either of two lengths. Pattern is cut in 4 sizes: 2, 4, 6 and 8 years. It requires 3 yards of 44-inch material for a 6-year size.

1690—A dainty summer frock. Pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 8½ yards of 44-inch material for a 36-inch size.

2158—A practical, comfortable and popular undergarment. Pattern is cut in 4 sizes: Small, 32 and 34; medium, 36 and 38; large, 40 and 42, and extra large, 44 and 46 inches bust measure. Size medium requires 3¼ yards of 36-inch material.

1976—Ladies' skirt with yoke trimming. Pattern is cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. It requires 5¼ yards of 44-inch material for a 24-inch size.

2132—Ladies' "cover all" apron. Pattern is cut in 4 sizes: Small, 32 and 34; medium, 36 and 38; large, 40 and 42, and extra large, 44 and 46 inches bust measure. It requires 4⅞ yards of 36-inch material for a medium size.

1984—Ladies' house dress, with sleeve in either of two lengths. Pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 6¾ yards of 36-inch material for a 36-inch size.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for July 8, 1917.

Ahaz, the Faithless King.

LESSON TEXT—II Chron. 28:1-5, 20:27.

GOLDEN TEXT—Without faith it is impossible to please him.—Heb. 11:6.

LESSON TEXT—II Chron. 30:1-13.

Ahaz reigned sixteen years from about 739 to 723 B. C., over the kingdom of Judah its capital being in Jerusalem. The kingdom was nearing its end, and was destroyed within a few years after the death of Ahaz. His character presents many interesting questions for discussion; the character of his reign, the wealth and prosperity of his father and grandfather, the development of his character from the home wherein he originated, why a nation can be successful and not be righteous or virtuous, that is, outwardly successful, and the application of these questions to our present-day political and commercial lives.

I. Ahaz, the Ruler, (vv. 1-5). The character of Ahaz is not to be admired. He played a prominent and evil part in the history of the kingdom of Judah. We find his name recorded among the Syrian inscriptions of the year 732 B. C., the Hebrew historian having dropped the prefix "Jeho" from his name. The full name indicates that he had "grasped Jehovah," yet he was untrue to his name. The historian says "he did not that which was right in the sight of the Lord." This puts it mildly, but indeed few of the kings of Judah did otherwise, and he patterned his conduct not after the good model of his father, but the thoroughly bad conduct of the kings of the northern nation, Israel. He was but twenty years of age when he took the throne, but had already entered upon a course of action opposed to that of his father.

II. Ahaz Ruined. The choice lay before him of following in the steps of his grandfather, Uzziah, and his father, Jotham, (Chron. 1:10). He chose to defy God, openly disobeyed him and was disloyal to his God and his country, walking in the ways of the kings of Israel, (v. 2), burnt his children in the fire, after the abominations of the heathen, (v. 3) made molten images of Baal, (v. 2), and spread that worship into the high places on the hills and under every green tree (v. 4), made sacrilegious use of the temple's treasury and was dishonest as well as profane. He trusted Baalim more than he trusted God.

III. Ahaz Rebuked. God did not allow him to pursue his course of action without protest. When the children of good men go wrong, there is no measuring the extent of depravity to which they will sink. Nevertheless, God was opposed and tried to save the young man and the nation. God used the king of Syria as one agency for rebuking this mad young man. He carried away great multitudes captive, 120,000 in one day (v. 6), and "200,000 women, sons and daughters" (v. 8) at another date. Ahaz himself was filled with terror at the great calamity that overtook him. (Isa. 7:2.) While he received temporary help (II Kings 16:9, 10), he received ultimately ruin from the king of Assyria, for he became a vassal and was summoned to Damascus to pay homage to that king, as appears from the account II King's 16:7-9, and also from the Assyrian inscription, above referred to. Other enemies also attacked him—Edomites from the southeast carried away captives, and the Philistines from the southwest invaded the cities of the low plains, south of Judah, and took possession of them (vv. 17-19) and the army of the Assyrian, which Ahaz led to rob and profane the temple and its treasures in order to buy them off (v. 22-24), completed the ruin of his nation. Ahaz was forced to pay a heavy tribute to the Assyrian king (v. 21), and got no help for his outlay. He put his trust in an arm of flesh instead of in the mighty arm of God, which brought upon him the curse that always comes to those who trust in man (Jer. 17:5, 6). There is a blessing which always awaits those who trust in Jehovah (Jer. 17:7, 8). The wise man turns to God not in the time of his distress, but at all times. Instead of sacrificing to the God who saved his father and who would save him, Ahaz sacrificed to the god "which smote him." His defiance knew no bounds (v. 24). He seemed to have dabbled in every known form of false worship, thereby "provoking to anger the Lord God of his fathers" (II Kings 23:11 12). God is long-suffering to those who wander from him, but there comes an end to his patience (II Peter 3:9, 10).

IV. The Reverse Picture. There are several problems to be solved as we view this picture, for it is a story of real life, not only of the early times, but is being repeated even today and in this country. (1) Men will reap that which they sow. One cannot sow wild oats and reap the fruits of righteousness. (2) Jehovah places righteousness above security or prosperity. (3) God's purposes are for the uplift and the making of the nation and the individual better. God never does evil that good may come out of it. A loving father must exercise discipline, and let us not be mistaken.

Recipes.

Cottage Cheese Salad.—Mix thoroughly one pound of cottage cheese, one and one-half tablespoonfuls of cream, one tablespoonful of chopped parsley, and salt to taste. Fill a rectangular tin mold with cold water to chill and wet the surface, then line the bottom with waxed paper and pack the cheese in three layers, putting two or three parallel strips of pimento between the layers. Cover with waxed paper and set in a cool place until ready to serve, then run a knife around the sides and invert the mold. Cut in slices and serve on lettuce leaves with French dressing and wafers. Minced olives may be used instead of the parsley and chopped nuts also may be added.

Escalloped Tomatoes With Rice.—One cupful of rice, eight medium-sized tomatoes, two tablespoonfuls of sugar, two teaspoonfuls of salt, a little paprika, two tablespoonfuls of butter, buttered crumbs. Brush a casserole or an earthen dish with butter, and put in half of the rice, which has been boiled and blanched as usual. Put in a layer of tomatoes, skinned and cut into halves, and sprinkle with sugar, salt and a little paprika; put in the rest of the rice and cover with the rest of the halved-and-seasoned tomatoes. Cover with buttered crumbs; put on the cover and place in a moderate oven to bake for twenty minutes. Uncover and bake until nicely browned. A cupful of cream sauce flavored with two tablespoonfuls of grated cheese may be poured over the dish intsead of using the buttered crumbs to make a pleasant change.

Gooseberry Pudding.—Two cupfuls gooseberries, two cupfuls diced stale bread, one and one-half cupfuls sugar, two tablespoonfuls butter, a pinch of salt. Remove the blossoms and stems and cut the gooseberries in halves. Brush a baking dish with butter and put alternate layers of bread, berries and sugar—three of bread and two of berries and sugar. Put butter on top; cover, and steam for one hour; uncover and put in a moderate oven for one hour.

Red Raspberry Tapioca.—One cupful red raspberries, one-fourth cupful tapioca, one-half cupful sugar, a pinch of salt, one egg. Using one cupful of water, boil the tapioca until thick; then add raspberry juice, sugar and salt; boil until clear; pour into glasses. Separate the egg, and beat the white until dry, adding one tablespoonful of sugar; cover the tapioca; dust with pulverized sugar, and place in a pan of water and set in an oven to dry. The raspberry juice is made by mashing berries with a quarter of a cupful of water; put on the fire and boil for three minutes then mash through a strainer.

A quart of milk is equal in food value to eight eggs, a pound of steak, or half a pound of cheese. This is the statement of the committee on utilization and economy, Kansas council of defense. Milk, it is pointed out, is a cheap tissue builder, because the protein that it contains is of a kind particularly valuable for building tissue. Ordinarily milk is the cheapest and most valuable source of lime and phosphorus. Milk is deficient in iron, but the iron that it contains is particularly well utilized by the body.

When writing to advertisers kindly mention The Wisconsin Farmer.

A real furnace. Exactly same construction as the old, reliable *Mueller* line, but without pipes or flues. Ideal for old or new homes and buildings with small or partial cellars. Saves 35% in fuel; burns hard or soft coal, coke or wood. Heats whole house comfortably, dependably, cleanly and economically *from one register.*

Made of solid cast iron, has triple jacket, substantial firepot and radiator, best type grate. Designed right, built right; 69 years of experience and the *Mueller Guarantee* behind it.

Tear out this ad, write your name and address on margin and mail to us for valuable free book on pipeless heating and name of nearest Mueller dealer.

Badger Meat and Butter Record.

Over 5,000 Pounds of Meat and 750 Pounds of Butter a Minute Produced in the State of Wisconsin.

WISCONSIN is coming strong on food production, and our meat products are helping to swell the big total of money received by the farmers of this state for butter and cheese. Those who may have imagined that the production of meat in this state is not an important item will be interested in the official figures. Comparing Wisconsin's meat production in 1910 with that in 1915 shows an increase of 100 per cent. In the year 1910 approximately 500,000,000 pounds of mutton, beef and pork were produced in this state. In 1915 this total had increased to 973,713,000 pounds, entitling Wisconsin to a front rank among the states producing meat products. The accompanying illustration shows the production in pounds annually, daily, hourly and even down to the minute. In 1910 the record was 1,370,000 pounds a day, 171,000 pounds per hour and 2,850 pounds a minute. In 1915 the daily production of meat in Wisconsin had increased to 2,667,700 pounds, the hourly production to 333,463 pounds and the meat produced each minute to 5,557 pounds. With the extra effort which is being put forth this year these figures will be increased to a great extent when the records for 1916 and 1917 come in. An increase of one or two beef animals, an extra hog or two or two or three sheep per farm in Wisconsin, would swell these interesting total figures to such proportions as to put Wisconsin in a commanding position among the meat-producing states of the Union.

Official figures give Wisconsin's butter record for 1915 at 132,588,551 pounds. Every minute of the twenty-four hours of each day Badger dairymen produced more than 750 pounds of butter. On the whole, Wisconsin produced 13 per cent of all the butter produced in the United States. That there will be a good increase this year goes without saying.

WISCONSIN MEAT PRODUCTION AN IMPORTANT ITEM.

Farmers of Wisconsin have made good profits both in the production of meats and butter and there is every indication that the markets in these products will remain staple. Wisconsin not only has a good record for production but also an enviable reputation for quality.

WISCONSIN BUTTER PRODUCTION IN 1915.

What County Agents Are Doing.

This Has Been a Year of Great Activity Under This New System and a Great Deal of Good Has Been Accomplished.

THE county agent fits very well into the economy of things, agriculturally speaking, in a year like this when all good advice looking toward the greater production of food is appreciated by everyone. It is probable that the year 1917 will prove the county agent system to the extent that there will not be the opposition to his system in the future that there has been in many counties of the state in the past. From reports sent to the superintendent of Wisconsin county agents we gather the following, indicating some of the activities under this system:

Ashland County.—The farmers of Ashland county have secured all the seed they need for spring seeding through the efforts of the county representative with the coöperation of the county council of defense. A carload of lime was recently distributed to the farmers in the vicinity of Butternut, and forty bushels of seed potatoes were treated at Glidden.

Barron County.—Hog cholera has again appeared in Barron county, but no time was lost in taking steps for its prevention. The county representative secured the assistance of the state veterinarian and a large number of herds have been vaccinated. In one case, a farmer lost hogs worth $250 from the disease because he did not believe in the treatment and did not get his hogs vaccinated, while his neighbors about one-half mile away vaccinated their swine and suffered no losses. Two carloads of limestone have been ordered by farmers in the vicinity of Barron, Mikana, and Angus and twenty-nine head of cattle were sold to outsiders.

Bayfield County.—Certain sections of Bayfield are well adapted to the raising of fruit. Considerable effort has been made by the county representative in giving information relative to planting, pruning and spraying of fruit trees and fruit bushes. Much has also been done with the boys' and girls' clubs. They have used eighty-eight bushels of potatoes and a large quantity of garden seeds and No. 23 seed corn.

Brown County.—During May, 762 bushels of potatoes were distributed among the farmers by the county representative with the assistance of the county council of defense, at a net saving of $100. Funds for loans were pooled by several banks of the county to the extent of $3,800. Brown county will do its share in bean production this year.

Burnett County.—Much time and care have been spent by the county representative in coöperation with the county council of defense in supplying farmers with grain, potatoes, navy and soy bean seed.

Douglas County.—A fund of $5,000 has been provided by the county board to furnish money to worthy farmers wishing to buy seed. Plans are being completed to make a raid on the stumps this fall. Already 1,100 pounds of dynamite have been secured for this purpose.

Eau Claire County.—Talking better live stock, soil acidity, and gardening has kept the county representative busy during the past month. He has also been investigating labor conditions and teaching agriculture in the training school.

Forest County.—Over 1,500 bushels of seed potatoes and twenty-five bushels of seed corn have been distributed among farmers of this county. A large portion of this corn will be used for ensilage. Seed grain and rutabagas were distributed in considerable amounts. It is estimated that Forest county will have 200 acres in rutabagas. The second car of dynamite for land clearing has arrived.

Jackson County.—A total of 1,256 farmers and others were present at six patriotic meetings held in different sections of the county by the county representative in coöperation with the county council of defense. Jackson county has done its share in putting in seed for increased food production. Potatoes, navy beans, corn, alfalfa, oats, and buckwheat have been widely distributed by the county representative.

Kenosha County.—No pains were spared by the county representative this spring in getting plots of Grimm's alfalfa started for demonstration purposes. The growing of alfalfa is becoming more and more popular with the Kenosha county farmers. Preventive measures have been taken for scab, blight and potato bugs. More Kenosha farmers this year than ever before are planting beans, cabbage, beets and onions. He has also placed hired help with ten farmers of the county.

Langlade County.—Many farmers have treated their oats for smut as the result of an extra effort put forth by the county representative in this direction. In coöperation with the county council of defense, seed potatoes, beans, corn and oats have been distributed. This looks like a big "food" year for Langlade county.

Lincoln County.—Inspecting seed grand and potatoes and alfalfa plots kept the county representative busy this month. He also planned several barns and worked on the demonstrational plots of his field projects.

Oneida County.—Credit propositions are doing a great deal for increased crop acreage in Oneida county. Two carloads of fertilizer have been purchased through the office of the county representative.

Polk County.—In coöperation with the council of defense, the county representative purchased 800 bushels of seed potatoes for distribution, at a considerable saving to the farmers of the county. Valuable help has been rendered by the county representative this month in bringing farmers who had potatoes, beans and live stock to sell in touch with those who wanted to buy. Because of an outbreak of blackleg at Osceola, where five calves died from the disease, a vaccinating demonstration for its prevention was given. Visitors to this demonstration were so pleased that they suggested a town meeting, which was very successful.

Portage County.—Fifteen farmers' meetings covering every section of the county have been held during the first half of the month by the county representative in coöperation with the county council of defense: 3,714 farmers were present. Local bankers have furnished soy beans for demonstration plots on the light soils of this county.

Price County.—The boys and girls are doing their bit in Price county. Several new orchards have been planted and such fruit trees as Wealthy, Duchess, Greening, Hibernal and Whitney crabs have been set.

Rock County.—Recently, the employes of one company in Beloit were addressed by the county representative on the rudiments of gardening. As a result the company has secured thirty acres of land in one plot and also the use of many vacant lots in the city for gardens. Over 800 bushels of potatoes have already been planted under the direction of two expert gardeners employed by the company.

Rusk County.—Through the efforts of the county representative and with the coöperation of the bankers at Hawkins Rusk county farmers have secured a carload of 700 bushels of seed potatoes. The potatoes were loaned on share basis with the understainding that the seed would be returned in the fall. At least fifty settlers who would not have been able to do so otherwise were thus enabled to plant an acre each of potatoes.

Sawyer County.—By the prompt action of the county representative and the assistant state veterinarian what would probably have been an epidemic of hemorrhagic septicaemia among the cows was recently averted at the Indian Farm School. A hundred children have been organized into a garden club. The city of Hayward furnished the land and fitted it for garden.

Taylor County.—One farmer of Taylor county built the first silo in his community last year and this spring felt happy that he had sufficient supply of corn silage and remarked that his cattle never looked better. He is also balancing up the rations for his dairy cows, buys concentrated feeds, weighs and tests the milk from his herd and now has completed a year's record of his herds—all upon the advice of the county representative. Five silos are being built in that neighborhood this summer.

Vilas County.—A number of farmers have recently purchased a carload of dairy cows from Barron county. This is an important point in the dairy history of the county. Spraying fruit trees, planning ventilation in barns, delivering seed corn to various farmers, assisting with the distribution of dynamite, testing milk and cream, and working on field demonstration plots are activities which have occupied most of the county representative's time recently.

Walworth County.—It is expected that 10,000 gallons of sorghum will be manufactured in Walworth county this fall; plans are being made to operate five sorghum mills. Sixteen men and two boys from the high school have been placed as hired help with farmers. Nine canning demonstrations with a total of 1,500 people in attendance were held in coöperation with the home economics department of the university. The gardeners' association of Lake Geneva has promised to grow a large number of cabbage and tomato plants for distribution among the poor people of the county.

In seventeen recent Short-horn sales 760 Short-horns sold for a total of $602,010, an average of $800 on the entire number, and yet only two prices in the long list that could be called even approaching the spectacular—a yearling imported bull, Caledonia, sold for $7,000 and a two-year-old home-bred bull, Rosewood Reserve, sold for $8,100.

Raise High Priced Wheat on Fertile Canadian Soil

Canada extends to you a hearty invitation to settle on her **FREE Homestead lands of 160 acres each** or secure some of the low priced lands in **Manitoba, Saskatchewan and Alberta.** This year **wheat is higher** but **Canadian land just as cheap,** so the opportunity is more attractive than ever. Canada wants you to help **feed the world** by tilling some of her fertile soil **—land similar to that** which during many years **has averaged 20 to 45 bushels of wheat to the acre.** Think of the **money you can make** with wheat **at over $2 a bushel** and land so easy to get. Wonderful yields also of **Oats, Barley and Flax. Mixed farming** in Western Canada is **as profitable an industry as grain growing.**

The Government this year is asking farmers to put increased acreage into grain. There is now a great demand for farm laborers to replace the many young men who have volunteered for service in the war. The climate is healthful and agreeable, railway facilities excellent, good school and churches convenient. Write for literature as to reduced railway rates to Supt. of Immigration, Ottawa, Canada, or to

George A. Hall

WILL TRADE IOWA FARM FOR CATTLE

WE WILL EXCHANGE A GOOD IOWA FARM for a top quality herd of Hereford cattle. Write, giving full particulars, to
AMOS BURHANS **WATERLOO, IOWA**

FARM FOR SALE—133 acres, heavy clay loam; 30 acres timber, balance productive fields that produce acre for acre as much as any land in the West; great markets; ½ mile from town and railroad; new 10-room house, full basement; telephone; large new basement barn, hen houses, fruit; fine climate, mild winters. Price $3,000, half down, balance on easy terms. Send for free photos and description. A. L. Wilkins, R 1, Union, N. Y.

FARM WANTED

Wanted to hear from owner of good farm for sale. Give cash price and description. Write
JOHN H. OAKS, 414 Main St., OSHKOSH, WIS.

Small Grains Growing Rapidly.

Oats Promise Well—Pastures Show Big Improvement—Hay is Excellent in Most Sections—Cold Weather Retards Corn.

WISCONSIN.

Adams County.—Weather continues cold, wet and backward. Corn has made very little progress. Cutworms have damaged it to some extent, and the general outlook for corn is good at present. Rye and oats look well. Tame hay will make a bumper crop. Potatoes are good except on low, heavy land, where the seed rotted. Cattle are doing well; there are fewer young stock than usual. All crops have about the usual acreage.—W. B. Barnes.

Brown County.—Weather is cold and wet at present. Frequent rains prevent cultivation. Corn and small grain suffer from excessive rain. All crops are late. Pastures are improving. Live stock look well. The acreage of sugar beets is falling off somewhat. Grain crops are late and may yield less than the average.—J. D. McAllister.

Buffalo County.—Crops are backward, especially corn. Clover and alfalfa are doing well, however. Fruits and vegetables are normal. Live stock gained considerably after going on to pasture. The milk flow is less than last year, but the price of milk is higher. There has been too much rain to keep the roads in good condition.—John Wald.

Clark County.—Warm weather and plenty of moisture are pushing the corn forward, but the crop is not yet normal. Hay is growing well, but will hardly reach normal height. Clover looks well. Oats are growing rapidly and look fine. Pastures have improved much and stock are in good condition. Fruit promises well and garden truck grows well under present conditions.—Louis Buddenhagen.

Door County.—Spring was cold and backward. Hay and clover meadows look well; the stooling has been satisfactory. Oats need warmer weather. Hogs are scarce and small pigs in demand. Replanting of corn was necessary in many cases. Oats will be good if weather stays warm. A large planting of potatoes is expected.—John Aznoe.

Douglas County.—The spring wheat acreage is larger than usual. More potatoes than usual were put in. Planting was done in better shape this spring than usual because of favorable weather. Small grain is late, but with favorable weather from now on will make a good crop. Pastures are fine. Live stock are in good condition.—J. N. Ottum.

Dunn County.—The season is cold and backward. Small grain looks fine, but corn stands still. The hay crop will be between light and medium yield. Strawberries promise well.—J. D. Millar.

Fond du Lac County.—Wet, changeable weather has delayed growth of crops. Oats, barley and corn have been considerably retarded. But winter grains are different, rye and wheat being in fine condition. Prospects are good for heavy crops of hay, especially alfalfa and clover. New land and pastures are being broken and the increase in acreage of cultivated land is about 10 per cent as compared with last year. Live stock are in good condition and pastures promise to hold out for some time yet. The increase in dairy cows and heifers is noticeable, and the dairy output is surpassing all previous records for the county.—C. A. Williams.

Iowa County.—Small grains look well. The straw will be heavy. Corn is backward because of damp, cold weather and cutworms are damaging some fields. Replanting is in progress. Pasture is abundant and hay promises well.—J. M. Blotz.

Juneau County.—Small grain looks well, except rye, which will make only one-half a crop. The acreage of all small grains will be about 25 per cent larger than last year. Corn is not doing well because of damage from cutworms and wet weather. Some replanting is necessary. Fruit and garden truck are good. Stock enjoy good health and are normal in number. Pastures are good.—C. E. Haskins.

Lafayette County.—Weather is wet and corn lags three weeks behind. Weeds have come up in many fields. All small grain, besides meadows and pastures are above normal. Fruit promises a fair crop. Gardens are doing well. More potatoes than usual are planted. Few colts were raised and low prices for horses have checked breeding. Milk is worth more than $2 at the cheese factories. The pig crop seems below average.—W. J. Martin.

Langlade County.—Crops are poor because of cold weather. There is not much difference between this year's acreage and last year's, except more corn was planted this year where old meadows killed out. Rye headed out well; some fields are very good, but others show winterkilling. Oats, barley and spring wheat are backward. The stand of new clover is good, but the growth short. Meadows also are short and pastures are cropped close to the ground. Corn is up, but growing slowly. Potatoes look well. Live stock show effects of short pastures. Pigs rank low in number. Labor is scarce at this time.—Chas. Lade.

Lincoln County.—Small grains are fine. The season is late and crops are about ten days late. Hay will make an average crop. Potatoes are growing nicely. There are about 50 per cent more gardens than usual and all are in fine shape. Live stock are healthy; the number of milk cows is increased, but young stock are only normal in number.

Oneida County.—Most of the potatoes are up and doing well. But heavy rains have prevented cultivation. Grain and hay are fine. It is too wet and cold for corn. Cattle are in excellent shape, because of the good pastures. Beans, peas and small fruit look well. The potato acreage is larger than usual and many rutabagas were put in this year.—Chas. H. Jewell.

Manitowoc County.—Small grain has an increase in acreage of from 5 to 10 per cent, but the crops are backward on account of continued cold weather. The corn acreage is 10 per cent above average. Much of it on lowlands must be replanted. Hay does not promise well at present. Live stock are normal and show considerable improvement since going on to pasture.—Edward E. Straka.

Marinette County.—Potatoes have made excellent growth. Winter wheat, rye, oats, clover and grasses have suffered from cold wet weather. Warm weather may bring all crops up to normal except hay. Corn is from four to six inches high. Pastures have grown slowly, which is discouraging to those feeding a large number of stock. Dairy cows look well and many new cheese factories are being built to handle the milk. The coöperative cow-buying association delivered a load of splendid dairy cows here last week. Fruit prospects are only fair.—W. E. Morton.

Marquette County.—The increase in acreage of all crops is about 10 per cent. Winter wheat is making good progress. Oats look fair and rye seems good. Clover is better than last year. Little spring wheat and barley is raised here. Pastures are normal. Live stock are thrifty. Rainfall is plentiful.—Emil Hein.

Sauk County.—Corn is small for this time of year. Hail and excessive rain did considerable damage to it. Hay will yield heavily. Rye shows improvement, but will be a light crop. The potato acreage is about normal. Live stock of all kinds look fine because of good pasture.—A. H. Buehler.

Sawyer County.—Weather continues cold, with plenty of rain. Potatoes are coming up and appear well. The acreage is about 10 per cent greater than that of the last five-year average. Grain is nearly three weeks late. Grass and pastures are also late. Much clover winterkilled and hay will not be plentiful this year.—Jens Uhrenholdt.

St. Croix County.—More wheat was sown this year than formerly. The acreage will be about 10 per cent greater than last year. The stand of all grains is good, but growth is backward. Rye fails to equal last year's crop. Wheat, oats and barley promise well. Hay averages below last year's prospects at this time. Pastures are good. Early potatoes are larger than usual, and the outlook promises a record-breaking yield. Cattle went to market in large numbers and no increase is expected this year. The pig crop falls below the average for several years.—Stephen Everson.

Taylor County.—Cold weather has retarded growth of crops; hay is nearly a month late. Pastures look well and live stock are doing fine. Potatoes and all other garden truck are growing slowly. Good crops may be expected if the weather is favorable from now on. Much new land was broken this spring and many new gardens were planted. Pigs are scarce and sell for from $12 to $15 a pair. Horses are plentiful and sell with difficulty.—E. H. Dehne.

Trempealeau County.—Small grain looks fine. Corn has been held back by cold nights and continuous rains, but warm weather is now pushing it along rapidly. Cutworms and crows have done some damage. Pasture is abundant and cattle look fine. Hay promises to be a good crop. The wool clip is rather light, due perhaps to cool weather.—Carl Kremm.

Walworth County.—Weather continues wet and cold. Small grains and pastures are good. Meadows look well. Corn is small for this time of year and weeds are getting a start. Hilly ground planted to corn has been washed badly by rain. Considerable wool was produced this year and buyers are paying 50 and 60 cents for it.—A. E.

Washburn County.—Hay and grass are short, though the rains have been good. Small grains look well. Corn has a good stand, but cutworms have been at work in the spring sod. Three months of hot weather and plenty of rain are needed.—John W. McCulloch.

Wood County.—Cold weather and late frosts have kept the crops back, but since June 1st more seasonable weather has started vegetation in fine shape. The meadows are about 10 per cent below average in acreage and cultivated crops, especially beans, have been put on the land. Buckwheat is replacing beans on areas that were damaged by cutworms. Potatoes are fine and the acreage of them is normal. Gardens are growing fine. Oats promise better than last year. Rye is heading out fine. Barley is 5 per cent better than last year. Pastures are medium. More cows and fewer steers are on hand.—P. B.

A CLASS OF INDIAN FARMERS AT INDIAN FARMERS' INSTITUTE, MAUSTON, WISCONSIN.

A profit at the rate of $3,676.46 an acre was the pace Miss Corrine Freeman, state canning champion, set in her school garden at Holdredge, Nebraska, in 1916. Miss Freeman's garden was only fifteen by twenty feet, but she grew fourteen different kinds of vegetables in it. Tomatoes, Swiss chard and eggplant were the most profitable crops. Miss Freeman's books on the garden show that she sold $3.88 worth of vegetables, used $19.60 worth for the home table and canned $4 worth, which makes the yield $27.48. Her expenses were $2.16.

THE GOOD JUDGE TELLS WHICH IS BETTER, AND WHY IT IS.

A good many people are looking into what makes men change over to W-B CUT and stick to it so. Tobacco is tobacco, but all chewing, isn't *all* tobacco. You don't have gummy excess sweetening to chew out of W-B CUT, before you get down to satisfaction. The shreds are tobacco, through and through—and the richest, sappiest tobacco that grows. You notice the difference at once—W-B CUT goes twice as far as ordinary plug.

Live Stock and Commercial Notes.

Gathered by Representatives of The Wisconsin Farmer.

Watch For Dobson & Eastman at Fall Fairs.

WE recently had the pleasure of inspecting the show herd that Dobson & Eastman, Lancaster, Wis., are preparing for the fall fairs, and they certainly have the goods. With the exception of a junior yearling boar their show herd will be made up of underyear stuff. The junior yearling boar weighed 530 pounds June 20th, and can carry a lot of flesh yet, so that we expect to see this firm have out one of the largest yearlings to be seen this fall. Burlie has the pigs on full feed and on the above date they weighed right at 100 pounds. One was weighed and she weighed 110 pounds. They have three good fall sows, but one is outstanding and will certainly make a creditable showing. They will weigh right at 400 pounds each. Burlie says that his pigs are better this year than at the same time last year. The pigs are by Double Hadley, Big Ben Jr., and Sunrise rice. The fall stuff is by last year's show boar, D. & E.'s Jumbo. The Grant county Poland China breeders held a meeting on June 20th, and October 8th was selected for the annual boar sale. Bear this date in mind. Thirty boars and ten open gilts will be sold at that time.—Adv.

Big Joe.

WHEN in Iowa and you hear the name Big Joe you think of a noted Poland China boar. In Wisconsin we have a Big Joe, but he gets his name by being one of the big men in the Poland China World—Joe Hendricks, of Hazel Green, Wis. There are several good herds of Poland Chinas in the state, and by past records Joe has demonstrated that he is in the very front row. At this time he has a great bunch of porkers. At this time last year this breeder had a very common lot of Poland China pigs, but those that attended his sale know that he had the goods then. This year his pigs are as good and bigger than any we have seen, so with this start we will leave it to you to imagine what they will be by fall when the boars are ready to sell. Of course he will sell boars now if you want to grow them out to suit yourself. Of course you will have to pay for the feed if you wait until fall, and no doubt you can feed them cheaper than Joe. It will pay you to take a drive to Hazel Green and see two of the best herds of big types in the country.—Adv.

Morehouse Polands Doing Fine.

WHILE at Lancaster we saw the 65 pigs that Frank Morehouse has on full feed and they are doing as well as any we have seen. Frank will have some good boars and gilts of the best big-type breeding to offer at a later date. The pigs are by Big Type Jim, a son of Jim Crow, and out of Big Type Bess, the top sow of the Madison sale last winter. Some good pigs are by Big Ben H., he by the noted Big Ben, out of a daughter of the great brood sow, Great Lady C. A sow by the highly-advertised boar, Goldengate King, had a litter by the Minnesota boar, Melbourne. One of the best litters on the farm is by Big Type Jim, out of a daughter of Black Orange by Big Orange. Keep this herd in mind. Morehouse has good Polands and will treat you fair. His advertisement will appear in The Wisconsin Farmer at a later date.—Adv.

Good Short-horn Sales Continue.

WE have just been advised by Albert Maurer, of the firm of Richard Maurer & Sons, Fox Lake, Wis., that the demand for Short-horns is greater than the supply. His letter reads: "The bulls about which you gave us a write-up have all been sold. Carlson Bros., of Minnesota, bought the bunch. During th epast week we sold a Scotch cow and calf and two Scotch-topped cows, one with calf at foot, to one of your advertisers, P. N. Collins, River Falls, Wis. Mr. Collins has some good Short-horns, and we were glad to be favored with his business. The Wisconsin Farmer does the work, and we thank you for your good service."—Adv.

At Ed Hendricks'.

IF you want to see a good bunch of the "big kind" Polands take a trip to Ed Hendricks, Hazel Green, Wis. Ed had the goods last year, but we will go on record as saying they are better this year. He is not certain whether he will make a sale this fall or not, for he is having such a demand for his pigs already, but he is holding all of the tops and if he does make a sale it will be one of the best offerings ever sold in the Northwest. Model Major 2d is the big noise on this farm, and if there is a real 1,000-pound prospect in the state this boar is in that class. Black Jumbo is still on the job, but he is too well known to need any comment at this time. When you think of good big types think of E. W. Hendricks.—Adv.

The Home of Orion Cherry Col.

YOU Duroc breeders of Wisconsin should get the name Orion Cherry Col. fixed in your mind, for there is a boar by this name in the southern part of the state that we believe will be heard from in the future. He is sired by Walt's Top Col. and out of a daughter of the dean of Durocs, Orion Cherry King. This boar is right in every way and with the care that he is getting at the hands of the Runde Bros., Cuba City, Wis., he should make "some boar." This firm has just started with pure-bred Durocs and they expect to have one of the good herds of the state in a short time. They have a good litter sired by Waltemeyer's Great Wonder—the boars will be for sale, the gilts will be retained in the herd. One of the best litters at this time is by a son of the champion. Burke's Good Enuff, and out of a Big Col.-Chief Defender dam. They also have other litters on the farm sired by an Advance bred boar. The pigs on this farm compare favorably with any we have seen. As mentioned above, the Runde Bros. are good feeders, and when you find a good feeder you generally find a man that will make a success of the hog business. We will have more to say about this herd later, but don't forget Orion Cherry Col.—Adv.

Pease's Model Giant.

WE have just had a letter from L. E. Pease, Wales, Wis., advising that his good Poland China boar, Model Giant, will be at the fairs this fall. Mr. Pease did not intend to show this boar, but he looks so good at this time, he thinks it advisable to get him where people can see him. On June 1st he weighed 700 pounds, which is a good weight for a senior yearling that has not been overly crowded. The spring pigs by this boar look fine and the fall gilts, that weigh over 300 are bred to Model Giant to farrow in September. Fall gilts that weigh 300 pounds and bred to such a good boar should be a good property. Write for details.—Adv.

John L. Fisher Buys Noted Holstein Bull.

JOHN L. FISHER, Janesville, Wis., appreciates the value of a good sire whether it be cattle or hogs. Mr. Fisher has been looking for a good bull to head his Holstein herd for some time, and finally selected the good yearling bull, King Segis Pontiac Isaac. As a calf this bull was second at the Iowa State Fair, first at the Indiana State Fair, second at the New York State Fair and first at the National Dairy Show in 1916. He also headed the first-prize calf herd at three state fairs. He is sired by King Segis Pontiac, out of a well-bred A. R. O. dam. This bull topped the R. E. Haeger Holstein sale, going to Mr. Fisher at $1,525. With King Defender at the head of his Duroc Jersey herd and this young bull heading the Holsteins, Mr. Fisher has two excellent sires. Just at this time he is offering for sale registered heifer and bull calves. Write him.—Adv.

Galloway Cattle For Sale.

IF you want to buy some good Galloway cows and heifers or some nice serviceable young bulls it will pay you to go and see C. S. Hechtner, Chariton, Iowa, who is offering 40 head of cows and heifers for sale and 16 head of bulls. There is no better Galloway herd in America than the Hechtner herd and he is making prices on these cattle that will insure their making money for any man that buys them. Kindly mention this paper when writing Mr. Hechtner. See page 16.—Adv.

Calf Goes to Tennessee.

WHAT Fred Pabst terms the best-marked calf he has had for sale this season is Pabst Korndyke King, purchased recently by R. H. Hill, Isabella, Tenn. This wonderful individual was born March 27, 1917. His dam, Pabst Lulu Lady by King Pontiac Champion, has a junior two-year record of 849 pounds butter and over 20,000 pounds of milk. This cow was one of the 25 leading Holsteins last year. Her dam, Lulu Hartog De Kol, has a seven-day record of 28.55 pounds butter, testing 3.78. The sire of this calf is Korndyke Segis Johanna, whose three nearest dams average over 38 pounds.—Adv.

Buy Your Angus Cattle in Grant County.

THERE is a great advantage in having a selection from which to pick when buying any kind of live stock. With this thought in mind we call your attention to the advertisement of the Grant County Aberdeen Angus Breeders' Association, that will appear regularly in The Wisconsin Farmer from now on. There are some 800 head of registered Angus cattle in Grant county, Wisconsin, and we believe we are safe in saying that there are more high-class cattle of this breed in Grant county, than in all the rest of the counties in the state combined. The secretary of this association is Walter J. Steinhoff, Platteville, and he has a list of all the females and bulls in the county that are for sale. Write Mr. Steinhoff what you wish to buy, and your inquiry will have prompt attention.—Adv.

Do You Want Polands With Stretch?

STARTING with this issue Aug. Neeseman's Poland China advertisement will appear regularly in The Wisconsin Farmer. This breeder's postoffice is Warren, Ill., though his farm is located in Wisconsin. e has the big-type Polands, and up to date we have not seen a bunch of spring pigs with as much length as the Neeseman Polands. The average farmer herd of sows is too short and "chubby," but the Neeseman type will fix that and you will get some sows that will raise big litters of big pigs. This herd is full of the very best breeding and we feel sure that the boars and gilts that are now ready for shipment will meet with approval. Let this breeder quote you prices. A good place to buy a trio and get started with registered Poland Chinas.—Adv.

Shanks and His Investor Durocs.

FROM time to time our readers have read about the great work done by W. N. Shanks, Worthington, Minn., in developing one of the leading herds of big-type Durocs. Mr. Shanks has each season added to his herd both in size and in quality. His Durocs are favorably known in all of the western states where Durocs are grown. There has been no boom and no bluster about his work. He has bought the best to be found. His instructions to the field men who have bought for him have always been to buy the best, but he insists on size, strong backs, and perfect feet. The offering which he will put up in August is such as to cause most men to marvel. The get of the great Investor are proving, in his hands, to be by far the best things he has raised. Most of these are from daughters of High Model or King the Col., a few being by Grand Model 12th. In the August 14th sale there will be 15 spring boars, 15 fall boars and 15 sows bred for fall farrow. This sale offers attractions enough to cause any man to travel clear across the continent if he is after a real big boar. Investor is some real boar. He has that immense size which is demanded and with that size he has the feeding quality which is absolutely essential to any animal, the ultimate end of which is the meat barrel. It is all right to talk big-type and extreme type, but unless you maintain fleshing qual'ty along with that size you are a loser. Investor is an easy flesher. He is as soft and mellow as you could wish. At the proper time we shall have more to say about this good boar and the excellent lot of boars which Mr. Shanks will sell that were sired by him. Note that the boar sale is August 14th. In writing Mr. Shanks concerning this sale, or anything else of interest, please mention this paper.—Adv.

Quackenbush Boar Offer.

THE name of W. W. Quackenbush, Melrose, Wis., is familiar to the men interested in Poland Chinas. This is due to the fact that this breeder purchased some of the best sows that were sold last winer. Just at this time he is offering spring boars for sale and he has some dandies. Don't get teh idea that the sows he bought last winter are all he has. Owing to the fact that pork was high he sold some of his brood sows hat did not come up to standard, keeping only the very best, and to these he added the sows above mentioned, giving Mr. Quackenbush at this time a very high-class lot of Poland China sows. The get of several

Brought Success Beyond Expectations

THE advertisement we inserted in your paper announcing our sale, brought us success beyond all expectations. Hoping that we may use The Wisconsin Farmer as an advertising medium again.—H. L. Weber, breeder of Holstein cattle, Oakfield, Wis.

noted boars is represented in this pig crop. He has breeding that will not conflict with what you have in your herd. Let him quote you price. We are glad to recommend this herd. Melrose is near lack River Falls, his shipping point.—Adv.

Where to Get Red Polled Cattle.

IN this issue of The Wisconsin Farmer can be seen the names of the men in the state of Wisconsin who breed and sell Red Polled cattle. If you want to buy a bull or some females write to one of the breeders whose names appear in this list . If he cannot supply your wants he will refer your letter to someone who can. Also notice the Red Polled article that appears in this issue written by L. C. Underwood, Avoca, Wis., the secretary of the Wisconsin Red Polled Cattle Breeders' Association.—Adv.

Martiny Offer.

WITH this issue of The Wisconsin Farmer, Riley Martiny & Son, Baraboo, Wis. change their Duroc advertisement and offer for sale their spring boars. Their pigs are good, several of them weighed over 100 pounds June 15th and they are out of those good, big sows that this firm purchased last winter for use in their herd. We do not hesitate to recommend this Duroc herd.—Adv.

Oct. 17, L. F. Atwater, Bangor, Wis.

Duroc Jersey.
Oct. 8, Rock County Poland China Breeders' Sale, Lancaster, Wis.

THE MARKETS.

Union Stock Yards, Chicago, Ill., June 30.—Prime corn-fed cattle of all weights have held up well again this week, though a liberal mid-week supply effaced 10@15c advances shown Monday, even on that kind. All other classes have been in super-abundant supply and the market has declined unevenly, the medium and low-priced grassers still undergoing a sharp downward revision in values that is to be expected at this time of the year. A new high record top has been made this week at $13.90 and the surprisingly large number of long-fed bullocks, considering the abnormally high corn market, have been included in the run. Many choice seven-to-ten-months-fed cattle, both in yearling, handy and heavy weights, have sold up to $13.25@13.75. The spread is wide, however, and killers are now getting a lot of decent, though light and grassy, dressed beef steers of warmed-up- class down around $10.00@10.75.

Hog supply statistics are deceptive, grassy and common light mixed stuff is always plentiful at this season, but current scarcity of corn has aggravated conditions and probably fewer good corn-fed hogs have been yarded in a run of about 115,000 here the first five days this week than the trade has ever known in June. The $16.00 quotation has been eliminated, temporarily at least, the best hogs selling here yesterday at $15.75 with few above $15.50, but the spread is rapidly getting wider and the bulk of the packing grades are now going below $15.00, common heavy packers selling in carload lots as low as $14.20.

A free movement of new crop lambs running direct to packers through the Louisville and Nashville gateways and some little increase in the market-supply here, have swelled sheep-house receipts this week to almost double the proportions of the week previous and the market has slumped off rather sharply, but not unexpectedly, from recent high levels. Most everything on the list is closing $1.00@1.50 lower than a week ago, but the market might break $3.00 per cwt. more and still be abnormally high for the season, though there is small chance in trade opinion of the common price for good fat lambs dropping below $15.00 at any time this summer. The movement of range lambs out of Idaho, already three weeks late, is on the horizon, some having reached Missouri river markets, in fact, this week where initial sales were made at $18.40, against $11.65 for the first shipment reaching Chicago last year. High prices will tend to draw the stuff marketward as early as it is ready to come, but owing to the shortage of breeding stock winter losses and a desire on the part of range flockmasters to conserve as large a proportion of their ewe lambs as possible, owing to the known world-wide scarcity of wool and mutton existing, many well-posted traders expect to see the summer run of range sheep and lambs fall forty to fifty per cent below that of last year.

Cattle trade started off the week in healthier condition than the close the week previous, a moderate Monday supply finding a strong to 10@15c higher market and top steers being boosted to $13.90, for a new yard record. The advance, however, along the liquidating influences of the high cost of feed and, insofar as the lower priced grass cattle are concerned, the drowning out of pastures in some sections, prompted free loading for the mid-week market which was 10@15c lower than Monday on most everything, while additional weakness th latter half of the week put the bulk of the steer run below choice 15@35c lower than a week ago, some grassy stuff being as much as 50c under Monday Next week's supply will be cut into by the Fourth of July holiday, eliminating one of the principal market days of the week, and the trade is expected to respond to stimulus of moderate receipts, with some reaction from declines this week. It is the general expectancy of the trade that good to choice cattle will gradually work higher, while on the other kinds, erratic and uncertain markets are to be expected until grass stuff has subsided to a rock-bottom basis for the midsummer season.

Butcher cattle have formed a small proportion of the week's bovine marketing and the market made some recovery early in the week from declines shown the week previous. However, the gains have been more than lost on the common and intermediate gradse of cow stuff. Prime dry-lot beef cows and heifers are in the category of specialties and are commanding wide premiums. A small bunch of heifer yearlings of this class sold here on Thursday at $13.35, establishing a new high spot, but in the case of this high-dressing specialty stuff the same treatment that is accorded top-notch steers is logically forthcoming.

Interest in Red Polled Cattle.

(Continued from page 1.)

Red Polled cattle winning in the years mentioned were bred and fed by individual breeders.

I do not anticipate any difficulty in disposing of Red Polled breeding stock. In fact, Red Polled cattle will stand up with any of the breeds in these days when surplus stock of good breeding is so much in demand. Most of our Red Polled breeders are now kept sold down to the calves but a few weeks old. If we could have more good breeders, and a little better advertising, so that the stockmen of our country would better understand the nature of this great breed of cattle, we would see Red Polled catle much more widely distributed than they are today. As secretary of the Wisconsin Red Polled Cattle Association I am often asked the question, "Where can I find some good Red Polled cattle?" Too frequently I do not have a list on hand to which I may refer prospective buyers. But our breed is growing splendidly and the number of animals recorded in the past few years has increased about 100 per cent.

In conclusion I want to say that we do not have "freaks" in the Red Polled breed. The Red Polled breed adheres closely to the law that like begets like; in fact, I believe this breed more consistently carries out the principle of this law than any other breed of cattle.

CHESTERS

BUY a "Baby Herd"—two gilts and a boor. I have six herd boars, every one a champion at some fair. I ship on approval and register free. Write for my catalog.

PABST STOCK FARM
(Breeders, Not Dealers)
Oconomowoc Wisconsin
Box F

KING PONTIAC SEGIS VEEMAN
(134190) IS FOR SALE

A 29.29-Pound Son of King Segis Pontiac Count.

King Segis Pontiac Count is a grandson of King of the Pontiacs, that has more thirty-pound daughters than any bull and is sired by King Segis Pontiac, that has sired more high-priced bulls than any sire.

King Segis Pontiac Count also has the distinction of siring the greatest producing junior two year olds of the breed. He has three junior two year olds that average 28.46 pounds butter in seven days and five junior three year olds that average 31.37 pounds and 610 pounds milk in a week. The herd at which King Segis Pontiac Count stands at the head leads all others in prize winners for A. R. O. work for the year just closing.

For further particulars concerning King Pontiac Segis Veeman write to Edgewood Stock Farm, Burlington, Wis.

A 27.81-lb. BULL

THE ABOVE IS THE AVERAGE RECORD for his dam and sire's dam. His sire is out of the famous 35.43 lb. cow, Pontiac De Nijlander. His dam has a four-year-old record of 20.20 lbs. butter. She has a 30 lb. daughter and a 25 lb. dam. A little more black than white; well grown and of exceptionally good conformation. Born February 1, 1917. For pedigree and further information address

A. M. ANDERSON WHITEWATER, WIS.

10 MORE COWS

OPPORTUNITY RAPS at every man's door. Here is a chance to get some fine animals to found a good herd of registered Holstein-Friesian cattle, for a small sum of money. Cows from $150 to $250. They are bred to Sir Johanna DeKol 19th 64143, a young bull weighing 2500 pounds, with nine A. R. O. daughters, a brother to two world record cows, whose sire has 66 A. R. O. daughters. These cows will soon freshen and their offspring will equal the value of the cows. Also six yearlings to sell at $125 a head. Wire or write immediately, as they are exceptionally cheap.

DR. B. L. WERNER MARSHFIELD, WIS.

RIVERVALE FARM

OFFERS SOME FINE HOLSTEIN BULL CALVES—very light in color, from A. R. O. dams and grandams and sired by Korndyke Pontiac Piebe Burke, a grandson of Piebe DeKol Burke, at very reasonable prices. Address

GEO. H. GIBSON NASHOTAH, WIS.

RUST BROS.

OFFER the richly bred Holstein bull, Sir Isa Lotta Hengerveld 188663, born Aug. 18, 1915. Ready for service. His dam, Ida Lotta Hengerveld, at 3½ years made 21.34 lbs. of butter in 7 days, 31 days after calving. She is from a long line of heavy producing ancestors, records of her three nearest dams averaging 27.20 lbs. butter in 7 days. She has inherited this heavy producing ability, and transmits it. Sire of bull for sale is Daisy Johanna 5th, 1st prize two year old at Wisconsin State Fair, 1915. His dam has two A. R. O. daughters. Arthur Rust, West Allis, Wis.

WE OFFER NOW FOR SALE

DAUGHTERS of Sir Johanna De Colantha De Kol 53056. We have 4 heifers about 6 months old out of him for sale. Price $600. They are nicely marked, well grown and backed by A. R. O. records and rich breeding. We also have a few heifers bred to a 33.68-lb. bull for sale and also several cows bred to the same bull. Prices on application. Inspection invited.

B. F. WINCKLER & SONS Medina, Wis.

FROM 5 MONTHS TO 15 MONTHS of age sired by the 31.17 lb. bull, Sir Wayne Johanna DeKol. Two bull calves also for sale. Address

LAWRENCE ROBERS LYONS, WIS.

BUY HIM NOW

A Jan. 15, 1917, bull calf, evenly marked, tuberculin tested, and a good individual. Sire is a son of Pietertje Maid Ormsby 35.56 butter in 7 days, has full sister with record of 1,255.6 butter in 365 days, average per cent fat 3.95. Dam a 15 lb. 2-year-old granddaughter of King of the Pontiacs. For pedigree and picture write to Walcowis Farms, N. Dickinson & Son, Lake Geneva, Wis.

Registered Holstein Heifers

HEIFER CALVES AND YOUNG COWS for sale. Ten daughters of the 24.12-pound bull, Sir Korndyke Zoldusky DeKol, that has 10 A. R. O. daughters. He is a grandson of Hengerveld DeKol, that has 116 A. R. O. daughters. These heifers are bred to the 40-pound bull, Johanna King Segis, a son of the 40-pound cow, Johanna DeKol Van Beers. Yearling bulls and younger from A. R. O. dams with records from 14 to 30 pounds. High-grade springers and young cows. Write us your wants.

H. F. McNUTT OXFORD, WIS.

23-POUND HOLSTEIN BULL

BORN March 14, 1916. His dam is a 23-pound daughter of the noted "butter fat" sire, Sir Clyde. Her test is 4.23% fat. His sire is a 25-pound son of the 32-pound bull, Beauty Pietertje Prince, and whose dam is the double bred Ormsby cow, Queen Ormsby Duchess. Send for pedigree and price. Address

DOPP BROTHERS Ixonia, Wisconsin

AT LA BELLE VIEW FARM

ORMSBY-BRED Holstein bulls will not reach around; winter calves all sold. We now offer one born in March, dam made 21 lbs. butter in 7 days, 3.90% test, 6 nearest dams to sire tested 4% and better, sire is also first cousin to Duchess Skylark Ormsby (dairy queen of the world), average test for year, 4.24. Good test is some drawing card. Better investigate, our prices are low.

E. E. ROSENKRANS Oconomowoc, Wis.

10 YEARLING BULLS 10

EXTRA WELL GROWN, good individuals and nicely marked, all more white than black, sired by good sires and from heavy-producing dams with records from 19 lbs. to 23 lbs. Priced for immediate sale from $100 to $150. Don't wait to write.

W. H. G. RHODA, 610 3d St., Watertown, Wis.

THE WISCONSIN FARMER

VOL. XLVI. NO. 28. THURSDAY, JULY 12, 1917. WHOLE NO. 1850

THIS MAN CHOSE JERSEYS.

WHEN Fred Stubley took over his father's farm, just on the outskirts of Black Earth, he only had a few hundred dollars to pay down on it. Though the father was satisfied with this initial payment, he had certain definite ideas on how it would be possible for the boy to make the farm pay enough profit so that the land could be eventually all paid for. Being an old-timer, he had his doubts on the new enterprises that younger generations were undertaking.

When the boy, therefore, purchased three head of Jersey cows the following year, the elder

ONE OF FRED STUBLEY'S PROFITABLE JERSEYS.

Mr. Stubley was convinced that the farm was going to smash at top speed. He went to his banker and held a long conference for the purpose of securing the banker's help in stopping these uncertain ventures on the part of the young man. But the banker and the Black Earth State Bank officials were farsighted business men. They believed in dairying and they believed in Mr. Stubley, Jr.'s, ability to make dairying pay. So they told Stubley, Sr., that if ever he became convinced that the risk was too great to carry, they would be willing to take the matter in hand and finance it themselves.

FRED STUBLEY, WHO HAS MADE A SUCCESS WITH JERSEYS.

The father has never had reason to regret letting the young man have his way, for the three Jerseys soon developed into a fairly good-sized herd, and the milk and creamery receipts showed that the possibilities of dairying had not been overrated.

Today 100 head of young stuff and milkers form the herd. Twenty cows are always at work, that being the minimum number. During the fall season and through the winter the milking herd is larger, because more time can be put into the production end during this part of the year.

Soon after the first Jerseys came on the farm, Mr. Stubley and several other dairymen of Black

ANOTHER JERSEY WHICH HELPS MAKE THE HERD PAY.

Earth organized a farmers' coöperative creamery, which is still doing business. They had a few ups and downs, but on the whole the creamery company has worked to the satisfaction of the members during all these years. Greater interest is now being taken in dairying than ever

(Concluded on page 6.)

THE HOME AND FARM BUILDINGS ON THE FRED STUBLEY PLACE, BLACK EARTH, WISCONSIN.

FARM MECHANICS

Questions and Answers.

Voltage of Spark Coil.

How many volts will a high tension spark coil produce when operated by four dry cells?

Answer.—That depends upon the winding of the coil and the condition of the dry cells. You can test the voltage by seeing how long a spark the coil will produce. It takes 60,000 volts to produce a spark one inch long. A spark one-half inch long would represent one-half as much, or 30,000 volts.

Clutch Slips.

I have a 1917 Model Ford car that does not go into high as soon as the clutch is released. It will spin on low a while before it goes into high. When it has a hard pull it will slip out of high into low. What is the trouble?

Answer.—The clutch is not adjusted tight enough. To adjust it, proceed as follows: Remove the plate on the transmission cover under the driver's feet. Take out the cotter key on the first clutch finger and give the set screw one-half to one complete turn to the right, using a screw driver. Do the same to the other finger set screws. Be sure to give each the same number of turns and don't forget to replace the cotter key.

Oxygen and Acetylene Gases.

Kindly define the difference between oxygen gas and acetylene gas. Can oxygen gas be successfully used to decarbonize cylinders? Is it as good as acetylene gas for this purpose? Where can oxygen be secured?

Answer.—Oxygen can be secured from the Bettendorf Co., of Davenport, Iowa. It is an elementary gas; that is, it cannot be subdivided into other gases or substances. It does not burn alone, but supports combustion. Acetylene consists of two gases, carbon gas and hydrogen gas, combined in a certain chemical union peculiar to that gas. It alone would not burn, but mixed with oxygen it burns with an intense heat. Oxygen is used in removing the carbon from cylinders, but it is necessary to ignite the carbon.

Adjusting a Carburetor.

Please explain the correct adjustments of a Model H Holley carburetor used on a 1915 Model R Reo 4. We are getting only seven and five-tenths miles per gallon of gasoline. The low speed plug is turned about a quarter turn to the left. When the motor runs idle it will stop at times unless the air is shut off. The packing nut for the needle valve allows enough gasoline to leak out to keep the lower part of the carburetor saturated. The spark plugs seem quite sooty, but not enough to prevent even firing. Should the low speed plug be set with the prick punch mark at the top for ordinary driving speed, say twenty miles per hour?

Answer.—Unscrew the packing nut on the needle valve and pack it with any kind of valve packing or with cotton twine saturated with soap. This will stop the leak around the needle valve. This leak may account for a considerable portion of your low mileage per gallon of gasoline. Then adjust your carburetor as follows, the instructions being taken from a circular issued by the Holley Bros. Co.:

Open the adjusting needle one and one-quarter turns, start the motor, advance the spark slightly and open the throttle about one-third. Now turn the needle to the right cutting down the gasoline until the motor begins to slow up, back fire or missfire; then gradually increase the gasoline feed by turning the needle to the left until the motor picks up and reaches its best speed without much odor or black smoke coming from the exhaust. Now close the throttle and retard the spark to idling position and adjust low-speed plug until the motor runs smoothly without loading. The low-speed plug must be turned slowly to obtain the best results, and the amount of turning can be determined by the action of the motor, as it can be turned in either direction and accomplish the same results.

Power Line Interferes With Telephones.

The Iowa Railway and Light Co. have built a line through here to transmit electric current from one town to another. Our telephone line is on the opposite side of the road, the two running parallel for over a mile, only crossing once. At the point of crossing the telephone line is about ten feet below the power line. Why is it that when the power line current is flowing it affects the telephone line so that it is almost impossible to talk? Is there any remedy for this annoyance?

Answer.—The current in the power line induces a current in the telephone line that causes the interference. The only way to overcome this is to use a complete metallic circuit for the telephone; that is, using two line wires instead of one line wire and a ground wire. Both line wires should run on the same poles. The current induced in one wire will largely neutralize the current induced in the other. The power company should stand the expense if the telephone line was installed first.

Lighting a Ford Tail Light.

I wish you would publish a diagram showing how to put an electric tail light on a Ford car, Model 1917. I wish to wire the tail light so that the magneto will operate it.

Answer.—The figure shows how the wiring should be done. C is the coil box, the back of the box being shown

with all excepting the lighting wires removed. M is the magneto terminal on the coil box; S is the lighting switch on the dash; L L are the headlights; and T is the tail light. G shows the wires grounded at any place on the frame of the car. Use a two-candle-power or four-candle-power bulb for sixteen volts for the tail light.

Engine Overheats.

Please tell me why my Model T Ford motor overheats. It has done so ever since it was new, and it has now run 3,500 miles. I have kept the engine free from carbon. I have tried running the spark lever in different places, but this does not help. I have had the fan blades twisted as much as possible, and am running the fan belt extra tight. I have flushed the radiator and water jacket thoroughly. I also have a water circulator. I use Polarine oil. I usually run at a speed of about twenty miles per hour. The water boils before I have gone two miles. The car has plenty of power, and I have had the valves ground. I always keep plenty of oil in the crank case and keep the radiator full of water. The engine starts easy, and I have examined the brakes to see that they do not drag. The car runs smoothly.

Answer.—You have certainly gone into the matter very thoroughly. The above letter shows the proper way to locate the trouble where a motor overheats. The Ford motor has some tendency to overheat, due to the fact that it has a rather high compression. You may be running with too rich a gasoline mixture. If the mixture is too rich the flame coming from the exhaust ports of the motor will be red instead of blue, as it should be. The flame may be observed by running the motor with the exhaust manifold removed. Too rich a mixture also causes a sooty exhaust. One of the most common causes of overheating is running with the spark too far retarded. It may be that there is a fine or other obstruction in the water jacket of the motor, or a bunch of solder in the radiator that prevents the water from circulating freely.

Here's The Best Engine I Ever Made—My Patriotic Prices Save You Big Money!

Galloway Saves You On First and Last Cost with Best Engine Built

Don't be fooled on the engine question. Let Galloway post you on the secrets of engine making and selling. I'll tell you some engine facts in my book that will astound you. Learn the truth about engine claims and know all about heavy weight engines, light weight, four cycle engines. What horsepower, bore and stroke mean. Learn how to judge engines. Then see how dealing with me—Galloway the maker—you can save on your engine and get the type exactly suited to your needs. You cannot make a mistake after you read my free book.

It's My Masterpiece Engine

I call it that because that's exactly what it is. It has features (exclusive features), that make it the best engine ever made, bar none. Point for point—part for part—it excels every other engine I know—and I know them all. Test it—try it—any way for any kind of work—tough or easy jobs—and you'll agree with me that my masterpiece engine is a masterpiece in every sense. If you pay less than my price you skimp on quality. If you pay more, you pay too much.

I Guarantee the Biggest Engine Value in the World—Write and Ask Me to Prove It

Yes sir, the best engine—quality for quality—size for size—power for power—at the price. That's what I offer you in my Masterpiece Six. And I'll give you brand new, this-year engine improvements that are exclusively mine—cannot be had on any other engine but the Galloway. For instance, adjustable bearings, economy carburetor, valves-in-head, double ball governor, water-cooled cylinder head, automobile-ground valves.

Power Test On Your Own Farm

But you don't have to take my word, or anybody's word. You can try my Masterpiece Six on your own farm for a free power test if you want to. Let the engine—by the work it does for you—decide whether you'll keep it. Test it on easy, hard or medium work. It's all the same—but test thoroughly before you decide.

GET THIS FREE BOOK with Patriotic Prices

It tells everything you ought to know about engines. How to pick them out and why you should demand a heavy weight, large bore, long stroke and low speed. It also explains Galloway's direct-to-you plan of selling and why it means you get your engine at these patriotic prices at the time when the nation is calling for big crops. Write for the book today, sure!

CHOICE OF FIVE BUYING PLANS

It's easy to own a Galloway Masterpiece Six or any other size Galloway engine. My fair buying plans give you the terms you like and a power test on your farm. Send tonight for this book. Learn these engine facts, and facts on Separators, Spreaders, Tractors and other Implements. A postal will do. We ship from St. Paul, Chicago, Council Bluffs, Kansas City or Waterloo factories.

2-Cylinder Cushman Engines

FOR SILO FILLING

8 H. P. 2-Cylinder Weight Only 320 lbs.

Lester Jensen, Ogdensburg, Wisc., writes Feb. 2, 1917: "Last September I purchased a 15 H. P. Cushman Engine to run a No. 13 Blizzard Cutter in filling our silos. It did the work. Running the ensilage cutter at full capacity for 10 hours required 10 gallons of gasoline. Only slight attention was necessary from the man doing the feeding at the cutter.

"Since then we have been using the engine to run a feed grinder all winter. By filling the water jacket with hot water and using the handy gasoline priming cups on each cylinder, I was able to start this 15 H. P. Cushman in any kind of weather with one or two turns of the flywheel. The **easy, quick starting** of the Cushman is an important advantage."

4 H. P. on Corn Binders and Potato Diggers

The 4 H. P. Cushman, weighing only 190 lbs., is the one engine that may successfully be attached to Corn Binders and Potato Diggers, saving a team, reducing the wear and tear on the machine and securing better results. Write for circular explaining how they are attached to these as well as other field machines. The same engine may also be used for all other farm work, being so light in weight that it is easily moved around from job to job.

Very Steady and Quiet

Cushman engines run very steadily and quietly, like high-grade automobile engines. No loud explosions or fast-and-slow speeds.

The All-Purpose Engines

Cushman Engines are the All-Purpose Farm Engines, weighing only about 40 to 60 lbs. per H. P. — about one-fourth what ordinary farm engines weigh. 8 H. P. 2-cylinder weighs only 320 lbs. Besides doing all other jobs it may be mounted on Corn Pickers and Hay Balers. 15 H. P. 2-cylinder weighs only 780 lbs.

Cushman Engines have **Throttle Governor, Schebler Carburetor** and **Friction Clutch Pulley.** They are not cheap engines but are cheap in the long run. Ask for book on Light Weight Engines.

Cushman Motor Works, 855 N. 21st St., Lincoln, Neb.

DITCHES and Terraces

Also grade roads, build dykes, levees with Martin Farm Ditcher and Grader

Works in any soil. Makes V-shaped ditch or cleans ditches up to 4 feet deep. Does labor of 100 men. All Steel. Reversible, Adjustable. Write for free book and our proposition.

Owensboro Ditcher & Grader Co. Inc. Box 224 Owensboro, Ky.

THURSDAY, JULY 12, 1917.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

THE GRAIN BELT'S PATRIOTISM.

I AM well within the bounds of fact when I say that not in a generation has there been a Fourth of July such as that of Wednesday of last week. Celebration gave way to consecration; hilarity and noise to serious thought and prayerful contemplation. The spirit of the day was that of Lincoln's Gettysburg address and the people of the nation met, with almost religious fervor, to dedicate themselves to the great task before us; to take increased devotion to the cause for which our heroes will give the last full measure of devotion; to highly resolve that the dead shall not die in vain and that this nation and all the nations of the earth shall have a new birth of freedom; that government of the people, by the people and for the people shall not perish from the earth.

What little remained of sectional lines in this country, after the Spanish-American war, has been completely obliterated in the common effort for the common cause of liberty, democracy and peace. There is no longer a South or a North, an East or a West—it is all America, one country, one flag and one purpose.

A few months ago I discovered, in my general reading, that the eastern papers, with their customary provincialism, were greatly concerned over the patriotism of the West. Because we of the central West did not join in their hysterical fears of a fleet of Zeppelins raiding Boston, or of submarines shelling New York City; because we of the grain belt did not protest over and over our willingness to see the issue through and our loyalty to the stars and stripes, our eastern cousins became greatly perturbed for fear we might fail to do our duty. Today, I am glad to say, all this is forgotten; the West is doing what everyone (except those residents of the Atlantic seacoast who regard Buffalo, N. Y., as "way out west") knew she would do. The West far surpasses the East in voluntary enlistments for military service; in our proportionate subscription to the liberty loan and in our share of Red Cross subscriptions. The figures just given out show that among the first seven states which exceeded their share of Red Cross subscriptions, only two (Delaware and New York) are east of the Allegheny mountains, while of the remaining fifteen, five or one-third (Illinois, Iowa, Nebraska, North Dakota and South Dakota) are among the ten grain-belt states of the central West.

Considering these facts, it is not to be wondered at that the eastern press has begun to calm its fears that the West is not still in the Union. As I have formerly said, I have no inclination to draw comparisons at this time, for patriotism is not to be measured by census statistics or by dollars and cents. It is to be gauged only by heart throbs, by ideals and by courage, and there is no counting machine which will record these sentiments. But I merely wish to call the attention of our eastern cousins to the fact that they can, with perfect safety, devote themselves to putting their own room in our common dwelling-place in order and leave us here in the West to bear the load of our own responsibilities.

The minute men of Concord and Lexington were the embattled farmers who "fired the shot heard 'round the world;" it was the farmers of the middle West who left the fields to be tilled by the women and children and turned the tide of defeat to victory in the dark days of the civil war; it was the West that furnished the largest quota of troops in the Spanish-American war, and it is the Central West that will bear the heaviest brunt of the burden, whether in providing supplies or men, that will finally save the world for democracy on the blood-stained fields of Europe.

Let us hear no more of eastern or western patriotism, but only of American patriotism.

OPENING OUR HEARTS AND PURSES.

I HAVE called attention elsewhere on this page to the attitude, until quite recently, of the eastern press, which looked askance on the patriotism of the West and assumed a "holier than thou" attitude toward us in the matter of loyalty. Since writing the article entitled "The Grain Belt's Patriotism," I have received such tangible, indisputable evidence of the grain belt's wonderful patriotism and generosity, I cannot refrain from passing it on to you as conclusive refutation of the baseless charges of the eastern press.

My very good friend, Mr. Frank Dunning, president of the Citizens' Bank, of Bedford, Iowa, a man to know whom is to love, the very elect of this earth, has reported to me the result of the solicitation of a Red Cross committee in one-half of one of the townships of the county where he lives: a typically agricultural and rural county of the grain belt, without a town of more than 2,000 population in it. The township on which Mr. Dunning reports does not contain a single postoffice, it is rural all the way through. Moreover, while there is a high general average of farming prosperity, there are no wealthy men in the township. It is made up of good, honest, well-to-do farmers who do their work well, rear their families in the fear of the Lord and are loyal, patriotic Americans ever and always. Let Mr. Dunning tell the story of how he went among them soliciting Red Cross subscriptions and of the reception he met:

My Dear Mr. Pierce:—The statement made in some of the eastern publications that the West is not responding to the call for cash contributions in aid of the many worthy causes that have for their object the aid, comfort and physical and moral support of our army in the present war with Germany, should be most vigorously refuted. Such statements are made either with the design to misrepresent the facts, or are the result of misinformation.

Taylor county, Iowa, is a typical agricultural community of the Middle West, and the way in which her citizens are responding to every appeal of the government for financial aid in every worthy cause thus far advanced shows that she is not indifferent and lethargical, but interested and alert. As an example, a canvass was made in a portion of Ross township by a committee, of which I was a member, in the interest of the Red Cross War Fund, and every family visited (with the exception of three) contributed in sums ranging from $1 to $25. I am enclosing herewith a copy of the list, showing names and amounts. All of the contributors live on R. F. D. No. 5, out of Bedford, with the exception of three men.

The territory covered in this particular instance was the west half of Ross township, and practically every family was visited by the committee. All expressed interest in and anxiety for the cause. There is no town in this territory. The $50 basket collection at the head of the list represents a collection taken at the Hazel Dell Baptist Church, a country charge in the community. At a meeting held by a committee at the Siam country charge on Sunday there were sixty-one people present, and fifty-one of them, on being given the opportunity, paid the $1 and became active members of the Red Cross. The sum of $95 was subscribed for the war fund, made up altogether of subscriptions of $5 and more. At East Mission, another country charge in Clayton township, $120 was subscribed, there being three $25 subscriptions and the balance $10 each, the smaller subscriptions being left for the committee to secure.

A thorough canvass of one-fourth of one township in Adams county, just north of us, resulted in a total subscription of $369, and there were only two $25 subscriptions. There are no towns in any of the above territory.

Taylor county's apportionment of $7,500 in aid of the Red Cross will be oversubscribed, as was its allotment in the cause of the Army Y. M. C. A.

These things indicate that when a thorough canvass is made in the interest of a worthy cause, the people of the Middle West respond quickly and liberally.

Sincerely yours,
FRANK DUNNING.

This splendid report from Mr. Dunning fills me with rejoicing. It comes from a section of the country where I made my home in the early days of my residence in the grain belt, after I left Ohio, as a mere boy. Many of the names are familiar to me; I knew the fathers and the mothers of these liberal givers back in the days when I was beginning my newspaper work, among these grand people. It is like getting a cheering letter from home to read these names and to see the magnificent manhood and womanhood responding to the call of humanity in this manner. I cannot refrain from printing the names of these donors in the western half of Ross township, Taylor county, Iowa, as Mr. Dunning sends them to me. There are sixty-one names altogether, not counting the donors to the basket collection at the Hazel Dell Baptist Church. All but three of the sixty-one live on one rural route running out of Bedford. Let me print the honor roll:

Basket Collection at Hazel Dell Bap. Ch.	L. R. Helm	Elmer Derrickson
rs. F. E. Gaddis	J. W. Lacey	John Tribolet

B. D. Toll	Delbert Jared	Wm. Kinney
	A. J. John	E. L. Oxley

Here is splendid refutation of the oft-made charge that we of the grain belt are not opening our hearts and our purses to the country in its hour of need. By this morning's paper I see that the state where the good people named above live (Iowa) heads the entire nation in the number of Red Cross chapters, having two more than New York, although New York's population is four times Iowa's. Nothing could more conclusively prove that the grain belt, the agricultural sections and the individual farmers are standing behind Uncle Sam, the president, Old Glory and the soldiers and sailors, as one man, wholeheartedly devoted to the cause of humanity, determined to keep the world safe for democracy.

EXEMPTION FOR FARM BOYS.

PURSUANT to my promise of last week to announce the government's plans for drawing the new army, I will outline herewith the particulars as they were given to me within the last few days. I feel that this is a subject of general interest, for I am not exaggerating when I say that I have received hundreds of letters (many of them so moving as to bring tears to my eyes) from farm mothers, who hope to save their boys from conscription, and from farm boys, who believe they will be serving Uncle Sam better on the farm than in the foreign trenches. To all of my correspondents I can say that the situation is brighter today than ever before.

First and most important, I am glad, indeed, to be able to say, there is repeated evidence that the government proposes to exempt the farm boy, wherever and whenever the circumstances point to his being useful on the farm to carry on the work of tilling the soil and harvesting the crops. Special regulations for his exemption have been made. While the farm boy will not be exempted merely because of his occupation, his case will be heard by a special tribunal, vested with ample authority to exempt him if the circumstances warrant. Let me go into detail a little.

The names of 1,000,000 to 1,500,000 young men will be drawn, in a few days, from the lists of 10,000,000 who registered on June 5th. Exemption boards have already been appointed, one for every county of less than 45,000 population or city of 30,000, with additional boards, where necessary, for each additional 30,000 population. Thus, Waukesha county, Wisconsin, having a population (according to the 1910 census) of 37,100, will have one exemption board; while Fond du Lac county, having a population of 51,610, will have two exemption boards. These local boards will have power to exempt the physically and the morally unfit and those having someone dependent upon them. I might add that the farm boy who is the sole support of a widowed mother, or an aged and infirm parent, or an orphaned brother or sister under sixteen years of age, or a wife or minor child, will be exempted by these local county boards. But if a farm boy has no such dependents and still wishes to be excused from army service, there remains another recourse for him.

Above the local exemption boards in authority there will be district exemption boards, one for each federal judicial district. This means one each in Kansas, North Dakota and South Dakota; two each in Minnesota, Wisconsin, Missouri, Oklahoma, Nebraska and Iowa; and four in Illinois. Appeals may be made from the decision of the county and city boards to these district boards. But agricultural exemption is to be decided by these district boards alone, the local boards having absolutely nothing to say on this subject. The farm boy, therefore, who claims exemption on the ground that he is needed to bring the corn crop through to maturity, or feeders to the market, must present his claims to the district board of his state. If the board is convinced that he is a hard worker, and that farm production will suffer if he should be taken away, it will exempt him and that will end the matter; if it says "No," there is no higher court to which to appeal, the matter is likewise ended.

I have good reason to believe that farmers will be well represented on these district boards, so the outlook is far from dark. I shall have more to say on this phase of the matter within a week or two. In the meantime, my advice to all my correspondents and to all interested is this: "Keep a brave heart and do not despair; Uncle Sam realizes that he needs his farm boys on the farm and he is not going to take advantage of anyone." With this knowledge in our hearts, let us face the future hopefully, convinced that all will come out right in the end.

THE WISCONSIN FARMER, Madison, Wisconsin

Rural Carriers at Sturgeon Bay.

Every day a representative of Uncle Sam passes the farmer's door. We refer to the rural carrier. He is always on the job no matter what the weather. He represents a service which the farmer appreciates and which he desires to have continued on an efficient basis. The Wisconsin Farmer was represented at the carriers' convention in Sturgeon Bay last week and attention of our readers is directed to another page where a review of some of the important points brought out at this meeting is published. The rural carrier asks for no taffy or high-sounding praises. He asks a chance to work and to do his work right and to get fair pay. The state organization is social in character and in addition it has for its object the improvement of the service. The carriers do not meet as a grievance committee, but, on the contrary, meet to discuss constructive measures for the benefit of all of us. The rural carrier, before the present war is over, may become a forceful agency in aiding the government. If he is called upon he will do his duty. The Wisconsin Farmer is glad to note that the carriers had a good meeting at Sturgeon Bay, in the cherry country, and we hope that much benefit may result from this session.

Urgent Need to Increase Live Stock Production.

It is very natural that there should be much agitation in the central West of increasing live stock production. In this area natural conditions are more favorable to the industry, because we are enormous producers of both grain and roughage. From the West comes the same cry and Mr. R. W. Clark, of the Colorado station, urges that the flocks and herds be increased in numbers. He points out that animal products such as mutton, beef and pork are very high in price, so high that the question is often asked: "Will prices continue high?" They may not continue as high as at present, but they are bound to continue a great deal higher than they were when the war began.

Previous to 1914, we had an increasing population and a decreasing animal production. From 1910 to 1914, the population of the United States increased 7 per cent, while sheep decreased 5 per cent and cattle 10 per cent. Hogs in the same time increased only 1.2 per cent. If war had not come, prices would have increased, although not as much as they did. Animal production has been reduced or destroyed throughout the whole of Europe and the English colonies. Years will be required to reëstablish the herds and flocks after the war ceases.

A few years of good crops will produce a great grain surplus, but this is not true of live stock. Hogs produce at one year, but better at two; sheep at two years, but better at three; and cattle at two years, but better after three years of age. Farmers are reluctant to increase their live stock; it is a slow process and requires considerable capital and experience. Grain raising gives quick returns and is more attractive to the average farmer.

There is no danger of prices being low for a great many years. The nations of the world will be in the market for breeding stock when the war ceases, and no matter how high prices may go, people must have meat, milk, wool and all that is made from the pelts and hides. Furthermore, so serious is the condition that legislation will probably be provided to prevent price setting and to stimulate production.

Aside from profits, farmers need to engage in animal production. The fertility of the soil must be restored and maintained; there must be a better division of labor on the farm throughout the year than at present, and to be more prosperous, the farmers must have a regular monthly cash income. These conditions can be brought about only by live stock and the country will not be most prosperous, and especially the farmer, until they prevail.

Encouraging Wisconsin Settlers.

The Wisconsin Live Stock Breeders' Association has issued a lette to prospective settlers from which we quote as follows:

The opportunities for profitable live stock production are numerous in Wisconsin. In fact, there is not a state in the Union better adapted by nature to this important and necessary branch of farming; in few are the farms so conveniently near the great markets of the country and in none is more done by the state and coöperative agencies to encourage the raising of those classes of live stock which will return the producer or stockman the most substantial profits.

Community breeders' associations numbering 111 have already been formed in fifty-one counties of the state. Each of these coöperative organizations is helping the stockmen of the respective counties in the improvement of their herds, studs or flocks, in the purchase of breeding stock and by creating centers to which buyers may go in search of any one class of farm animals, is assisting their members, and others, in disposing of their surplus at better prices than would otherwise be possible.

Similarly, through the formation of cow-testing associations, Wisconsin farmers and dairymen are enabled at a very low cost to "weed out" their unprofitable cows and to more economically feed their herds.

We send you this information for the reason that we believe, as a prospective settler, you will be interested in learning of the numerous agencies which are at work in Wisconsin to increase the profits to be derived from raising live stock.

Wisconsin is very much alive agriculturally, and all the agencies already mentioned are at the service of settlers in the cut-over sections of Upper Wisconsin, as well as of the farmers in the more thickly settled portions of the state. The work being done by these organizations means greater prosperity for all. We will gladly furnish additional information concerning the work of these associations and clubs, or place you in touch with the secretaries in the section of the state in which you are interested.

This is a great year for buying land. Our Wisconsin people should not overlook the opportunities in their own dooryard.

Our Share in the Liberty Loan.

Perhaps some of our readers have thought that the large advertisements of the Liberty Loan which appeared several weeks ago in The Wisconsin Farmer were paid for, and that this paper was getting a part of the revenue from the sale of the bonds. The letter which is published in part herewith, shows that The Wisconsin Farmer donated almost $700 in advertising space to the Liberty Loan campaign, not receiving a cent for this service. We may add that this donation was given gladly. Neither did the publisher of The Wisconsin Farmer nor his associates feel that this donation of advertising space relieved them of any further responsibility. On the contrary, they bought bonds just the same as they would have done if they had given no advertising space. And we were doubly glad of an opportunity to give a great deal of space to the subject of Liberty Bonds in out editorial columns. This space, of course, is not for sale at any price. Chairman John H. Rich, of the Federal Reserve Bank of Minneapolis, who is also federal reserve agent, writes to the publisher of The Wisconsin Farmer under date of July 2d as follows:

The final totals of the Liberty Loan subscription in the ninth federal reserve district have just been obtained. The subscription is $70,223,100 which, in view of the extent of the district and the fact that it is largely agricultural, which has necessitated an immense amount of advertising and organization work, is very satisfactory, and represents a response which is in keeping with the importance and dignity of these states.

In behalf of this committee, which has been acting under the instructions of the secretary of the treasury, I beg to express our sincere thanks for the donation of advertising space which you have made, amounting to 1,746 lines, and to acknowledge your contribution of the cost of the same amounting to $698.40, and as well, the amount of reading space that you have devoted to this subject. Your action was of material assistance in the flotation of the loan and I want to thank you for the interest and practical patriotism which prompted it. In carrying information to the rural districts and towns, no part of our work has been more effective than that handled by the newspapers in their display advertising, their editorials and their news comments.

The committee appreciates the assistance received and is of the opinion that without this help it would have been extremely difficult, in view of the great area of the territory under its charge, to have brought adequate information to people of this district in time to permit them to make their response before the close of the campaign.

Again expressing our appreciation of your patriotic service, very truly yours, Central Liberty Loan Committee, by John H. Rich, Chairman.

Our readers may well imagine that this is a letter which we will prize very highly. The Wisconsin Farmer is glad to have had an opportunity to do its part and is ready for still further service for Uncle Sam.

Fond Du Lac County Activities.

From June 25th to 30th R. V. Gunn, emergency county agent for Fond du Lac county, and D. S. Bullock, of the State Live Stock Breeders' Association, toured Fond du Lac county and held meetings at Empire, Rosendale, Ripon, Alto and Calumet Harbor. The purpose of these meetings was to encourage still more raising of larger numbers of better live stock. Mr. Bullock gave an illustrated lecture at each place showing the types of live stock worth having and Mr. Gunn spoke for more silos and a conservation of the crops in general. There are approximately 2,000 silos in the county. This apparently makes a proportion of one silo to every two farms, as there are 4,000 farms in the county. Since many farmers, however, have more than one silo on their place it is certain that the proportion would be more nearly one to three. Mr. Gunn is convinced that a greater number of the farms in the county have sufficient stock to warrant a silo. Of twenty-one towns which have been petitioned by him to gather figures on the number of silos in their community, ten have reported that a total of nearly 300 farms are without any silo at all. A recent survey by Mr. Gunn shows that there is an increase of 7.3 per cent in the number of acres which have been planted to corn this year. The increase warrants an increase in silos also.

Although Mr. Gunn has only been in the county a short time, his work is being appreciated and he is in demand at every breeders' meeting and community meeting held. During the past month the Holstein, Guernsey and Jersey breeders have held their summer meetings and he has talked to nearly 1,000 people at these three meetings alone.

Taking soil samples or running a level for a drainage layout are all the same to Mr. Gunn, and, though there are hardly enough hours in the day to take care of all the matters that come to his desk and call for his personal attention, he is on the go as long as it is daylight and then puts in his evenings getting ready for the next day.

Besides his work with the farming interests he also has a part in the activities of the women of the country. The county has been divided into four districts under Miss Frances Perkins, who oversees the domestic science work of each district. A domestic science teacher for each of the four districts consults with her as to the work for each community and reports to Miss Perkins the work done by the various clubs and women's associations. These clubs include the canning and food conservation work that is done in the county. In the city of Fond du Lac seven of the nine schools in the city will be used by the city women for the canning work. The County Council of Defense furnishes the gas necessary for the cooking. Steam pressure cookers have been purchased by the women of the clubs and the necessary vegetables will be donated from the various gardens.

A bulletin board in each of the schools will call attention to food conservation and on it will be posted recipes and hints on how to use substitutes for various materials now in use. The women are encouraged to copy these and use the suggestions in their own homes. The women of the city have also spread the gospel of organization to the country and twelve new canning clubs have been formed during the last two weeks.

It is the desire of Fond du Lac county men to have the best organized county and defense council in the state. Their efforts so far have proved they are working in the right direction. Behind every movement or ably seconding it is the chamber of commerce represented in the person of J. J. Ermatinger, its secretary. Mr. Ermatinger has great things in mind, not only for the city of Fond du Lac, which he is serving primarily, but also for the live stock interests of the county. The pure-bred work in the county is attracting more attention over the state each year and the Fond du Lac men feel there is a great opportunity for both the city and the county to become the best-known farming center in Wisconsin.

The Winterkilling of Alfalfa.

There are many shabby looking alfalfa fields all over the central West and, of course, thousands of fields were plowed up and put in corn. The individual who sustained a loss of a field or two is not very much concerned about the question of his loss. He knows in a general way that the winter was too cold and the crop did not have enough snow protection. The strange part of the matter is, however, that some fields escaped. Others were half killed, while still others were completely destroyed. This is well illustrated in a letter by C. S. Burgess, which recently appeared in Field's "Seed Sense." It reads:

In reply to "What killed alfalfa?" I will try and tell you of a few fields in this community. I have three small fields of old stands; the oldest about thirty years, one ten and one four. There is some dead in all three fields, but more in the ten-year piece than in the other two combined. Another field just across the road on clay banks and bottom of draw is a piece nine years old that is nearly all dead and about forty rods farther on is another field on same kind of ground, three years old, that is a good stand. On the next eighty east of here are six acres ten years old, on good level ground, of rich loam, that is all dead. A short distance farther is ten acres, sowed last year, that is a perfect stand. All fields sowed in May without a nurse crop. None of these fields were pastured and all are well drained. That is, there is no water standing on them. I have talked with several farmers about their alfalfa and most say it is about half dead. I don't advance any reason, nor have I heard anybody that could give a cause for the conditions around here. But what killed the salsify and wheat and most of the parsnips has proved to be mighty hard on alfalfa. These are the condition in this part of Nebraska.

It is singular, indeed, that the thirty-year-old alfalfa field suffered less in the case cited by Mr. Burgess than one that had been established ten years. On the whole, the oldest field suffered most. We have in mind one instance where alfalfa, seeded five years ago, was practically all killed, whereas another two-year-old adjoining field, with a soil exactly similar, came through the winter in splendid shape. The experience that alfalfa growers have passed through indicates that the common variety is not absolutely hardy, and sooner or later we will have to use the Grimm variety. To be sure, there is not enough seed of that variety to answer the immediate needs of all who wish to establish alfalfa this year, but it is not too early to begin giving it a try-out on a small scale.

NEW LAWS OF INTEREST TO FARMERS.

The Badger Legislature Has Passed a Large Number of Acts Which Will Govern Farmers and Breeders of This State.—Altogether 600 Bills Passed.

THE 1917 legislature during its session considered nearly 1,500 bills, of which approximately 600 have been enacted into laws. The agricultural work considered by the senate and assembly during the session just passed contains some of the most important legislation for Wisconsin's agriculture that has been passed in recent years.

Heading the list is the tuberculosis legislation which has been encouraged by educators and breeders for many years. The Wisconsin plan of eradicating tuberculosis will, if followed out as proposed, place Wisconsin so far ahead of every other state in the Union as regards health in cattle that the state will be the mecca for pure-bred breeders of the United States in a greater measure than the most optimistic of us can anticipate. The plan of eradication provides for the complete clean-up of the state by areas, the isolation of reactors, pasteurization of their milk under state supervision or in case of slaughter a compensation not to exceed $100. The necessary authority for the enforcement of precautionary measures has also been incorporated in the laws. Any person moving animals afflicted or previously exposed to contagious or infectious diseases, including tuberculosis, is liable to a fine in case he transports such animals without the permission of the department of agriculture or the state live stock sanitary board. After an area has been cleaned up, as, for instance, a county or two or three counties, no uninspected animals can be brought into this county or counties under penalty of a fine and on the second offense imprisonment and fine.

The work of eradication will of necessity take years before it will be completed, but the beginning will be made shortly and a county or two counties cleaned up during the present year. The cleaning up of any area, however, will not be forced upon the people, as the law specifically states that such work is only to be begun in districts where one-half of the resident farmers and cattle owners request it.

For the prevention of hog cholera in the state the legislature has appropriated $2,000. This work will be done by the state veterinarian.

The state department of agriculture has been entrusted with the control work of animal and plant diseases and the police functions transferred from the university department of agriculture to the state commissioner of agriculture. It has been felt for a long time that the educational work of the college men was being hampered by the control work which at various times called for the application of police powers. Though such police powers were never employed except in the quarantining of herds that were a menace to a community or in preventing shipments of diseased nursery stock, the feeling aroused very frequently hindered later work of the college men along educational lines. Under the new system the commissioner of agriculture will take care of any control measures and the college men will continue the educational work without any handicap as formerly. Commercial fertilizer analyses and the stallion registration work are included in this transfer of control powers. Inspection of nurseries and nursery shipping stock, prosecutions of unreliable fertilizer concerns and violations of the statutes in regard to transportation of animals will all be handled by the department of agriculture in the future.

In order to have a better check on the agricultural resources of the state the legislature has enacted a law which will make it the duty of assessors of the towns and counties of the state to collect such statistics in relation to the principal farm products and agricultural resources as the department of agriculture may require. These statistics will be gathered each year when the annual assessments are made. A tabulation of the statistics must be forwarded by the assessors before July 15th of each year.

Of six bills introduced for the eradication of weeds or their control only two were accepted and made into laws. Under the law now a competent person is appointed by the chairman of each town board before the 15th day of May, whose duty it is to report concerning the noxious weeds in his district. Cases where this work has been neglected must be reported to the chairman of the town board, who, between the 1st and 15th day of August, must report to the commissioner of agriculture. The commissioner reports such failures to the proper district attorney, who will prosecute to recover the penalty for such violations. Threshing machine operators must also take all proper precautions that their machines are reasonably clean from all noxious weed seed before removing the machine from one farm to another.

Northern Wisconsin was benefited by the land-clearing bill, which provides for investigational and demonstrational work on the part of the university to determine the most efficient and economical methods of land clearing. This year's work is to start on July 16th and will continue for fourteen weeks under the direction of F. M. White, professor of agricultural engineering at the university. Besides experimenting with the best mechanical means for pulling stumps the demonstration trains will prove the possibility of clearing land quickly and economically and serve to attract settlers to the rich cut-over sections.

A settlers' reclamation department has also been established under the direction of the commissioner of agriculture. Whenever twenty-five settlers of any county petition the county board for funds for the reclamation of agricultural land by drainage or by removal of stumps, brush or fallen or standing timber, such funds shall be raised by appropriation, tax levy, loans or bonds not to exceed $100,000. These funds will be deposited with the state treasurer to be loaned under the supervision of the department. Persons owning forty acres or more of cut-over stump land and actually occupying such land or intending to occupy such land within a year and who intend to farm such land for at least five years can have five acres cleared, stumped, brushed or otherwise improved for the plow each year for a period of three years, making in all a total of fifteen acres which one settler can have cleared with state aid. Counties desiring to benefit from this reclamation act must, if they have not already done so, employ a county agricultural representative who is to aid in the work of agricultural development in the county.

The legislature also passed a measure empowering the department of agriculture to purchase dynamite and other explosives for distribution at cost to bona fide settlers of northern Wisconsin. The department of agriculture is instructed to make such rules and regulations as may be necessary to handle the orders for such dynamite and for its distribution.

County agricultural agent work has been helped along by the present legislature and the number of agents now possible for Wisconsin for which appropriations have been made are twenty-eight. This does not pertain to the emergency food agents which have been engaged this year by counties having no regular agricultural representative. The agents here referred to are the permanent representatives employed by the counties and financed with the aid of the state.

The dairy and food commission has had its duties increased through the laws that have been created this year. Besides the regular inspection work of the milk and cream supply and the dairy products in general the soda water industry and the baking interests of the state have been turned over to this department. The dairy commissioner has been given the right to appoint special dairy and food commissioners for any factory or plant buying or receiving milk and cream for manufacture into butter or cheese or for condensing or for retail trade. When two-thirds of the patrons of any factory or plant petition in writing for such a special inspector and guarantee the expenses and salary for such a man the dairy and food commissioner can appoint a qualified person with power to enfore the laws conferred by the state upon all dairy and food inspectors. The dairy and food commissioner has supervision over all the work done by this special inspector. The special inspector shall supervise and inspect the weighing and testing of milk, cream, butter or cheese and may perform such other duties as he has contracted for or which the dairy commissioner asks of him as long as they pertain to the inspection work.

The state dairymen's association was granted an appropriation of $6,000 annually for carrying on the cow-testing work and for encouraging better dairying.

The unfair discrimination in buying milk, cream and butter fat as heretofore practiced in certain cases where competition was especially keen between corporations has been made unlawful. Wherever a plant or corporation in order to create a monopoly or to destroy the business of the competitor discriminates between sections or towns in the state by buying such milk or cream or butter fat at a higher price in one section than is paid by the same plant in another section, after making due allowance for the difference in the cost of transportation, such a plant is liable for violation of the law.

"Whey butter" must from now on be conspicuously stamped or marked in letters at least three-eighths of an inch square upon two sides of each and every tub or package containing whey butter under penalty of a fine not to exceed $100. The legislature defined whey as the product remaining after the removal of fat and casein from milk in the process of cheese making. Whey cream is that portion of whey rich in milk fat which is separated from the whey and contains no less than 18 per cent of fat. The making of whey butter originated in the Swiss cheese districts where the loss of fat in the whey has been greater than in other sections. Whey butter has been marketed in many instances as first-class butter and it is to make this impossible that this law was enacted.

The lawmakers also established a standard of grades for apples grown in the state. There are now four classifications for Wisconsin apples: "Wisconsin Standard Fancy," "Wisconsin Standard A," "Wisconsin Standard B," and "Wisconsin Unclassified." These standards apply to all apples which are sold in closed packages. Apples packed under the law in closed packages must have on the outside the name and address of the person for whose authority the apples were packed, the name of the variety, the grade of apples and the minimum size or numerical count of the fruit in the package. Apples packed and branded in accordance with the United States apple grading law are exempt from the provisions of this section. Only packages offered for sale or consigned or shipped for sale must be branded in the manner prescribed. Enforcement is vested in the commissioner of agriculture.

The acts of the county board of supervisors of any county containing a city of the second class relating to appropriations to any county fair association have been legalized by the legislature, even when such appropriations have exceeded the limit provided in previous sections pertaining to county fairs. All associations which held fairs during 1915 and which filed their statements in the proper form before March of this year have been allowed the amount of their claim as far as such societies were entitled to state aid.

A bill introduced in the legislature for a state brand for our dairy products was defeated, but a resolution introduced by Senator Skogmo during the early part of the session has resulted in the creation of a committee to investigate a system of branding and marketing farm products. This committee will also study coöperative enterprises and submit plans for aiding and developing these for the best interests of our agriculture; it will investigate land and credit systems and auditing and accounting systems; it will examine into the systems of marketing, standardizing and branding of farm products. Two senators and three members of the assembly have been appointed to carry out the provision of the resolution and report to the next legislature. The committee is composed of Geo. B. Skogmo, of River Falls; Anton Kukuck, of Shawano; Henry Grell, of Johnson Creek; Chas. D. Rosa, of Beloit, and Riley S. Young, of Darien.

The state board of health was granted additional powers to deal with the location and construction and operation of rendering plants where carcasses of dead animals are disposed of. Under the law they can inspect and remedy all methods of operation which are a menace to public health.

The State Council of Defense created by the legislature was given additional powers in a bill passed at the close of the session which will make it possible for this council to seize foodstuffs and other property when, in its opinion, such foodstuffs and property are required for common defense or for the general public's welfare. It has also the power to fix the compensation which the individual or corporation whose foodstuffs and property are seized is entitled to. Not only foodstuffs can be seized, but also warehouses, buildings or storage facilities which may be required in order to serve the purpose of the state. The state council can store, handle, sell or distribute as it sees fit the property taken. All foodstuffs or properties taken by the council will be paid for by the council and in case of any dissatisfaction an appeal can be made in the courts for a readjustment.

Numerous other laws were passed only indirectly or very distantly pertaining to agriculture. Of interest, however, to the farmers of the state is the amended fire insurance law. Under the new provision all buildings must be paid for at the full value stated in the policy. Formerly an insurance policy contained the value of a building or automobile, but the companies were under no obligation to pay the full value of the policy. As a rule, an appraiser from the company made his estimate on the depreciation which had taken place since the policy was written and it was not an infrequent occurrence for a person whose barn had been insured for $2,000 to be forced into accepting $800 or $900. Hereafter the full value must be paid irrespective of depreciation or expert appraisals.

OF INTEREST TO BADGER FARMERS

IMPORTANT ACTS OF THE WISCONSIN GENERAL ASSEMBLY HAVE BEEN REVIEWED IN THESE COLUMNS FROM TIME TO TIME DURING THE PROGRESS OF THE SESSION. THIS ARTICLE GIVES MORE PARTICULAR ATTENTION TO THOSE NEW LAWS IN WHICH THE FARMERS AND BREEDERS OF WISCONSIN HAVE GREATEST INTEREST. TO FAMILIARIZE HIMSELF WITH CHANGES WHICH HAVE BEEN MADE IN THE LAWS OF THE STATE, EVERY READER SHOULD PERUSE CAREFULLY THE REVIEW GIVEN HEREWITH, AND IT MIGHT BE WELL TO PRESERVE THE SAME FOR FUTURE REFERENCE.—EDITOR.

THIS MAN CHOSE JERSEYS

(Continued from page 1.)

before. A test association was recently formed which includes 500 cows of Black Earth and vicinity. The first report for the month ending May 18th shows that Mr. Stubley has six cows of the eleven giving over forty pounds of butter fat in thirty days. The tester takes care of twenty-seven herds in the association, testing each herd once a month and also making regular tests of separators to see that they skim as they should and that no butter fat escapes through the skim-milk spout. "Guest" cows can soon expect an invitation to leave from their various boarding places when the full figures for the first few months' work are compiled. Twenty cows of Mr. Stubley's herd average over thirty-six pounds of butter fat for the month. This is highly satisfactory, considering that this represents the entire herd under test.

Mr. Stubley began by buying recognized producing stock and he has developed a considerable number of fine animals himself. Several years ago he imported fourteen cows from the Jersey Island, securing some excellent individuals with which he has since improved and strengthened his herd. His herd sire at the present time is Golden Maid's Viscount by Golden Maid's Prince. He is an imported bull with a deep, long body, wide chest and a typical Jersey head—broad at eyes with small horns set high, and with the dished face and broad muzzle. He carries out especially well over the back. His dam traces back to the blood of Golden Lad, famous in Jersey history. Another bull which has done much toward improving the heard is Bluebell's Eminent, a half brother of Noble of Oaklands, one of the best known sires of Jerseys in America. Some of the cows which have been showing well at the pail are Mint Drop, Double Time, Kilda Girl, Glory, and Rose. Kilda Girl has 600 pounds of fat to her credit for the year's work and after eight months' milking she gave, during the recent cow-test work, forty-nine pounds of fat. She is by Royal Majesty. Mint Drop gave, during the thirty days ending May 18th, 48.5 pounds of fat, Rose yielded 44.5 pounds of fat and Glory yielded 42.6 pounds of fat. Another cow not milking at the present time is Canary's Bluebell by Noble of Avaranche. Avaranche is a son of Noble of Oaklands, the $15,000 sire.

There are about 180 acres on the Stubley farm. Not only were the dairy cows able to pay for the original home place, but they have added another farm to the original one since their coming to Black Earth.

GOLDEN MAID'S VISCOUNT BY GOLDEN MAID'S PRINCE, IMPORTED SIRE AT THE HEAD OF STUBLEY HERD.

The silo was just a logical addition to the farm buildings when the dairy cows came. It has done good service through all these years and has helped to make the profit from the milking possible. More than $15 per cow is about the average income each month from the herd, which figures into a neat profit for a twelve-month period. Besides this, Mr. Stubley has the surplus stock to sell at good prices. The demand for Jersey heifers during the present season has far exceeded the supply.

Dairy cows are the money-makers, and the Stubley herd is just another of the thousands of proofs Wisconsin is ever ready to furnish any other state or community that has not realized this.

FEDERAL
DOUBLE CABLE BASE TIRES

If you've never used Federal Tires try them now. Without an equal for country roads. The non-skid treads are tough and durable, give perfect traction and hold the car safely to the road in wet or slippery weather.

No matter how hard or rough the going, Federal Tires always hold fast. For down in the base of the tire four strong steel cables anchor the tire safely to the rim against the hardest kind of strains. Yet they slip off easily when necessary.

Made in white Rugged and black Traffik non-skid treads. Sold by leading dealers everywhere.

Rural School Work in Polk County

UNDER the direction of County Superintendent of Schools Martin Stenerson and County Agricultural Agent John S. Klinka, some very profitable work has been done in Polk county by young people in keeping milk and butter fat records. This work has been carried on for over two years. Something over two years ago the boys and girls in the seventh and eighth grades tested a total of 1,072 samples obtained from 252 cows. In 1915 forty-two students tested 1,324 samples from 296 cows covering a period of six months each. The young people were provided with a special card on which space was arranged for the record of ten cows and blanks for morning and evening weight records, pounds of milk and butter fat per day and month, percentage of test, price of butter fat per pound, value of butter fat per pound with butter. While the young folks make up these cards, the work was supervised by the parents who signed the card.

During the month of October last year six agricultural school fairs were held in Polk county. One of these fairs was held in consolidated district No. 1, Apple River, in a new modern, two-room building recently completed and similar to fifteen other buildings constructed in Polk county.

In this building were grouped and displayed in most artistic fashion exhibits of cooking, sewing, fancy hand work and curios. Vegetables, grains and fruit occupied one larger room in the basement. In the beautiful maple grove on the grounds were exhibited horses, cattle of both beef and dairy breeds, sheep, pigs and poultry.

Special features were the Indian wigwam, Indian weapons, Indian hand work, brass and copper ornaments and utensils, old-fashioned weapons from Sweden and Norway and some beautiful and expensive drawn and woven work from Mexico. A fine old lady of the community carded and spun wool into yarn, a sight not often seen now.

The judging of the agricultural exhibits was done by Professors May and Clark, from River Falls, the cooking and hand work by the ladies of the Polk County Training School faculty.

At four o'clock those in attendance, estimated at about 200 people, partook of a bountiful meal prepared and served by the ladies of the neighborhood.

At eight o'clock in the evening a program was given which included talks by Superintendent Stenerson and Prin. C. W. Monty, and an illustrated lecture on live stock by County Representative J. S. Klinka. A business meeting followed to decide whether to purchase a piano, organ or a Victrola for the school. Following this was a meeting of the Equity Society.

The above gives an idea of the plan and purpose of holding these contests. The farmers are encouraged to bring samples of their products and are invited to come to the school. Much interest has been shown in these fairs wherever they have been held in the county. Similar fairs, on a larger scale, have been held in two of the villages in the county, namely, at Frederic and Milltown.

It has been Superintendent Stenerson's aim to secure a closer coöperation between the school and the home by interesting the teacher and pupils in active farm work and by encouraging work in the schools which will be of practical use on the farm. The plan has worked out splendidly and we doubt if any other county in the state has made more rapid progress in school work and school buildings than has Polk county. There are about thirty graded schools in the county and most of them are second-class schools located in rural districts giving special courses in agriculture, manual training and domestic science.

Students Man Tractor.

Working every daylight hour on land that would not otherwise have been plowed this year, four students of the college of agriculture are using tractors to advantage in helping the farmers of Dodge and Walworth counties solve the labor problem.

These students, who are now working in shifts behind the tractor at Juneau and Sharon, respectively, are Lester L. Pattinson, Darlington; C. E. Walsh, Eau Claire; J. H. Hill, Wyocena, and W. H. Ross, Milwaukee. The tractors are furnished and maintained on the job by a large food manufacturing company with headquarters in Chicago. This firm has condenseries at both Juneau and Sharon and is thus vitally interested in helping its farmer patrons make a good showing in food crops this year.

The plowing has almost without exception been done on old sod land or marshes, rough pastures and in other places that would probably not have been turned under with horse power. The boys are running in two shifts a day, taking thirty minutes daily for a thorough overhauling and inspection of their tractors, which are small, light-weight machines of about twenty horse power.

It is said that the plowing is being done at about $1.50 an acre. This price represents no profit and merely pays running expenses of the machines and the operators. The students have now been at work for at least a month.

"Farmers whom I have met are pleased with the work being done by the students and their tractor plows," said E. R. Jones, Dodge county emergency food agent. "Their work has been of great benefit to numbers of farmers, pushed to the limit as they have been to get the spring work done on time."

Grain Smuts

The U. S. Dept. of Agriculture recommends the use of Formaldehyde for cleansing seed grain before planting. It guards against the development of stinking smut and loose smut in wheat—

FORMALDEHYDE
The Farmer's Friend

The loss through smut in this country amounts to millions annually. This can be prevented by treating all seeds before planting with Formaldehyde solution. Pint bottles at your dealers, 35 cents, treats 40 bushels. Complete directions for using Formaldehyde, U. S. Dept. of Agriculture reports and hundreds of valuable suggestions in our big illustrated booklet sent free.

CURRENT EVENTS

THE United States expeditionary force to France, which arrived safely last week, was twice attacked by German submarines on the way over, but not a man, animal or ship was lost in the voyage. Considering the distance, the dangers and the difficulties, the feat of sending such a large body of troops abroad was performed in a remarkably successful manner. The details of the trip were not announced until the last ship (bearing horses and supplies) had reached a French port in safety, then Secretary Daniels, of the navy department, issued a public statement in which he said: "The transports bearing our troops were twice attacked by German submarines on the way across. On both occasions the U-boats were beaten off with every appearance of loss. One certainly was sunk and there is reason to believe that the accurate fire of our gunners sent others to the bottom. The whole nation will rejoice that so great a peril is passed for the vanguard of the men who will fight our battles in France. No more thrilling Fourth of July celebration could have been arranged than this glad news that lifts the shadow of dread from the heart of America." No announcement has been made of the number of troops sent over in the first army, but it will mount high into the thousands. The soldiers will be given additional training behind the French trenches and then sent into battle within a few weeks. That they will give a good account of themselves is a foregone conclusion.

A DETACHMENT of troops under General Pershing was sent to Paris, from the seaport where they had landed, to participate in a Fourth of July celebration in the French capital city. Press dispatches state that Paris turned out a crowd "that no American city ever surpassed for size, enthusiasm and profusion of Stars and Stripes." The fact is, all of France has gone wild over the arrival and the forthcoming participation of the American troops and no honors are too great to be showered upon men and officers alike. Newspaper accounts of the Fourth of July celebration give these interesting details: "The enthusiasm of the vast crowd reached its highest pitch when General Pershing, escorted by President Poincare, Marshal Joffre and other high French dignitaries, passed along, reviewing the lines of the Americans drawn up in square formations. Cheering broke out anew when the American band struck up the 'Marseillaise' and again when the French band played the 'Star Spangled Banner' and Pershing received the flags from the president. 'Vive les Americans! Vive Pershing! Vive les Etats Unis!' shouted over and over by the crowd, greeted the American standard bearers as they advanced." General Pershing has been given royal honors since his arrival a few weeks ago, enough to turn the head of a less democratic man than he has proved himself to be.

DELIVERING a Fourth of July address with characteristic pugnacity, Col. Theodore Roosevelt declared that those in America who champion Germany's cause against the cause of America are guilty of moral treason and are, in fact, although not in law, moral traitors. Speaking along this line the former president said: "For over two years Germany has heaped insult upon insult, injury upon injury, on our people. We did not even dare to prepare so as to be able effectively to resent wrong in the future. Our supine inaction was partly due to the folly engendered in our people by the professional pacifists. But an even more important factor was the dread many of our politicians felt, not merely of the German army abroad, but of German votes at home. The selfishness and shortsightedness of the American politicians were indefensible, and they were due to the fact that the men who took the lead in the German-American movement sought entirely to subordinate the actions of the country of which they were nominally citizens, the United States, to the needs of the country for which they cared, Germany. Now we are at war with Germany, yet many of these persons supported, of course, by professional pacifists, continue to champion Germany's cause as against the cause for which we are fighting. This is a moral treason to the republic, and all who engage in it are, in fact, although not in law, traitors who have no right longer to be treated as American citizens." Colonel Roosevelt has been a big factor in spurring American patriotism into action in the present crisis. He would undoubtedly like to take a hand himself in the actual fighting in France.

WITH the arrest of Joseph Graber, of Scranton, Pa., an organizer of the Industrial Workers of the World, charged with being a spy in the employ of the German government, federal authorities declared their investigation had satisfied them that recent strikes and agitations of the I. W. W. in the anthracite coal regions had been stirred up by German agents with the hope of lessening the power of the United States in the war by decreasing coal production. "Information in our hands," said John M. McCourt, assistant United States district attorney, who has had charge of the investigation, "proves the connection between the organizers and leaders of the Industrial Workers of the World movement here and the German government. Graber, an organizer of the I. W. W., is a German agent. Our information proves, too, that German money has been poured into this district in an effort to cause strikes and thus lessen coal production."

TWENTY-THREE states out of the forty-eight are bone dry now, as a result of the Reed law going into effect the first of July. This law prohibits shipment of liquor into any dry territory where its manufacture or sale is prohibited. Eleven other states are partially affected by the legislation, which has been hailed by temperance advocates as the greatest single step toward abolition of the liquor traffic in the nation's history. The law bars from prohibition areas, whether states or smaller corporations, all mail matter containing advertisements or solicitations for orders for intoxicants, a provision designed to aid in enforcing the antishipment feature by suppressing the activities of mail order houses in dry territory. Justice and postoffice department officials have made extensive preparations for enforcement of the statute. Prohibition has made wonderful strides in this country in the last few years; more within the last few months than in any similar period of time before in our national history.

THE Interstate Commerce Commission has denied the plea of the railroads of the United States for a horizontal increase of 15 per cent in freight rates. In its decision the commission indicated its willingness to increase class rates in the eastern district approximately 14 per cent. Since about one-fourth of the freight handled is moved under class rates, the decision virtually allows the eastern lines about 4 per cent increase in gross freight revenue. Increases sought in rates on coal, coke and iron ore will be granted. The commission found, as a result of extended hearings, that the carriers generally show a substantial and increasing financial prosperity and that they have ample resources with which to conduct transportation. Little sympathy was given the arguments of the roads that they were victims of war prices, the commission holding that the carriers have profited by the mobilization of troops.

THE Russian army is again in the field, attacking the German and Austrian troops in Galicia, and has been wonderfully successful in the early stages of its resumed hostilities. Gen. Hugh Scott, chief of staff of the United States army, was a witness to the successful operations of the Russian army last week. In these early attacks 10,000 German and Austrian prisoners were taken. The Russian troops were lead by Minister of War Kerensky, the man of the hour in Russia. The Russian forces are sweeping everything before them along a twenty-mile front and seem to be in a fair way to be a big factor in the allies' operations once more, notwithstanding the unsettled affairs which have come about as a result of the recent revolution and overthrow of the czar.

REGULATIONS to govern the drawing of the new national, or conscript, army were issued last week by President Wilson. The regulations make it clear that there are to be no class exemptions and that each individual case must be decided upon its merits. The local exemption boards—one for each county of less than 45,000 population or city of 30,000, with additional boards where necessary for each additional 30,000 population, will pass upon claims for exemption, except those based upon industrial or agricultural occupation, subject to appeal to the district boards. All cases involving agricultural or industrial exemptions will be passed upon by the district boards, one for each federal judicial district, which also will decide appeals from decisions of the local board. The actual date for the drawing has not been made public, but it will be some time this month, as the president hopes to have the men started in their various camps by the first of September, if possible.

OVER a score of lives were lost as a result of serious race rioting in East St. Louis last week. The outbreak was occasioned by the importation of a large number of negro laborers a few weeks ago. Early last week the negroes precipitated the trouble by firing on a wagon load of officers, killing one of them. Thereafter, it was not long until mobs were formed and a virtual state of anarchy existed in East St. Louis for several days. Negroes were shot down without warning or for the commission of any offense and negro property was destroyed. Hundreds of colored people fled across the river, to St. Louis for safety. Order was not restored until the United States government interfered and regular army troops were sent to the scene of trouble. Officials estimate the dead and dying at 100, but they admit that their figures are based merely on reports from different districts. Workers have started to searching for burned bodies in the sixteen and one-half burned blocks, mostly negro tenements. The number of dead probably never will be known, as many bodies were thrown in streams and many others burned. Three hundred and ten dwellings, mostly negro shacks, valued at $300,000, were destroyed by fire in the rioting, according to a statement made by Fire Chief M. J. Tobin.

And this was called oil!

A chemist's report on a sample taken from a crank-case

An operator of motor trucks in Rochester, N.Y., who was getting irritating results from his lubrication, furnished us with a sample of the used oil from the crank-case.

It proved to be 72% gasoline.

How did the gasoline get there?

As you know, there is a clearance between piston rings and pistons. The oil used on this car, being of wrong body and character, had failed to seal this clearance. Gasoline had been forced down past the piston rings with each compression stroke. The gasoline had then been churned into the oil until there was actually more gasoline than oil in the crank-case.

72% gasoline in crank-case oil is of course unusual.

But the incident brings out pointedly a very common condition.

Oil that furnishes a poor piston-ring seal always allows the escape of gasoline into the crank-case.

And it takes very little gasoline in the crank-case to seriously impair the oil's lubricating efficiency.

Motorists repeatedly report that Gargoyle Mobiloils, used as specified in our Chart, cut their usual gasoline consumption from 10 to 20%. Why?

Because when the proper grade of Gargoyle Mobiloil is used, the combustion chambers are sealed gas-tight and power-tight. Oil of correct body keeps the gas in the combustion chambers where it belongs. It keeps the gas out of the crank-case where it *does not* belong.

Write for new 56-page booklet containing complete discussion of your lubrication problems, list of troubles with remedies and complete Charts of Recommendations for Automobiles, Motorcycles, Tractors and Marine Engines.

In buying Gargoyle Mobiloils from your dealer, it is safest to purchase in original packages. Look for the red Gargoyle on the container. If the dealer has not the grade specified for your car, kindly write our nearest branch, giving dealer's name and address.

GARGOYLE

Mobiloils

A grade for each type of motor

CORRECT AUTOMOBILE LUBRICATION

Explanation:—The four grades of Gargoyle Mobiloils, for engine lubrication, purified to remove free carbon, are:

Gargoyle Mobiloil "A"
Gargoyle Mobiloil "B"
Gargoyle Mobiloil "E"
Gargoyle Mobiloil "Arctic"

In the Chart below, the letter opposite the car indicates the grade of Gargoyle Mobiloils that should be used. For example, "A" means Gargoyle Mobiloil "A," "Arc" means Gargoyle Mobiloil "Arctic," etc. The recommendations cover all models of both pleasure and commercial vehicles unless otherwise noted.

YOUR TRACTOR

also may be lubricated efficiently with Gargoyle Mobiloils. On request we will mail you a separate Chart specifying the correct grade for each make and model of tractor.

VACUUM OIL COMPANY, Rochester, N. Y., U. S. A.

Specialists in the manufacture of high-grade lubricants for every class of machinery. Obtainable everywhere in the world.

Domestic Branches: Detroit, Boston, New York, Chicago, Philadelphia, Kansas City, Kan., Minneapolis, Des Moines, Pittsburgh, Indianapolis

Rural Carriers at Sturgeon Bay.

Wisconsin's Loyal Band of Carriers Pledge Renewed Allegiance to the Government and Talk for Better Service.

THE men who deliver the goods in Wisconsin" were the guests of Sturgeon Bay and Door county on July 4th and 5th. It was the fourteenth annual convention of the Wisconsin Rural Letter Carriers' Association. Sturgeon Bay had invited the carriers to Door county and the citizens, together with the local carriers' association, saw to it that the visitors were entertained in a manner which they will always remember.

The entire afternoon of the 4th was given over to entertaining the visitors. An auto trip through the thousands of acres of cherry trees which have made Door county famous was the first thing on the program. The Coöperative Orchard Company, which owns over 600 acres of cherry trees in one piece, has probably the largest sour cherry orchard in the world. For two hours all the visitors could see on either side of the road were acres and acres of cherry trees all bearing heavily. Besides the large orchard of the Coöperative Company, many individual orchards of twenty acres and more were passed. Following the auto trip a special boat ride was arranged which took the visitors for a three-hour trip on the bay out to the canal which connects the bay with Lake Michigan and back to the other side of Door county into Green Bay and back. Delightful weather and music aboard the ship made the trip all the more pleasing. In the evening the convention was tendered a banquet by the commercial club of the city. After an excellent menu, a short program of music and speeches rounded out the day perfectly.

During the business session held on July 5th W. D. Brown, editor of the R. F. D. News, was the principal speaker. Mr. Brown's many years of service in behalf of the carriers at Washington, D. C., have been appreciated by the Wisconsin men and he has been on the program at the annual gathering of the association for eight successive years. There is always something vital in the talk he gives and his points are based upon close observation and a full knowledge of the problems of the country carrier. That is why Mr. Brown can speak to the convention straight from the shoulder and praise and criticise without losing his popularity. He praised the faithful service of the carriers in the past and urged the men to continue giving efficient service, especially under the trying circumstances that confront many carriers at the present time. The postoffice department, it appears, in trying to cut down the expenses of rural delivery, has eliminated many of the carriers and has added to the mileage of other carriers so that the standard route of twenty-four miles per carrier has quite fequently been increased to thirty miles. For this extra work the carriers have not been paid, though the department is very careful in grading the pay for each route downward when it is below twenty-four miles. The standard route of twenty-four miles carries with it a salary of $1,200. For each mile under twenty-four $2 or $3 a month less is paid so that an eighteen-mile route will carry with it only the salary of $912. Mr. Brown urged the carriers to be loyal to the service, but at the same time to remember that through the association they had a right to petition congress within reasonable limits for such improvements of conditions as are justified by the prevailing high prices and greater service rendered. The pay of the carriers is not commensurate with the work done. According to Mr. Brown, rough laborers in Washington receive today for work which previously brought them no more than $2.50 per day, from $6 to $7 with the same amount of work, the same kind of work and the same hours. In order to work more effectively and in order to lend more strength to the petitions it is necessary that every carrier of Wisconsin and the carriers of the other forty-seven states by members of the National Carriers' Association. Of the 1,600 carriers in Wisconsin only 622 belong to the association. Too many are afraid that their activities in the association will bring them a reprimand from headquarters. There are in the United States nearly 50,000 carriers. If these men were all members of the association and if $1 a year were charged for dues from each member the association would be in a position to make its petitions count and the funds would be sufficient to maintain a man in Washington in the interest of the rural letter carriers the year around. The city carriers are now doing this and are employing a man to present their arguments to the proper officials. The city carriers have also safeguarded themselves by having at their head a man not in the service, but with experience and a full knowledge of the needs of the city carrier. Mr. Brown urged the Wisconsin association to express itself favorably towards a similar plan in the form of a resolution and to present this at the national meeting which will be held in Kansas City during the coming month. He also urged a Civil Service Court of Appeals to which men dismissed from the service without reason could appeal for reinstatement. At present there is no opportunity for the individual carrier to plead his case even if he has the best of arguments.

The resolutions committee incorporated many of the ideas Mr. Brown had touched upon in his address in the final resolutions which were passed by the association and which will be presented to the national association. The resolutions ask that congress be petitioned for extra compensation for increased mileage at the rate of $2 per month for each additional mile over twenty-four. In view of the extra cost of equipment and the increased price of feed the carriers asked to have provided in addition to their salary $120 as a minimum for each route and a maximum of $300 for the longest routes. This money is to be applied to the purchase of horses and vehicles. The resolutions also ask for a Civil Service Court of Appeals for rural carriers. They also asked that the national convention consider a change in the constitution and by-laws of the national association so that a man not in the service can be elected an officer in the association. The meeting pledged its loyalty to the government during this crisis particularly and pledged themselves to continued faithful and efficient service in the future. W. G. Arle, president of the Door County Carriers' Association, and the citizens of Sturgeon Bay were remembered in a separate resolution which expressed the thanks of the convention for the splendid entertainment provided by the commercial club and the citizens of Sturgeon Bay. A special resolution was passed expressing the sympathy of the Wisconsin association at the death of Chas. Richter, of Saukville, Ozaukee county, who died of a paralytic stroke on the morning of the second day of the convention.

A. D. Larson, president of the association, called the attention of the carriers to the better roads program which was voted by the last legislature. Under the federal road law $1,500,000 will be available for road work in Wisconsin during the next five years, which amount the state has voted to meet with a similar appropriation and which will be expended upon the roads of Wisconsin according to the program outlined in the bill known as 444-S. This bill, since enacted into law, will combine the larger sized towns of the state by a permanent system of roads. Mr. Larson called attention to the difficulty which the carrier has to meet with upon his trips in the form of bad roads. High-priced feed and the high cost of foodstuffs have made the salary of the carrier seem out of proportion with prevailing wage rates for other work. However, the service must not suffer and he is confident that if not before, then after peace has been established the department will recognize the justice of increasing the wages of its employes.

Delegates for the national convention elected were A. D. Larson, of Sheridan; S. D. Clark, of West De-Pere; W. G. Kildow, of Whitewater; George Hiller, of Janesville; T. T. Pyburn, of Marshall, and W. G. Arle, of Sturgeon Bay.

The city of Wausau was selected for the next state convention, which is to be held on the same dates as this year, July 4th and 5th.

The officers for the coming year will be the same as last year, every officer being reëlected by unanimous vote: President, A. D. Larson, of Sheridan; vice president, T. T. Pyburn, of Marshall; secretary, E. L. Demarest, of Waupaca; treasurer, G. C. Granger, of Sheboygan Falls, and organizer, Henry Gallenbeck, of Beaver Dam.

GROUP PICTURE TAKEN AT THE FOURTEENTH ANNUAL CONVENTION OF WISCONSIN RURAL LETTER CARRIERS AT STURGEON BAY, JULY 4TH.

Monroe County Jersey Breeders' Picnic.

To the Editor:—The Monroe County Jersey Breeders' Association held its picnic June 27th at the Hill Crest Jersey Farm. The attendance was good and everybody had a fine time. The association is developing rapidly and the prospects for the Jersey in Monroe county were never so bright as now. After dinner a business meeting was held and the following officers were elected: E. E. Wyatt, president; M. L. Hill, secretary; Earl Aney, treasurer. The association has contributed a bull calf to the Red Cross, which is to be sold at auction this fall at the eastern Monroe county fair. After the meeting, I. D. Imrie, the county agent, gave an interesting talk on the Jersey cow and the value of the silo to the farmer. M. L. Hill.

Tell what you have for sale in a little advertisement in THE FARMERS' MARKET. Does not cost much and may be worth a lot to you. Six cents a word per insertion. See page 16.

Cow-Testing Reports.

In Waukesha County.

To the Editor:—There were fifty-eight forty-pound butter fat records made in the Waukesha County Guernsey Cow-Testing Association in May. A herd of twelve cows belonging to Walter Hardiman, Pewaukee, produced an average of 707.3 pounds of milk and 38.23 pounds of butter fat. The forty-five-pound list for May follows:

Owner	Breed of cow	Age	Lbs. B. fat
Wm. Steele	G. J.	7	83.41
Sam Hooper	G. G.	8	69.77
Wm. Steele	G. G.	7	64.35

Thos. H. Evans	G. G.	8	45.21

State Cow-Testing Report.

A summary of May reports of Wisconsin cow-testing associations shows some splendid records. A seven-year-old pure-bred Holstein, owned by Fletcher Bros., of Rosendale, Fond du Lac county, produced in thirty-one days, 2,985 pounds of milk containing 110 pounds butter fat. Other honors were taken by the Monticello Cow-Testing Association, of Green county, the report of which was published in a recent issue of The Wisconsin Farmer.

Testers are aiding the dairymen in various ways. H. L. Brewster, of Scandinavia, has convinced all of his members that it pays to buy milk scales and weigh the milk of each cow daily. Fred Pfuehler, of Wolf River, says twenty-four out of his thirty-two members are now weighing the milk of each cow daily. C. F. Wehrwein, of Columbus, says that he is not only testing cows but has aided all but two of his members to test their seed corn this spring.

Waukesha county Guernsey breeders are also realizing the value of cow-testing associations, and started a second association July 1st, which, like the first association, includes only Guernsey cattle.

The following associations have been recently organized: Dodgeville, Gay's Mills and La Farge, Alma Center, Brookfield, Avalon and Waukesha Guernsey No. 2.

On this page will be found a summary of the May reports received by Noel Negley, of the Wisconsin Dairymen's Association.

Sauk Prairie Association.

To the Editor:—The grade Holstein, Ellen, owned by J. A. Hatz, was high cow in the Sauk Prairie Testing Association for May with a production of 1,782 pounds milk netting 71.3 pounds butter fat. The forty-five-pound cows for May are as follows:

Owner and breed	Lbs. milk	Lbs. B. fat
J. A. Hatz, G. H.	1781	71.3
J. A. Hatz, G. H.	1519	64.3
L. A. Young, N.	1038	58.1
M. Morley, G. H.	1800	57.6
A. E. Gruber, R. H.	1372	53.3
C. Watkins, G. S.	1032	46.9
J. P. Gruber, G. H.	1658	49.7
W. Welch, G. J.	1000	46.3

Earl Klingman, Official Tester.

In Wood County.

To the Editor:—Wood County Cow-Testing Association No. 1 had sixty-five cows producing forty pounds of butter fat or more during the month of June. Practically no one is feeding, owing to the prohibitive prices of grain and other feeds, and to the exceptional quality and abundance of grass. The forty-five-pound list for June follows:

Owner, name and breed	Age	When fresh	Pounds milk	Percent of fat	Pounds B. fat
W. J. Moody & Son Belle, G. H.	5	5-18-17	1095	4.2	46.0

(Concluded on page 14.)

The Bottom Is the Heart of the Plow

It is the hard working and essential part of any plow. All the rest of the plow is built merely to enable the bottom to do its work. That is why the bottom should be designed and constructed exactly right. Upon it depends the value of the entire plow.

The right kind of plow bottom makes money for you—it lays the foundation for the right kind of seed bed. The crop yield is increased. The plow lasts longer—a saving in actual cost. It pulls lighter—a saving in horseflesh, power and trouble.

John Deere Moldboard Tractor Plows

Have the Famous John Deere Bottoms

The bottom on every John Deere plow is correctly designed—John Deere plow success is largely due to bottom construction. It is the result of eighty years experience.

John Deere tractor plows can be used *with any standard tractor*. The hitch has a wide range of adjustment.

They make one-man tractor plowing outfits. A pull of the rope by the man on the tractor lowers or raises the bottoms high and level, and the tractor does the work. Does not gather trash when turning or being transported.

John Deere Light Tractor Plows *can be backed up*—they have a stiff hitch.

John Deere Quick Detachable Shares the greatest time and labor savers ever devised for a plow, *save eight to thirty minutes changing each share*, and the change is easily accomplished. No danger of skinning your knuckles or bruising your arms.

John Deere tractor plows can be furnished with John Deere combination rolling coulters and jointers, the greatest improvement in plows since John Deere Quick Detachable Shares were developed. These jointers result in better pulverizing of the soil, turn and cover all weeds, and make plowing easier.

Two, three or four bottoms.

Write for free booklet.

Thoroughly Disc Before and After Plowing

After the grain has been cut from your fields and before the hot August and September sun has cracked the ground, allowing the subsoil moisture to escape, use the

John Deere Model B Disc Harrow

Noted for Thorough Disking

It produces a fine dirt surface mulch that *stops evaporation* of moisture and *catches and holds rainfall*. Mixes stubble, trash and weeds thoroughly into the soil. *Checks weed growth. Pulverizes surface thoroughly—ground is kept mellow—plowing is made easier.*

Using the Model B after plowing completes a seed bed that is *thoroughly pulverized through* and *through*—no trash bunches—no clods—no air spaces—*seed bed fits the subsoil perfectly.*

The Model B is *exceptionally flexible*—that is why it disks so thoroughly. The spring pressure third lever assures uniform penetration regardless of dead furrows or ridges.

Write now for free booklet on this profitable disc harrow.

Better Farm Implements and How to Use Them

America must produce more food. Labor-saving implements will play an important part in increased crop production.

This book tells all about a full line of labor-saving farming implements. Tells how to adjust and operate many of them. A practical farm implement encyclopedia. Worth dollars. Illustrates and describes the following machines: Walking and Riding Plows, Tractor Plows, Disc Plows, Disc Harrows, Spring Tooth and Spike Tooth Harrows, Corn and Cotton Planters and Drills, Listers, Alfalfa and Beet Tools, Grain Drills and Seeders, Riding and Walking Cultivators, Lister Cultivators, Mowers, Side Rakes, Loaders, Sweep Rakes and Stackers, Hay Presses, Grain and Corn Binders, Corn Cutters, Stalk Cutters, Kaffir Headers, Manure Spreaders, Portable and Inside Cup Elevators, Corn Shellers, Wagons, Farm Trucks and Buggies. This big book will be sent *FREE* if you state the implements in which you are interested and ask for Package X 640.

The Name "John Deere"

is implement insurance. It fixes the quality, and has done so for eighty years.

Don't forget that goods that have the reputation and are the biggest sellers on the market are the best in their line — always.

The increasing number of John Deere implements in use every year indicates the farmers' final verdict.

The Dairy Sire.

The dairy sire must be looked to for herd improvement. Whether the dairy be composed of grade or pure-bred cows the practical way of securing improvement is by the use of sires of a higher class than is represented in the females. Of course, many low-producing cows are being weeded out, yet it is not to be expected that the total benefit secured from this source will be but a small proportion of the great increase we may expect from the use of pure-bred sires whose ability to bring herd improvement is pronounced.

Among the advantages of a pure-bred sire is the fact he comes from a breed that has been bred for dairy production and which has been kept pure for generations. This purity of breeding is an indication that the bull will transmit the qualities of his ancestry to his offspring. The bull that is not pure bred will have in his make-up the qualities of cattle not suitable for the dairy. The qualities may be distinctly opposed to herd improvement. He would in all probability transmit to his offspring many of those undesirable characteristics. He would be very likely to lower the milk-producing average of the herd. Putting the comparison of the pure-bred and the grade bull upon the most simple basis possible we find that the pure-bred bull is very likely to be possessed of dairy characteristics which he may transmit to his offspring, while the grade is not likely to be possessed of those dairy characteristics except in a very limited degree and for that reason we can expect but very little of the transmission of dairy characteristics to the offspring. This would eliminate the grade or scrub bull even though there were no other reasons available.

Chief in favor of the pure-bred bull is the fact that successful breeders have learned, through hard experience, to use no other kind. In using the pure-bred bull he is securing the blood that has been built up through generations of successful breeding for production. To his mind the bull is half the herd and offers reasonable opportunity for improvement. The owner of a pure-bred herd seeks to improve by using a bull whose ancestral record is better than the record of his own cows. Thus in the sale of dairy bulls we find the calves of high-producing cows and the progeny of bulls whose heifers have made high records are very much in demand. The owner of a grade herd has a more certain opportunity for improvement because the average production of the ordinary grade herd is less than the production of the ordinary herd of pure breds.

Care needs to be used in selecting a dairy bull. It might be well said that to use a grade or scrub is a step backward and we may also say that only a portion of pure-bred bulls are capable of bringing improvement. This latter statement has been proven in numerous tests. Bulls whose ancestral records have indicated that they were well suited to be selected as herd breeders have failed to bring improvement when the record of their daughters was compared with the records of the dams. The bull from a cow that has made a good record and from a family known for high-production ability is to be preferred to one of unknown record.

The tried sire is the only one that may be depended upon to surely improve the herd. By tried sire is meant the one which has been in service for such length of time that his daughters are able to show by annual record that they are better dairy cows than their dams. Such sires are rare under our practice of using a bull for two or three years and then discarding him. We must pay more attention to this matter. We must watch the bulls in our neighbors' herds and seek the ones that have proven their real value as sires of desirable offspring. The great breeders and improvers of live stock have used tried sires and in order to try out males that looked hopeful they have leased them out with the understanding that they might be called in at any time they have proven their worth. In this way they found it possible to determine which of many bulls were really suited for herd improvement. Invariably they discarded many. This was done at a very low expense to themselves and it enabled them to get a line on the good ones as no other plan could possibly have done. This plan is worthy of consideration by ambitious breeders everywhere.

Coöperative owning of bulls enables farmers and dairymen to have a much better bull available than would otherwise be possible. Bull rings where a number of farmers combine to buy three or more bulls, each of which is to be used in a separate community and exchanged after two years, has much to commend them. They not only enable all farmers to patronize a promising bull but they enable the inferior bulls to be weeded out and the others are kept long enough to determine their real value which enables them to be patronized to a greater extent than would otherwise be probable.

Separators Economical and Labor Saving.

To the Editor:—For the farmer who has a few cows, the most satisfactory method of skimming milk is by the use of a good hand or power separator. While the initial cost may be thought rather high, it will soon pay for itself, because there will be practically no butter fat left in the skim milk; a better and higher testing quality of cream, and, consequently, of butter obtained; the cost of various utensils and the labor of washing is saved; and, as the separating is done at once after milking, the skim milk is always fresh and sweet for feeding calves and pigs. It is generally considered by all experienced separator users that a separator means an increase of revenue from each cow of $5 to $15 a year, according to her milk flow. The dairyman with only five or six cows would thus soon have his separator paid for.

As regards capacity, one of 450 pounds an hour is sufficient for up to about ten cows. But always bear in mind when making the selection that you want one with a capacity slightly greater than is really required, because by closing the feed trap a little and running the separator a little below its capacity it does somewhat closer skimming and thus produces richer cream. The speed should be uniform, and, if anything, a little faster

BUY THIS TRIAL LOT ON MY GUARANTEE YOU TAKE NO CHANCES

TRIAL OFFER If your dealer cannot supply you, send me his name and $1.25, and I will deliver, prepaid to your address a half-gallon can of COW EASE and SPRAYER for applying. For west of Missouri River and for Canada, above Trial Offer, $1.50.

I'M not taking any chances—neither are you. Cow-Ease does the work. I originated it sixteen years ago, and I *know*. That's why I can afford to personally guarantee your money back if Cow-Ease doesn't do for you just what it has done for thousands of farmers and dairymen.

COW-EASE
Keeps Flies off Cattle and Horses

And keeps every promise I make for it.
It increases the milk yield by keeping cattle contented, and makes milking easier because cows sprayed with it stand quiet.
Cow-Ease is a harmless liquid. It does not gum the hair or blister the skin. Apply it before each milking. One gallon sprays a cow 200 times.
Flies not only irritate your cattle and cause them to produce *less* milk and *poor* milk, but are a menace to your own health.
Ask your dealer for Cow-Ease today—the flies will "shoo" the minute you begin to use it.

M. Elton Rose Vice President.
CARPENTER-MORTON CO. 87 Sudbury St., Boston, Mass.
Manufacturers of Cow-Ease Established 1891

The President Says:

"It is of the most imperative importance that everything possible be done and done immediately to make sure of large harvests."

Conserve and Increase Your Forage Crops

Turn under part of your pasture and plant it to saleable crops. Feed your stock cheaper, easier, more profitably with a few acres of corn cut into ensilage with a Kalamazoo Ensilage Cutter and stored in a Kalamazoo silo. Stop wasting land that should be used for money crops. This year, if ever, farmers have a chance to make *big profits*.

Kalamazoo LIFE-TIME-SILOS

are built to meet the exacting farmer's needs. Best in design, material and workmanship. Have every desirable feature a silo should have and embody the "know how" acquired through more than twenty years experience in silo building.

Glazed Tile Silos—fire-proof, frost-proof, storm-proof, decay-proof, vermin-proof. Galvanized reinforcing. Require no paint, no upkeep expense or repairs. First cost is the last cost—a written guarantee goes with every one.

Wood Stave Silos—Your choice of four of the best time-defying woods. Kalamazoo Silos are manufactured complete ready to set up. Quickly and easily erected by inexperienced home labor. All Kalamazoo Silos are made with Galvanized Steel Door Frames and continuous doors, forming a safe ladder entire height of silo.

"FIRST COST ONLY COST"

It does the work!

DICK'S Blizzard Ensilage Cutter

New double feed model
Send for Catalog

The Blizzard will fill *your silo*, no matter how high, with the engine you have. It cuts evenly. Runs steady as a clock, season after season. IT DOES THE WORK.

The Blizzard is simple, compact, and does maximum work with minimum power. Knives and fans both mounted on heavy-rib-reinforced fly wheel. Every ounce of power counts. Your regular farm engine big enough. World's highest silos have been filled with Blizzards. Cuts silage evenly, no matter how fast it's run. Repair expense small. Practically no wear-out to it.

Write us how high your silo is, what power you have, how many acres you cut, and we'll be glad to advise fully which of the 6 Blizzard sizes is best for you. *Write for catalog*, describing the new double feed Blizzard. Biggest ensilage cutter improvement in years. "What Users Say" and "Making Silage Pay Better" are also most valuable and offered you free of charge.

THE JOS. DICK MFG. CO. Box 212 Canton, Ohio

SIDEHILL

The new models are "wonders." *All steel frame*; low feed table; positive safety device; *automatic feeding*; 6-arm blower that simply *can't* clog and can be regulated to height of silo; malleable knife heads; best knife adjustment. Holds record for simplicity, safety, clean cutting and great capacity. *Write for catalog* showing ten sizes. Gives full details and explains *how* and *why* the "Gehl Silbermahn" is *better*. Write today.

GEHL BROS. MFG. CO.
103 South Water St., West Bend, Wisconsin

than stated in the instructions, rather than slower. In some tests made, an extra speed of five revolutions a minute has caused an increase in the butter fat of almost as many per cent. The cream should test from 25 to 35 per cent, because the higher the quality of cream the better the butter.

Immediately after separation the cream can should be set in cold water and the cream stirred until its temperature is about 50 degrees.

The use of preservatives should be strongly discouraged, as not only are they destructive to the cream but they are absolutely unnecessary where proper conditions of dairying are carried out. After the cream is all separated, the bowl of the separator should be washed at once, the slime that has collected either burned or cast into the compost heap, and all parts washed, scalded and dried in the sunlight and air. Thorough cleaning must be carried out in every detail every time the separator is used, otherwise the cream will acquire a bad flavor and the first thing you know your returns from cream will not be as pleasing as they should be, and about the next thing you know you will be so discouraged that you will quit the business. Subscriber.

Indications of a Good Dairy Cow.

To the Editor:—The regular use of the scales and the Babcock test is an indispensable part of the work of the modern, progressive, successful dairyman. Still there are many occasions when it is desirable or necessary to form some estimate of the qualities of a cow where the information given by the scales and Babcock test is lacking. There are certain characteristics of form which more or less certainly indicate the capacity of a dairy cow. Many become so skilled in recognizing these characteristics that they are able to separate good from poor cows to a high degree. A knowledge of these characteristics is indispensable to a skillful dairyman.

It is generally recognized that a dairy cow should be wedge-shaped, that is, the skeleton of the hinder portion of the body should be distinctly more largely developed than those of the forward portions. She ought to stand from half an inch to an inch and a half higher at the hips than at the shoulders. The width as viewed from the front should be distinctly wider behind than before and the depth of the body as viewed from the side should be distinctly greater behind than before.

To be able to produce large quantities of milk a cow must also have vigorous powers of respiration and circulation. Since milk is formed by the blood vigorous circulation is required to carry the blood in large quantities to the udder and particularly to the minute capillaries. Vigorous powers of respiration are necessary to purify the large amount of blood which must pass through the lungs. Vigor of respiration is indicated by a large, deep, full chest and by large, clean, open-air passages, particularly the nostrils and throat. Vigor of circulation is indicated by prominent exterior blood vessels and by a bright pink complexion of the thinner portions of the skin and visible mucous membranes.

To secrete large amounts of milk a cow must digest and assimilate large quantities of food. She must, therefore, have large powers of digestion, assimilation and secretion. Capacity to digest is indicated to a certain extent by the size of the digestive organs, since a large part of the cow's food is bulky and she must have capacity to take in large amounts of food. Vigor of assimilation and secretion is seen in the abundance and healthy condition of the hair and the softness and pliability of the skin and the abundance of secretion from it.

More useful than any other outward characteristics of the cow as indicating her capacity to secrete is the size and condition of her udder. Naturally a useful cow must have a large udder and from the aesthetic point of view the more regular in form it is the better. The actual size and capacity of the udder, however, may not be indicated by its apparent size. In some animals the udder is held so close to the walls of the abdomen and so great a part of it is hidden between the legs that it may appear smaller than an udder of the same or even smaller size that is more pendulous.

So, too, in ascertaining the quality of an udder its so-called fleshiness must be taken into consideration, that is, in some udders the connective and fatty tissue is so much more abundant that it occupies room that would otherwise be occupied by true milk-secreting follicles. Such an udder will be tense and firm, especially when empty, and will have little secreting capacity in comparison with its size. A so-called fleshy udder is approximately the same size when empty as when full. An udder in which the greater part of the tissue is made up of milk ducts and secreting follicles will shrink rapidly as the milk is drawn from it and when empty will be particularly loose, pliable and flexible.

In the cow, as in the bull, there are many so-called "milk signs" that are relied upon more or less implicitly by various people in ascertaining the qualities of cows. Foremost among these are the milk veins. These milk veins never by any possibility contain milk, but form a system of exterior veins on the lower part of the abdomen that serve to convey a part of the blood from the udder back toward the heart.

The milk veins vary in size, in length, in sinuousness and in simplicity or multiplicity of branches. Insomuch as their size indicates to a certain extent the amount of blood circulating in them they may be considered as useful signs. The larger the milk veins naturally the larger the amount of blood flowing through them. A cow with a large, elastic, tortuous and branching milk vein is likely to be a better cow than one less well developed in this respect. The milk veins cannot, however, be relied upon implicitly as indicating the capacity of a cow to produce large quantities of milk. Subscriber.

La Crosse County Jersey Breeders.

To the Editor:—The La Crosse County Jersey Breeders' Club held its annual summer meeting Saturday, June 23d, at Progressive Hall, Holmen. Officers for the ensuing year were elected as follows: Jos. Greene, Bangor, president; Thomas Davis, Holmen, vice president; G. C. Gabel, La Crosse County School, Onalaska, secretary-treasurer. Board of directors: Theo. Skogen, Holmen; Adolph Johnson, Midway; Milo Sullivan, Mindoro; Walter Ofstedahl, Holmen.

A Minnesota Champion Guernsey.

Starlight's Contrast 33439, a six-year-old cow, owned in Minnesota, has just completed a year's record of 811.11 pounds of butter fat and 17,702 pounds of milk. This record was made with her fourth calf and with only three-fourths of an udder, one of her teats having been lost through an injury. As a junior two year old this cow made a record of 461.6 pounds of butter fat. She is now the Minnesota champion Guernsey cow of all ages.

She was sired by Starlight's Excelsior 7992. This bull has sired three high-producing daughters, all of which were state champion Guernsey producers when their records were made. It is interesting to note that these three daughters of Starlight's Excelsior have all been winners in the show ring. It is also of interest in this connection to note that a son of one of these daughters had been twelve times a champion at the age of two years, while a son of one of the other daughters was beaten in 1915 only by a three-fourths brother. This is an example of the breeding value of a proved sire. He is not only able to transmit his dairy qualities to his progeny, but his sons and daughters have also been able to transmit superior qualities to their progeny.

The highest monthly production of butter fat by Starlight's Contrast while making her last record was 86.16 pounds of butter fat, and the lowest 44.71 at the close of her record period.

Fill Any Silo at Lowest Cost

INTERNATIONAL Ensilage Cutters are now made in five sizes, with capacities ranging from 3-6 to 16-25 tons per hour. The line now includes sizes for filling every silo, from the smallest to the largest and highest.

International Ensilage Cutters fill silos at the lowest power cost. Every feature of these cutters, the knives and blowers on the same flywheel, the carefully machined bearings, the complete oiling system, the absence of all unnecessary gears and sprockets, the steady feed arrangements, the fine adjustments that can be made, all tend to make them easy running, and economical of power. A 4 to 6-H. P. Mogul kerosene engine will run a type F cutter up to its full capacity of 6 tons per hour, and the largest International cutter, a type A, requires only 25 Mogul kerosene H. P. to handle its heaviest loads.

When you buy an International Ensilage Cutter, of any size or type, you get a complete machine that will do the work it was built for at the lowest cost, with safety to the operator, and in a satisfactory manner. Our catalogues tell all about the many good features of these machines. A line to the address below will bring you full information promptly.

This Silo Filler Makes Alfalfa Chop

Write NOW For Wonderful New Smalley Book FREE

Learn how thousands of farmers are fattening hogs, cattle, sheep and poultry with alfalfa chop made quicker, easier, better than ever before! Learn how they're selling their A1 hay, milling off-grades for feed—how they're making simply great combination feeds from clover, rice, straw, bean straw, pea vines, oats, rye and corn stalks—600 to 900 pounds per hour with Junior Mill and 6 to 8 horsepower engine. This mill cracks peas, corn or velvet beans.

Smalley Silo Filler (Seven Sizes)

Chain Drive — Force-Feed Grip Hooks

Grip hooks do the work of human hands. They catch the corn—automatically push it under the paddle roller and powerful, swift revolving, bevel edge knives set like a lawn mower do the rest. No grinding, no pounding. Turns out ensilage, clean-cut, fine, uniform, unbeatable in richness. Increases tonnage! Saves time, money! Two men's labor with large outfit!

Chain Drive forever does away with belt wear, belt slipping. That means power saved! Blower operates independently of knives. Let your fan spin fast or slow—speed of cutter shaft is unchanged—more power saved! A saving of 1-5 to 1-4 in power alone. Think of it! Two machines in one!

Get all the facts. You want an outfit—need one. Write NOW for sample of chop and FREE book, to

Use A Wood Tire Hollow Wall Silo

Cannot Sag, Blow Down or Rot.

Cures and preserves silage perfectly. Prevents freezing of silage. Easy to construct. A real farm building, permanent and rigid. No hoops to get loose. No guy wires. No staves to shrink or swell, but a smooth, double wall from base to roof, the inner wall being of *California Redwood*.

Guaranteed for 20 Years

"But Lasts a Lifetime"

The patented wood "tire" is built up of inch boards, and shipped in sections. The boards overlap in step formation at both ends. When nailed together, these sections form a ring of unusual strength. The silo frame forms its own scaffolding.

WOOD TIRE

THE INDIANA SILO

Fifty thousand are now in use on the finest farms in America.

If you are going to buy a silo—this satisfactory service rendered everywhere—should be of special interest to you.

The cost of all materials is advancing like the price of wheat and corn.

Why not save money by contracting for your silo now. It undoubtedly will cost you more next spring or summer.

Let us send you our proposition—to contract now for your silo and deliver it later.

We still have openings for a limited number of farmer agents.

THE HOME

Letters intended for publication should be accompanied by the name and address of the writer, not necessarily for publication, but as a matter of good faith. All communications intended for this department should be addressed to Editor Home Dept., Wisconsin Farmer, Madison, Wis.

Knitting Needles Should Be Busy.

Many women are finding time even these days to do something in the way of knitting socks, making comfort kits and various other articles, to add to the comfort of the soldiers in the trenches. We cannot do too much, for the need is great. If our fighting men are to be supplied with these much-needed articles we must each take an active part. In England even the men and boys—those who for various reasons cannot go to the front—are knitting, thereby doing their country a service as truly as though they shouldered a gun.

We must not forget to include the sailors in our efforts to be of service, for they are in as great need as the soldiers. They need sweaters, scarfs and wristlets. To aid those who wish to do this kind of work the women of the Navy League, at Washington, have formed a committee for the supervision of making knitted articles. In any community where a group of women can unite in this work much can be accomplished, and those who wish to form such an independent unit should write to the Comforts Committee, Navy League, 1316 Sixteenth St., Washington, D. C., stating how many members there will be in the unit and how many articles or sets of articles can be furnished in three months. There are no dues connected with such a unit and no obligations whatever except to do the work. Those who are so situated that they cannot join a unit need not be discouraged, for the Comforts Committee are glad, indeed, to get single articles or sets from individuals, but where possible it is more satisfactory to work through a local unit.

Following are directions for making the sweater, muffler and wristlets. The sweater is made in one piece and sewed up at the sides:

Sweater: Cast on eighty stitches.
Knit two, purl two stitches for four inches.
Knit plain until sweater measures twenty-three inches.
Knit twenty-eight stitches, bind off twenty-four stitches for neck.
Knit twenty-eight stitches.
Knit seven ribs on each shoulder, cast on twenty-four stitches.
Knit plain for nineteen inches.
Purl two, knit two stitches for four inches.
Sew up sides, leaving nine inches for armholes.
No. 5 celluloid needle and three-fourths pound gray knitting yarn are required.
Muffler: Cast on fifty stitches.
Plain knitting for fifty-eight inches.
No. 5 celluloid needle and one-half pounds dark blue yarn are required.
Wristlets: Cast on fifty-two stitches.
Knit two, purl two for twelve inches.
Sew up, leaving two-inch space for thumb three inches from top.
No. 3 bone needle and one hank gray knitting yard are required.

Clothe the Baby For Comfort In Hot Weather.

Very much of the comfort of a child depends upon his having the right kind of clothing. This is especially true in summer. One hot day a mother came into an infant-welfare station in a large city bringing a screaming baby who would not be pacified. The trained and sympathetic eye of the nurse in charge saw that the little feet were covered with knitted woolen socks. She asked the mother to take them off. Immediately the screams ceased and the baby stretched his naked feet in delight at being relieved of the intolerable irritation.

During the hot months children should wear just as little clothing as possible. Babies require only a diaper and one other garment, while runabout babies and children up to five will be amply clothed in waist and drawers, with one outer garment, preferably a cotton slip, apron or rompers, or one of the many similar garments illustated in the pattern books.

The one-piece dress is a great boon to busy mothers, being easy to make and to wash and iron. If the kimono sleeve is used, the dress will be cooler, but in some garments the set-in sleeve is less clumsy and wears better. Rompers, loose at the knee and low-necked and short-sleeved, may be used for little girls and boys alike. Denim overalls are rather cumbersome for the hotter weather, but are adapted to cool days.

Starched, frilled and fussy garments are all alike unsuitable for young children, whose clothing should be such as will make them perfectly comfortable and permit the freest play. No child should have to think of his garments during the play hours; he should, of course, be subject to reasonable restrictions upon wilful or mischievous soiling or destruction of his clothing.

Cotton is the best material for outside garments, since a child of this age should have no clothes that cannot be washed. Mothers disagree as to the comparative merits of white clothing and colored. White garments may be boiled, and thus the amount of rubbing necessary to get them clean is very greatly lessened. On the other hand, white dresses are soiled almost as soon as the child begins to play out of doors. It must be remembered that while white or light colors show the soil sooner, there may be just as much actual dirt on the darker ones. It must also be remembered that light colors like blue, green, lavender or pink are almost certain to fade unless they are washed with special care. Striped and check ginghams fade less than plain materials, but often shrink badly in washing. Such materials should be shrunk before being made up. Seersucker and cotton crepe materials of many kinds have the great advantage of needing no ironing. These rough materials are not very cool and if used for summer wear should have short sleeves and round neck to avoid chafing the skin of the arms and neck. Percale, galatea, madras and the better grades of gingham or dress linen are all good materials for children's clothes. For hot weather almost any of the thin materials may be used.—[Children's Bureau.

Soap Economy.

Buy soap intelligently.
Make your own soap.
Utilize bits of soap.
Make your own cleaning and bleaching agents.

These are suggestions sent out by the committee on utilization and economy of one of the state councils of defense.

Within the last few weeks the price of laundry soap by the box has practically doubled and indications are that it will continue to climb. Usually there is not a marked saving in buying soap by the box when considered from the financial standpoint only. There is economy, however, in buying it in quantities and allowing it to dry. This makes it go much farther.

A good grade of laundry soap can be made in the home from drippings, rancid oils and fats that ordinarily are wasted. Homemade laundry soap may be made by using seven pounds of solid fat and one pound of lye dissolved in eleven cups of water.

Clarify and strain the fat and allow it to harden. The fat is warmed enough to melt it and the lye solution stirred in until the mixture becomes a creamy mass. It is then poured into molds to harden. This makes a firm soap for general kitchen use at a small cost.

All small pieces of soap should be saved and kept free from dirt and dust. When a sufficient number has accumulated, it can be made into soap jelly or solution. This can be used for dishwashing, woodwork, soaking clothes, washing flannels—if made from neutral soap—and scrubbing.

One bar of soap or its equivalent in small pieces may be added to two or three quarts of water in the preparation of soap solution. Shave the soap and put into a saucepan with cold water. Heat gradually for one hour until the soap is dissolved. A tablespoonful of ammonia, turpentine or kerosene may be added if desired.

One bar of soap or the equivalent in small pieces and one quart of water is recommended in the preparation of soap jelly.

A good liquid cleaning and bleaching agent can be made in the home easily by the use of one pound of sal soda dissolved in one quart of boiling water and one-fourth pound chloride of lime added to one quart of cold water. Mix thoroughly. Let stand for several hours. Pour off the clear liquid. Bottle and keep in cool place.

Home Canning By the One-Period, Cold-Pack Method.

Canning fruits and vegetables in the home by the one-period, cold-pack method is a relatively simple process and can be done with ordinary kitchen equipment and with comparatively little labor. Much of the surplus of the home garden can be saved for winter use by this canning method, which is fully described in a special bulletin just issued by the United States Department of Agriculture, Farmers' Bulletin 839, "Home Canning by the One-Period, Cold-Pack Method." This bulletin is of special interest and value to all housewives, canning clubs, societies or persons interested in conserving the food supply of the nation. It may be had on application to the United States Department of Agriculture.

The bulletin contains very explicit directions for canning practically all of the common garden vegetables, including tomatoes, peppers, sweet peppers, pumpkin, squash, sweet corn, field corn, beans, peas and root vegetables, also various combinations of vegetables. It also includes canning directions for soft fruits and berries, hard fruits, as apples, pears, quinces. Directions for the canning of camp rations, meats and soups are given in detail.

Each step in the canning process by the one-period, cold-pack method is carefully outlined from the preparation of the equipment and the raw materials to the storing of the canned products. A special time table showing how long fruits, vegetables, soups and meats should be scalded, blanched or sterilized, is of particular value to the housewife. Various types of home-made and commercial canning outfits are described.

Uses Tincture of Iron in Rose Beads.

To the Editor:—One reader of the Home page asked how to make beads from rose petals, so I will tell a way which I know of that I think would be very good. Gather the petals from roses while in bloom and grind them through the sausage grinder, using the finest knife you have. Put a little tincture of iron in the mass (which leaves the smell and makes the beads get hard), then roll as large as you wish for beads. Before drying make a small hole in each with a hatpin or darning needle.

When the beads are dry string them with small gold or silver beads, putting on the string first a gold or silver bead, then a rose one.

Do any of the readers know the words to the song "The Dying Nun?" I would be very much pleased to have them. Geneva Quackenbush.

Recipes For Hot-Weather Drinks.

Orange Nectar.—One and one-half cupfuls orange juice, one cupful pineapple juice, one-half cupful lemon juice, two-thirds cupful sugar, two cupfuls water. To the strained fruit juices add the sugar and water. Stir until sugar is dissolved, then place on ice until chilled.

Mint Punch.—One quart fresh mint leaves, one cupful grape juice, one cupful strawberry or raspberry juice, sirup. Bruise the mint leaves and cover with boiling water for ten minutes, strain and add the grape juice and strawberry or raspberry juice (either fresh or canned fruits may be used). Sweeten to taste with sirup made of equal quantities of sugar and water boiled together for ten minutes.

Egg Lemonade.—Juice of two lemons, one-fourth cupful sugar, one egg, two cupfuls water. Beat the egg until well blended. Add lemon juice and sugar and stir until dissolved. Add water, mix well, chill in refrigerator or add ice, and serve.

Black Raspberry Nectar.—Two and one-half cupfuls unsweetened raspberry juice, juice of two lemons, two-thirds cupful sugar, two cupfuls water. Wash and dry the lemons, then rub the surface thoroughly with the sugar to extract the oil. Squeeze out the juice and add to raspberry juice. Add sugar and strain. Add water and chill.

THE YOUNG FOLKS

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

A New Kind of Alarm Clock.

Dear Young Folks:—I am a little girl ten years old. My height is four feet ten inches and my weight seventy-seven pounds. I live on a farm of 104 acres. I am in the seventh grade. We named our school Pleasant Hill School and it is two miles from our house.

I will tell you about my pets. My dog can dance for anything he wants to eat, and he sits in a corner on his hind feet and does other things. I also have a pet calf and a canary bird that sings at four o'clock in the morning. We call him the alarm clock. We have three cats.

I can play most any tune on the mouth organ. Estella.

Feed Little Pigeons by Hand.

Dear Young Folks:—I am a boy about twelve years old. I live on a farm of eighty acres. I helped cultivate corn this spring.

I had some pigeons, but somebody killed them. I will tell Lucille what and how to feed and water her pigeons. I fed mine wheat, corn and a little sand to keep them in order. I fed them by hand when they were small. Open their mouths and drop the sand and grain in a little at a time. Water them with a teaspoon. You have to put the food and water in their mouths a little at a time, as they will choke if they are given too much at a time. Keep this up until they can eat by themselves.

I am in the seventh grade at school. Fred.

Wants to Know How to Float.

Dear Young Folks:—I am a boy fourteen years old. I own two young pigeons and I feed them oats and bread and give them water.

I have a boat, too. I can swim, but I don't know how to float. Can any of the boys tell me how to float without being in the water to show me?

We have a little calf that I think a great deal of. It is brown. I have made a little garden this year. I am in the seventh grade in school. Freddie.

Young Folks Scrapbook.

Dear Young Folks:—This is the first time I have written to your page. I am a girl eleven years of age. I live on a 130-acre farm. We have two automobiles and I have many rides. I have two brothers and four sisters. One of my sisters and I go to school. My older sister graduated from high school in June.

I am going to make a scrapbook and every time the paper comes I will take the Young Folks' stories and paste them in it. I am going to call it the Young Folks' scrapbook. Alice.

What to Feed Young Pigeons.

Dear Young Folks:—I have never written a letter before, but I enjoy reading your letters. I am a girl thirteen years old. I have two sisters and one brother. I am in the seventh grade at school.

Lucille wanted to know what to feed her young pigeons. I am going to tell her what I feed mine. I feed them mostly chop and maize. I have twelve old pigeons and four young ones. Willie.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Inclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date 1917 spring and summer catalog, containing over 550 designs of ladies', misses', and children's patterns, also some points for the needle. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

2154—A pretty summer dress with sleeve in either of two lengths. Pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 6 yards of 44-inch material for a 38-inch size.

2133—A smart and popular style. The skirt is a five-gore model. The pattern is cut in 4 sizes: 8, 10, 12 and 14 years. Size 10 will require 4¼ yards of 44-inch material.

2161—A charming and seasonable combination. Pattern is cut in 5 sizes: 2, 4, 6, 8 and 10 years. Size 4 will require 2⅜ yards for the dress, ⅝ yard for the hat and ⅜ yard for the basket, of 36-inch material.

Waist 2155-Skirt 2147—For business, home or shopping.—Waist pattern 2155 is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 3 yards of 36 inch material for a medium size. The skirt 2147 is cut in 6 sizes: 22, 24, 26, 28, 30 and 32 inches waist measure. Size 24 requires 4¾ yards of 36-inch material. Two separate patterns, 10 cents for each pattern.

9074—Infant's set, consisting of a dress, a slip, a kimono, barra-coat, nightgown and petticoat. The set is cut in one size. The dress will require 2½ yards of 36-inch material. The slip 2¼ yards, and the petticoat, nightgown and kimono will each require 2 yards. The barra-coat will require one yard of flannel for the skirt, and ½ yard of cambric or muslin for the body.

2141—A comfortable apron model. Pattern is cut in 4 sizes: Small, 32 and 34; medium, 36 and 38; large, 40 and 42, and extra large, 44 and 46 inches bust measure. It requires 5⅛ yards of 36-inch material for a medium size.

9716—Girls' underwaist and drawers. Pattern is cut in 5 sizes: 4, 6, 8, 10 and 12 years. It requires ¾ yard of 36-inch material for the waist and 1 yard for the drawers for a 6-year size.

2004—Junior dress, with sleeve in either of two lengths. Pattern is cut in 3 sizes; 12, 14 and 16 years. It requires 5¼ yards of 36-inch material for a 14 year size.

1751—A charming summer frock. Pattern is cut in 4 sizes: 14, 16, 18 and 20 years. It requires 4 yards of 44-inch material for the dress with ruffles, and 3 yards without ruffles for a 14-year size.

1979—Ladies' shirt waist. Pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 2¾ yards of 36-inch material for a 36-inch size.

1720—A smart, but simple dress. Pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Size 36 will require 6 yards of 44-inch material for a 36-inch size.

2150—A simple negligee. Pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 4 yards of 36-inch material for a 36-inch size.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for July 15, 1917.

Hezekiah, the Faithful King.

LESSON TEXT—II Chron. 30:1.

GOLDEN TEXT—He that cometh to God must believe that he is, and that he is a rewarder of them that diligently seek him.—Heb. 11:6.

The reformation under Hezekiah is one of the bright and attractive spots in the latter history of the kingdom of Israel. It was a most thorough reformation and God set his seal upon it in many wonderful ways. Teachers ought to give their classes a comprehensive view of all that Hezekiah did, as recorded in II Chron., chapters 29-32.

I. Hezekiah's Proclamation. (vv. 1-6). The proper introduction to this lesson would be to return to chapter twenty-nine and note the restoration of the worship of Jehovah. How it began in one man's heart, Hezekiah; how he called the people to be clean (29:15), then called upon a cleansing of the house of God and its restoration (vv. 18, 19). How he called them to renewed sacrifice and worship (vv. 20, 21). The restoration of the sin-offering and of the burnt-offering, and the result of these offerings in the Levitical music and in the worship of the great congregation (29, 28). The sequel of song always follows and accompanies a true revival of religion. Having consecrated themselves unto the Lord, Hezekiah sends out this proclamation. The consecration of the people, as referred to in chapter 29, was very complete. (See vv. 31-36.) Hezekiah was a man of deep discernment as well as of true piety. He saw the meaning of the sacrifice of redemption and put the passover forward as the very heart-center of the worship of Jehovah. (See vv. 1, 2.) Whoever understands the passover, understands God's way of salvation. (See Exodus 12:13-23; I Cor. 5:7, 8; Rom. 3:25, 26; John 1:29.) Hezekiah did not confine his call to those of Israel alone, but extended it beyond its borders to those of Ephraim, thus manifesting the true missionary spirit. Hezekiah had ample Scriptural warrant keeping this passover out of its regular order (vv. 9-13). God is not a God of time or place. Wherever obedience is possible, whether it be a matter of time or not, God approves. Hezekiah, however, did not act upon his own initiative, but sought counsel. (See v. 2.) The man who is the most clearly led of God is the man who is most eager and anxious to know how God is leading other men and will listen most patiently to their counsel. The fact that the people had not "gathered themselves together at Jerusalem" for a long time, might have warranted a further delay. Not so with this enthusiastic young king. He was not bound by precedent, but was anxious to please God.

II. Hezekiah's Exhortation (vv. 7-13). Hezekiah began his exhortation by calling attention to the trespasses of their fathers (v. 7). At the same time he reminds them that if God gave them over to desolation because they themselves were stiff-necked (v. 8) and yielded not themselves unto the Lord to enter his sanctuary, which he had sanctified unto them, they would come under the fierceness of God's wrath, for they had turned from the Lord; they had "trespassed against the Lord God of their fathers." Because of that trespass God had "given them up to desolation." Literally he had made them "an astonishment." This astonishment and desolation was well known, "as ye see" (v. 7). Anyone with eyes open can see today the desolation of individuals, of families, communities and nations who trespass against God. For a generation we have had the deity of Christ and the inspiration of his Word called into question and that the individual man is the dictator of his own conscience and life, and it is because men have departed from their faithful allegiance to Jesus Christ and fail to obey his command, that we see the strife and desolation of today.

The first departure caused people to be "stiff-necked" and Jehovah is calling them to repentance, but they would not hear (see Ch. 36:13; Ex. 32:9; Rom. 10:21). In place of this "stiff-neckness" of their hearts Hezekiah entreats them to turn again to the Lord and not to be stiff-necked as were their fathers (v. 8).-that if they will turn again unto the Lord (v. 9) they will find compassion so that they shall again enter his gracious and merciful dealings. Having yielded themselves they were to enter into communion with him and "enter into his sanctuary, which he had sanctified forever."

They were also to serve him. Most blessed results were to follow for them and for their brethren and their children, but all of this bright prospect is conditioned upon repentance, surrender, communion and service, which is based upon the fact that Jehovah "is gracious and merciful" (Ex. 34:6, 7; Ps. 86:5; Jonah 4:2; Mark 7:18). Then, even as now, there were those who would not yield themselves to God's gracious invitation. As the priests passed through the country of Ephraim and Manasseh, even unto Zebulun, they were "laughed to scorn and some mocked" (v. 10).

The Weight of War

The heavy hand of war has disturbed the balance between supply and demand the world over. Our problem of serving the public has all at once assumed a new and weightier aspect.

Extraordinary demands on telephone service by the Government have been made and are being met. Equipment must be provided for the great training camps, the coast-defense stations must be linked together by means of communication, and the facilities perfected to put the Government in touch with the entire country at a moment's notice.

In planning for additions to the plant of the Bell System for 1917, one hundred and thirty millions of dollars were apportioned. This is by far the largest program ever undertaken.

But the cost of raw materials has doubled in a year. Adequate supplies of copper, lead, wire, steel and other essentials of new equipment are becoming harder to get at any price, for the demands of war must be met.

Under the pressure of business incident to the war, the telephone-using public must co-operate in order that our new plans to meet the extraordinary growth in telephone stations and traffic may be made adequate.

The elimination of unnecessary telephone calls is a patriotic duty just as is the elimination of all waste at such a time. Your Government must have a "clear talk track."

J. L. Williams, Official Tester.

New Holstein Association.

To the Editor:—In May 382 cows were under test in the New Holstein Cow-Testing Association, Calumet county. Sixty of these produced forty pounds of butter fat and fourteen more than fifty pounds. The best cow in the association is a grade Guernsey owned by H. J. Duecker. She produced 1,593.4 pounds of milk and 68.5 pounds of butter fat. A Guernsey herd of eighteen cows owned by F. F. Thielke & Son produced an average of 873 pounds of milk and 41.8 pounds of butter fat. The forty-five-pound list for May follows:

Name, owner and breed	Age	When fresh	Pounds milk	Percent of fat	Pounds B. fat

Black Earth Association.

To the Editor:—The Black Earth Cow-Testing Association, Dane county, organized in March, began testing April 19th. It has twenty-nine members and there are 627 cows under test for the year. During the month ending May 19th 514 cows were under test and twenty-two of them produced over forty pounds of butter fat. Fred Stubley's herd of Jerseys produced an average of 36.2 pounds of butter fat per cow. Mr. Stubley also had the banner cow which produced 57.7 pounds. About sixty of our cows are pure breds and the balance grades. Eight unprofitable cows have been sold to date. The forty-five-pound list for the first month follows:

Owner, name and breed	Age	When fresh	Pounds milk	Percent of fat	Pounds B. fat
John Coldwell					
Whity, N.	4	4-17	975	5.2	50.7
Bert Stuart					
Spot No. 1. G. H.	10	3-17	1163	4.0	46.5
Fred Stubley					
Bessie, R. J....			884	5.6	49.5
Princess, R. J...			983	5.5	54.1
Kilda Girl, R. J.			930	6.2	57.7
Mint Drop, R. J.			1181	4.2	49.6
Robt. Brunner					
Tillie, G .D. ...	5	5-1-17	1308	3.5	45.8

John Uebersetzig, Official Tester.
H. C. Sukliffe, Secretary.

Rules and Boards for the Draft.

The Way the Selective Draft Will Be Made and the Men Who Will Handle it in Wisconsin.

IN THE near future, probably about July 15th, the work of choosing those who will make up the first armed troops which the United States will send to Europe, out of about 10,000,000 who registered on June 5th, will be begun. It is expected that probably a million and a half will be chosen by lot at this time.

The rules of the selective draft, as announced last week by President Wilson, do not provide for the exemption of any particular class of citizens, such as farmers or mechanics, but leaves the question of exemption to be decided in each individual case on its own merits by the exemption boards.

There are two kinds of exemption boards—a local one for each county or city and one for each federal district. The local exemption boards comprise three men in each county having less than 45,000 population and in each city of less than 30,000 population, with additional boards for each additional 30,000 population. The federal district exemption board comprises five members from each federal district in each state.

The first step in the selective draft process will be the meeting of all county and city exemption boards, who will number consecutively all those who registered in their jurisdictions on June 5th, and the names and numbers will be posted publicly and given to the press. Following this the local exemption boards will be notified of the quota apportioned to them, but the number of voluntary enlistments in either the national guard or in the regular army or navy from each county or city shall be deducted from the quota assigned to it for draft.

Numbers will then be drawn by lot sufficient to make up the county or city's quota and then men whose numbers correspond with those drawn will be notified within three days, their names will be publicly posted and given to the press. The men so designated will appear before the local exemption board and will first be given a careful physical examination, subject to revision later by regular army surgeons. If the physical examination is passed, then comes the question of exemptions for other causes.

Local exemption boards have power to exempt only state or federal public officials, persons in the military or naval service, ministers of religion and students of divinity, alien enemies, those on whom others (such as wife, child, widow, aged or infirm parents, orphan child under sixteen, etc.) are largely dependent, the morally defective and members of any recognized religious sect prior to May 18, 1917, whose creed forbids participation in war and whose religious convictions accord with that creed. Claims for exemption because of dependents may be made by the man himself, by those dependent on him or by a third party, who has personally investigated the case, and they must be accompanied by at least two corroborating affidavits and complete proof that the dependents are actually supported mainly by the man's physical or mental work. County and city exemption boards are required to pass upon such claims within three days after the affidavits are filed and, in case the parties are not satisfied, they can then appeal to the exemption board of five men for their federal district, who must give a decision within five days after the closing of the proofs. Their decision is final.

All claims for exemption on the ground of necessary agricultural or industrial occupations can be presented only to the federal district exemption board of five men, as the local county or city boards have no authority to consider them. The federal district exemption boards must be convinced before granting exemptions for this reason, that the services of the man claiming exemption on these grounds are actually necessary to the maintenance of the military forces or to the national interest of the United States.

Certificates of exemption are not necessarily permanent and may be revoked with changing conditions or they may be granted for a limited time only, such as until after the harvesting of crops.

The following are the county exemption boards for Wisconsin:

Adams—J. W. Hoard, A. J. Soley, G. F. Treadwell and John W. Purdy, all of Friendship; A. W. Baker, of Hancock; John Huber, of Brooks, and C. F. Heberlein, of Kilbourn.

Ashland—C. L. Kleinsteiber, T. R. Yankee, J. M. Dodd, C. A. Lamereaux, J. A. Watson and C. O. Hertzman, of Ashland; W. G. Fordyce, of Butternut.

Barron—H. P. Borgen, T. T. Hazelberg, Nels Werner and T. W. Borrum, of Barron; J. W. Bell, of Chetek; W. A. Demers, of Rice Lake, and H. S. Comstock, of Cumberland.

Bayfield—Andy Murray and Nels M. Oscar and D. P. G. Frey and J. W. McLoed, of Washburn; J. P. Savage, of Iron River; C. H. Werden, of Mason, and J. W. Dady, of Bayfield.

Brown—Dr. D. H. Gregory and H. J. Smith, of De Pere; Henry C. Smith, of Green Bay, and H. J. Flaherty, of Denmark.

Buffalo—Albert Anderson, John Mell and E. J. Ganz, of Alma; Dr. P. B. Amundson and Dr. John Luetscher, of Mondovi; F. J. Bohri, Jr., of Fountain City, and Otto Ochsner, of Waumandee.

Barnett—R. C. Anderson, T. C. Olson, A. P. Nelson and A. L. Kyllo, of Grantsburg; L. R. Roberts, of Webster; J. E. Spangberg, of Siren, and Richard Goldsmith, of Swiss.

Calumet—Herman Rau, E. G. Hard, Dr. E. L. Bolton and H. F. Pingel, of Chilton; Dr. F. J. Fecter and H. D. Lawson, of New Holstein; F. D. Pieper, of Hilbert.

Chippewa—J. G. Cornell, C. L. Christianson, C. A. Hayes, H. J. Goddard and W. H. Howleson, of Chippewa Falls; W. H. Bridgman, of Stanley; A. T. Newman, of Bloomer.

Clark—Henry Hewitt, O. C. Anderson, Dr. E. L. Bradbury, R. F. Kuntz, Otis Slocumb, of Neillsville; Dr W. R. McCutchen, of Thorpe; F. W. Draper, of Loyal.

Columbia—J. R. Klabunde, H. R. Tongen and H. T. Andrews, of Portage; A. V. De Nevin, Wyocena; Robert Caldwell, of Lodi; C. D. Riggs, of Leo; L. A. Wright, of Columbus.

Crawford—J. F. Herold, Sam Sletmark, C. A. Armstrong, L. F. Copsey, of Prairie du Chien; A. B. Peterson, of Soldier's Grove; G. T. Atwood, of Gays Mills; Dr. T. E. Ferell, of Seneca.

Dodge Board No. 1—Harry Marsh, Chas. Hawks and F. H. Clausen, of Horicon; Frank E. Woodward, of Watertown; R. M. Fletcher and Dr. O. E. Gaetsch, of Eustiford; Dr. Louis Bachhuber, of Mayville.

Board No. 2—C. W. Hathaway, F. F. Aldach and W. E. Hallock, of Juneau; A. B. Chandler and E. E. Williams, of Beaver Dam; M. E. Terry, of Lowell, W. J. Conklin, of Fox Lake.

Door—Eli Stegmann, R. Herlache, Dr. T. C. Proctor and N. C. Garland, of Sturgeon Bay; Sam Perry, of Forestville; Wm. Jess, of Washington Island; Rev. O. N. Jordheim, of Clay Banks.

Douglas—Dr. A. G. Wilcox and E. S. Cosgrove, of Solon Springs; K. W. McLaggan, of Cordon; A. G. Earshaw, of Lake Nebagamon and R. B. Johnson, of Superior.

Dunn—Frank Pieper, Henry Miller, F. Mortensen, Dr. I. V. Grannis and G. M. Hovlid, of Menominee; E. B. Hill, of Colfax; E. E. Black, of Downing.

Eau Claire—George Garman, J. H.

DRY FARMERS LOOK!

FINE WHEAT LAND

$10.00 to $15.00 AN ACRE
10 years to pay

Are you an experienced farmer?

Are you willing to work?

Do you understand dry land wheat?

Have you money enough to start?

THEN READ ON!

Promontory - Curlew project — greatest dry farm wheat land opportunity ever offered in the West! 400,000 acres of virgin wheat land located in northern Utah (look at map); over 200,000 acres already purchased and under cultivation by farmers from every state in the Union. Over 500,000 bushels of wheat, oats, barley and rye raised last year. Land yields up to 45 bushels of wheat per acre first year. Costs only $9.00 per acre to clear, plow, harrow, seed, cut and thresh. Good markets, close; transcontinental railroad (Southern Pacific) through the property; good schools — churches — prosperous towns, everywhere.

Soil rich, sandy, clayey loam. Last year Utah's wheat and oats per acre average yield was one of the highest in the United States. Learn more about this great wheat land offer.

Officers and directors of company include as President, former U. S. Congressman Joseph Howell of Utah—for 17 years member House of Representatives, United States Congress. Write today for free illustrated booklet. Address

PROMONTORY-CURLEW LAND COMPANY,
Logan, Utah.

La Fayette—F. A. Waddington, of Argyle; M. A. O'Brien, of Shullsburg; W. V. Valle, of Benton; E. T. Conley, Joseph Courthard, R. E. Van Matre, Dr. H. O. Shockley, of Darlington.

Langlade—H. J. Hersant, of Phlox; E. F. Buchen, V. P. Rath, Dr. J. C. Wright, J. C. Lewis, F. J. Finucane and Fred Jacobus, of Antigo.

Lincoln—H. H. Patzer, John Brandt, D. B. Reinhart, J. E. Emerich, A. C. Ebert, of Merrill; G. G. Curtis, of Erma; Andrew Oelhoffen, of Tomahawk.

Manitowoc, Board No. 1—Gustave Zill, of Cleveland; J. A. Kellner, A. J. Anton, F. S. Luhmann, E. S. Bebell, H. L. Vitz and Fred Carus, of Manitowoc.

Board No. 2—George H. Dicke Dr. J. R. Currens and Herman Ludke, of Two Rivers; William Morgan, of Cato; William Getzlo, of Kiel; D. C. Cavanaugh, of Reedsville; Milo Dushek, of Maribel.

Marathon—Board No. 1—Henry Creutzer, of Athens; Alfred Puchuer, of Edgar; Dr. A. L. Schemmer, of Colby; Carl Kronewetter, of Mosinee; A. E. Beebe, of MacMillan; George Kock, of Unity; George Damon, of Spencer.

Board No. 2—C. N. Gorling, L. H. Cook, W. A. Ladwigg, H. G. Flieth, F. P. Stone, W. L. Edmonds and A. W. Trevitt, of Wausau.

Marinette—George E. Bograud, of Wausaukee; John N. Harp, of Peshtigo; Michael Hallan, E. H. Wazek, R. R. Heim, F. C. Burke and H. A. Somerville, of Marinette.

Marquette—Dr. S. A. MacGregor and F. W. Meinke, of Westfield; Chas. Brown, Chas. W. Gay and F. J. Dodge, of Monticello; F. J. Kimball, of Briggsville; C. E. Pierce, of Princeton.

Milwaukee—Dr. H. T. Brogan, of West Allis; Dr. J. H. Rohr, of North Milwaukee; George H. Gabell, of East Milwaukee; John Kleist, of Whitefish Bay; Lyman Waller, of Wauwatosa.

Board No. 2—J. P. Buescher and B. A. Eton, of Cudahy; Ben Baden, of Hales Corner; D. T. Gerber, of Oakwood; Dr. A. L. Rumch, William Kunke and William Grobschmidt, of South Milwaukee.

Monroe—John L. Hefferman, of Wilton; E. C. Vanvree and Chas. M. Corty, of Tomah; George A. Henry, O. J. Jackson, Dr. S. J. Beebe and R. D. McCoy, of Sparta.

Oconto—Ira Telford, H. C. Orr, T. C. Clarke and E. G. Mullan, of Oconto; L. P. Perry, of Gillette; W. A. Flatley, of Oconto Falls; J. P. Brazeau, of Coleman.

Oneida—F. S. Campbell, of Three Lakes; D. L. Jenkinson, of Minocqua; Hans Rodd, J. J. Virage, Dr. T. B. McIndoe, E. O. Brown and T. C. Wood, of Rhinelander.

Outagamie—Edward Draeger, W. F. Wolf, Dr. W. M. Moore, J. G. Rosebush, R. C. Wolter, F. J. Harwood and C. J. Hagen, of Appleton.

Board No. 2—M. A. Wirthiemer, of Kaukauna; P. W. Silverwood, of Oneida; Dr. A. M. Foster, C. E. Raught, D. J. Ryan and H. J. Mulholland, of South Kaukauna; Douglas Hodgins, of Hortonville.

Ozaukee—Peter Watery, Jr., John Biehler, George F. Savage, Port Washington, Judge J. E. Uselding, Port Washington; Dr. T. J. Roesch, Cedarburg; Bernhardt Herziger, Jr., Thiensville; Dr. T. D. Ryan, Fredonia.

Pepin—W. P. Taylor, W. C. Richardson, Dr. W. W. Cassidy and N. N. McMahon, Vivus; W. Dorwin, Durand; Edward F. Woods, Pepin; C. J. Swanson, Stockholm.

Pierce—Toby Halverson, Ole J. Hohle, Dr. W. E. Lumley and E. W. Campbell, Ellsworth; F. M. White, River Falls; W. C. Condit, Rock Elm; George S. Fox, Spring Valley.

Polk—O. H. Peterson and N. O. Swanson, Balsam Lake; Dr. H. C. Caldwell, St. Croix Falls; W. T. Kennedy, Amery; C. E. Hanson, Luck; E. E. Husband, Balsam Lake; A. J. McLennan, Clear Lake.

Portage—J. F. Kubisiak, A. E. Bourn, Dr. C. Von Neupert, W. E. Fisher and W. E. Ackwell, of Stevens Point; O. A. Crowell, of Almond; L. A. Pomeroy, of Amhurst.

Price—Nick J. Bey, W. H. Lippels, Dr. C. D. Fenlon and F. E. Morner, of Phillips; J. B. Saunders, of Park Falls; E. R. Brown, of Kennan, and C. A. Lugquist, of Ogema.

Racine—F. A. Malone, Waterford; J. J. Wishau, of Racine; George Ela, of Rochester; Louis H. Rohr, of Burlington, and A. J. Topp, of Waterford.

Richland—O. J. Howard, W. A. Lawton and F. W. McKee, of Richland Center; H. A. Brace, of Lone Rock; Joe Bock, of Gotham; Peter H. Quinn, of Casenovia, and Charles Nye, of Viola.

Rock, Board No. 1—R. O. Whipple, H. W. Lee, J. F. Pomber and J. A. Craig, of Janesville; William McIntosh, of Edgerton; E. Van Patten, of Evansville; Irving Hinckley, of Milton Jct.

Board No. 2—G. B. Ingersoll, Dr. Arthur Helm, William O'Neill, James Brittan and Charles Still, of Beloit; J. W. Mohlenpaugh, of Clinton.

Rusk—William Dodson, F. E. Munroe, Dr. L. M. Lundmark and J. W. Carow, of Ladysmith; C. K. Ellingson, of Hawkins; A. F. Hein, of Tony; Peter J. Kassola, of Wyerhauser.

St. Croix—August Larson, H. S. Offerdahl, Dr. L. P. Mayer and N. C. Varnum, of Hudson; George Oakes, of New Richmond; O. K. Hawley, of Baldwin; C. J. Augustus, of Glenwood City.

Sauk—William Welk, of Baraboo; Frank A. Cooper, L. W. Sayles and Wilbur Cahoon, of Baraboo; H. E. Paddock, of Lavalle; August Siefert, of Reedsburg, and Robert Buerki, of Sauk City.

Sawyer—J. S. Johnson, John Berger, Dr. G. A. Larson, William Giblin, J. S. McGeorge, of Hayward; A. A. Veness, of Exeland; O. C. Satin, of Winter.

Shawano—C. E. Otto, O. O. Wiegand, W. H. Cantwell and M. J. Wallrich, of Shawano; Paul Fuhrman, of Bowler; H. J. Bloecher, of Whittenburg, and Guy Van Doren, of Birnamwood.

Sheboygan Board No. 1—George S. Goodell, R. H. Thomas, A. G. Zeiss, F. S. Morris, E. E. Pantzer, Francis Williams, William Braasch, of Sheboygan.

Board No. 2—Dr. E. B. Felter, E. A. Dow, Carl Corbett, Charles Eastman, H. Davis, Plymouth; George Spratt and Charles Weisse, of Sheboygan Falls.

Taylor—W. E. Hibbard, Carl Herrmann, Dr. Eugene Le Sage, R. A. Kolb and Herman Leicht, of Medford; J. W. Kaye, of Westboro; Joseph Brehm, of Rib Lake.

Trempealeau—Ed Erickson, P. K. Risberg, O. J. Eggum, C. B. Melby, of Whitehall; Dr. J. J. Powell, of Galesville; Frank A. Hotchkiss, of Independence; Ole Aylfest of Blair.

Vernon—P. A. Camden, Berlie Moore, W. M. Trowbridge, C. V. Porter, Sr., L. C. Boyle, C. W. Fowell and F. M. Minshall, of Viroqua.

Vilas—G. H. Jackson, A. Hong, Dr. A. W. Thorpe, Alex. Higgins, P. J. Gaffney, N. M. Emmons and Grant Cook, of Eagle River.

Walworth—W. E. Babcock, G. D. Harrington, Edward Kinne and Geo. L. Harrington, of Elkhorn; F. H. Kiser, of Whitewater; J. C. Reynolds, of Lake Geneva; M. E. Cusack, of Darien.

Washburn—F. P. O'Connor and F. G. Tozer, of Shell Lake; Dr. W. L. M. Knowles, Frank Hammill, C. D. Stockwell and H. J. Bielch, of Spooner; F. L. Lampson, of Lampson.

Washington—Frank Schoenbeck, R. G. Kraemer, W. J. Kehle and G. A. Kuechenmeister, of West Bend; J. F. Mayer, of Richfield; Frank Salter, of S. Germantown; F. M. Le Count, of Hartford.

Waukesha—A. L. Morris, R. M. Funk and Henry Lochnet, of Waukesha; Dr. S. B. Ackley, of Oconomowoc; Charles Solveson, of Nashota; C. W. Fraser, of Menominee Falls; R. G. Morey, of Genesee Depot.

Waupaca—Albert Arnold, L. F. Shoemaker and J. F. Jardine, of Waupaca; Dr. G. T. Dawley and W. H. Hatton, of New London; Otto Zachow, of Clintonville; J. B. Jensen, of Manawa.

Waushara—H. J. Hawkins, W. B. Stilwell, Dr. L. A. Van dor Linde and J. F. Dignan, of Wautoma; C. M. Anderson, of Wild Rose; F. B. Trickey, of Plainfield; George H. Fuller, of Spring Lake.

Winnebago—Dr. Frank M. Corry and S. F. Shattick, of Menasha; F. J. Sensenbrenner and S. A. Cook, of Neenah; H. B. Patch, of Omro.

Wood—J. E. Normington, Sam Church and T. W. Brazeau, of Grand Rapids; Dr. W. G. Sexton and W. H. Upham, of Marshfield; John Werner, of Pittsville; Orve Carlin, of Vesper.

In the counties which have two or more boards the jurisdiction of these boards has been determined upon as follows:

Dodge, Board No. 1—Towns of Ashippun, Clymen, Emmett, Herman, Hubbard, Hustisford, Lebaron, Le Roy, Lomira, Rubicon, Shields, Theresa, Williamstown, Watertown and the villages of Hustisford, Loming, Neosho, Theresa and the cities of Horicon and Mayville; population, 23,518.

Board No. 2—Towns of Beaver Dam, Calamus, Burnett, Chester, Elba Fox Lake, Oak Grove, Lowell, Portland, Trenton, Westford, and the villages of Fox Lake, Lowell, Reeseville, the east ward of the village of Randolph, the first, second, third and fourth wards of the city of Waupun, and the cities of Juneau and Beaver Dam, population 23,918.

Fond du Lac, Board No. 1.—The towns of Calumet, Empire, Fond du Lac, Forest, Friendship, Marshfield, and Taycheedah, and the villages of North Fond du Lac, St. Cloud and the city of Fond du Lac, population 29,198.

Board No. 2.—Towns of Alto, Ashford, Auburn, Byron, Eden, Eldorado, Lamartine, Metomen, Osceola, Oakfield, Ripon, Rosendale, Springdale, Waupun, and the villages of Brandon, Oakfield, Campbellsport and the fifth and sixth wards of the city of Waupun, and the city of Ripon, population 22,412.

Manitowoc, Board No. 1.—The towns of Centerville, Liberty, Manitowoc, Manitowoc Rapids, Meeme, Newton and the city of Manitowoc, population of 21,942.

Board No. 2.—Towns of Cato, Coopertown, Eaton, Franklin, Gibson, Kossuk, Maple Grove, Mishicot, Rockland, Schleswig, Two Creeks, Two Rivers, and the villages of Kiel, Reedsville, and the city of Two Rivers, population 23,206.

Marathon, Board No. 1.—Towns of Bergem, Berlin, Bern, Briton, Cassel, Cleveland, Day, Eauplaine, Emmet, Frankfurt, Flieth, Hasley, Hamburg, Holton, Hall, Johnson, Maine, MacMillan, Marathon, Mosinee, Rib Falls, Riethbrock, Spencer, Steppin, Wein and the villages of Athens, Marathon, MacMillan, Mosinee, Edgar, Spencer, Stratford, east ward of the village of Colby and that part of the village of Unity within the county of Marathon, population 26,664.

Board No. 2.—The towns of Eston, Eldron, Franzen, Harrison, Hewitt, Knowlton, Kronenwetter, Norris, Pike Lake, Clover, Ringel, Texas, Wausau, Weston and the villages of Brokaw, Schofield, and the city of Wausau, population 28,990.

Outagamie, Board No. 1.—Towns of Bobina, Center, Dale, Ellington, Grand Chute, Greenville, and the village of Shiocton, and the city of Appleton, population 24,871.

Board No. 2.—Towns of Buchanan, Black Creek, Cicero, Deer Creek, Freedom, Hortonia, Caucana, Liberty, Maple Creek, Maine, Oneida, Osborne, Seymour, Vandenbroek, and the villages of Black Creek, Kimberly, Little Chute, Hortonville, Welton and the cities of Kaucana, Seymour, and the third ward of New London, population 24,231.

Rock, Board No. 1.—The towns of Center, Fulton, Janesville, Lima, Milton, Magnolia, Porter, Union, and the cities of Edgerton, Evansville, Janesville, and the village of Milton, population, 27,749.

Board No. 2.—The towns of Avon, Beloit Bradford, Clinton, Harmony, Johnston, La Prairie, Newark, Plymouth, Rock Spring Valley, Turtle, and the villages of Clinton, Orfordville, and the city of Beloit, population 27,789.

Sheboygan, Board No. 1.—The towns of Sheboygan and the city of Sheboygan, population 28,687.

Board No. 2.—The towns of Greenbush, Herman, Holland, Lima, Lyndon, Mitchell, Mosell, Plymouth, Rhine, Russell, Scott, Sheboygan Falls, Sherman, Wilson and the villages of Cedar Grove, Elkhart Lake, Oostburg, Randon Lake, Sheboygan Falls, and the city of Plymouth, population 26,201.

Milwaukee, Board No. 1.—Town of Lake, and the city of Cudahy, 18th ward of the city of Milwaukee, the towns of Granville in Milwaukee, and the villages of North Milwaukee, Whitefish Bay and East Milwaukee, population 19,638.

Board No. 2.—The village of West Milwaukee, the cities of West Allis and South Milwaukee, and the towns of Greenfield, Franklin, Oak Creek, population 21,814.

The Auto Utilizer

Makes Your Power Problem Easy if You Own An Automobile

The Auto Utilizer converts the driving power of an auto into belt power for Grinding Feed, Sawing Wood, Filling Silo, Running Milking Machinery, Generating Light Current, Pumping Water.

JUST RUN CAR ONTO RUNWAY—NO JACKING UP, NOTHING TO ATTACH.

Car stands level and runs exactly as it does on the road. No strain on differential, for both rear wheels revolve the same all the time—just like running for miles and miles in a perfectly straight line. The easiest thing a car was ever set to do.

It turns the luxury of owning an auto into an economical investment. It makes one engine, the auto engine (which always is a better engine) the only one you need on your farm.

Find out just how the Auto Utilizer works—how easily it is moved about—how simple it makes all your farm power problems—why it makes any other engine unnecessary. Send for descriptive literature. Ask your dealer if he has seen it—if he is going to demonstrate it.

THE AUTO UTILIZER CO.

Dept. W. F. Burlington, Wis.

Army and Navy Packet For You

Count the Dots and Win a Beautiful Prize

You see in the picture, an Automobile covered with dots. Can you count the number of dots on this Auto? If you can do this, we will send you as a prize, *a packet of five beautiful Army and Navy post cards*, lithographed in rich colors and also a certificate of entry in our grand contest for a Saxon Automobile. All you have to do is to enclose a two cent stamp in your letter to pay postage and cost of mailing.

SAXON AUTO GIVEN AWAY

Remember the Saxon will absolutely be given away at the close of the grand contest. In case of a tie a Saxon will be given to each person so tied. Send at once so you can be entered in this great contest. Full particulars by return mail. THE AUTO MAN, Dept. 314, Des Moines, Iowa.

Pastures Furnish Abundant Feed.

Live Stock on Grass Look Fine—Hay Yield Will Be Uneven—Small Grains Promise Well—Corn Is Still Late.

WISCONSIN.

Adams County.—Oats are growing well. Corn is backward and clover is hard to cure on account of wet weather. Alfalfa cut and in the barn. Pasture is good and cattle look well. Dry weather would be acceptable for a few weeks. Help is scarce.—Louis Wallert.

Bayfield County.—Good growing weather prevails, except that there is too much moisture for corn on heavy soil. Oats, wheat, rye, barley and peas are doing fine. Old meadows do not look well, but the new seeding is fine. With the copious rains we have had the old meadows may thicken up. Strawberries are late. Potatoes look fairly well and the late planting is coming up. Cherries and apples will yield fairly well. Pastures are good and live stock are doing fine. Their number is about average. The acreage of beans was increased about 75 per cent this year.—E. C. Stevens.

Burnett County.—Grain never looked better than at present. Potatoes are fine. Hay will yield about 50 per cent below last year's crop. Corn grows slowly on account of the cold weather. Pastures are not good, because it is too dry and cold.—Fred Larson.

Chippewa County.—The grain crop looks well. Hay will yield lighter than last year. Corn grows slowly. Potatoes look well. Garden truck has improved much since the recent rains. Fruit is fairly good. Live stock is in good condition. Cold weather has delayed crops to some extent.—Gustave E. Rheingans.

Clark County.—All crops are fine. A few fields of corn were damaged to some extent by cutworms. Clover haying will commence as soon as the weather is favorable. The crops of apples and small fruits will be about average. Pastures are good and live stock are healthy and growing.—Fred Ackerman.

Grant County.—July commenced with a light frost, which is not encouraging to the corn raiser. Hay and other grass is good. The hay harvest has already begun. Oats and barley look fine; the straw of both is very tall. Winter wheat and rye have done better than was expected. Pastures are good. Garden truck and potatoes look well. Cherries are making a good crop and some varieties of apples are doing fine. Live stock are in good health. P. R. Stoffel.

Iron County.—The hay crop is light and late timothy has not started to head yet. Rain is plentiful, which may push the crop along, but at this time the condition is about 25 per cent below normal. Pastures look well and cattle are doing fine. About 10 per cent more calves will be raised this year. Garden truck is doing well.—H. P.

Kewaunee County.—Corn is all planted, but some that was planted early had to be replanted. Small grains look well, but are about two weeks late. Cold weather and too much rain caused the delay in vegetation. Hay is also about two weeks late, but clover will make a good crop. Quite a few farmers planted soy beans in the corn this year. Pastures are fair and live stock are doing well. Apples promise about 90 per cent of a crop. Garden truck and small fruit are doing well.—W. C. Katel.

Marinette County.—Pastures are fine. Corn is growing nicely and some has been cultivated for the third time. The new seeding is doing well. Frequent rains have done much to promote the growth of clover. Oats and wheat promise well. Sugar beets have a poor stand. Early potatoes look well; the acreage of late ones is large. Pigs are scarce, selling at from $10 to $12 a pair. Several cheese factories have started up. The milk flow is good. Some orchards show an abundance of fruit, but others failed to bloom. Small fruits look fine.—W. B. Sanderson.

Monroe County.—Hay and small grain look well. Hay will make a big crop. Some farmers have cut alfalfa, and have begun to cut clover. Corn is not as good as last year and needs warmer weather. Pastures are good and cows are doing well. Strawberries are yielding well.—S. F. Jones.

Oneida County.—Hay is short and will not be ready to cut before the middle of July. Small grains are growing well. Corn is backward because of cold weather. Potatoes are out of the ground and cultivation has commenced. Pastures are fair.—Art Blumenstein.

Outagamie County.—Good rains have kept pastures in excellent condition and assured an abundant hay crop. Wheat, oats, barley and rye look fine, although they are late. Corn has a good stand and is well tended; the outlook is very good. Potatoes promise a full crop and $4 potatoes will not be heard of again. Live stock of all kinds are in good health. Wool is selling at from 50 to 60 cents a pound. Dairying is making good progress—butter is worth 37 cents, cheese 22 cents and skim milk $1 per cwt. Calves are in good number, although there is a temptation to sell them for veal, which is bringing from $10 to $14 per 100. Pigs are scarce and high priced; the demand is much greater than the supply.—Peter Tubbs.

Pierce County.—The oat crop looks fine. Barley has a rather poor stand, but the color is good. A few days of warm weather have started the corn. There is very little wheat, but it looks well. Old meadows are thin, but the new seeding is fine. Pastures are fine since the recent heavy rains. Potatoes never looked better. The alfalfa crop is good; some plants measure forty inches long. Reports say a few hogs have died of cholera.—T. W. Eaton.

Racine County.—Wet cool weather delayed all crops. Corn is late and weedy. Small grain shows fair condition. Old seeding of hay is light, but the new seeding which survived the winter is good. Cabbage planting has begun; the time is about two weeks later than usual. The acreage will be less than usual because the plants are scarce and not very good in quality. Potatoes are good. Pastures look fair. The fruit prospect is not especially good.—Chas. Jeffery.

Winnebago County.—The season has been cold, with heavy rains, but in spite of this, small grains and pasture look well. Hay is good, except on old meadows, where the crop is thin. Potatoes have rotted in the ground to some extent. Garden crops were damaged to some extent by cold, but in general crops promise fairly well. Live stock are in good condition, but hogs are rather scarce.—Seymour L. Smith.

BUY YOUR SILO NOW

Not Safe to Delay

We can fill your order if you buy that silo now. But you must act quickly—our supply of materials is rapidly being depleted. Orders are coming in fast. Next year's prices will be much higher — so order now. Be on the safe side. Buy a Saginaw. You have the choice of either a Saginaw Steel-Built or Saginaw Leader Silo.

A prominent New York Banker says: "There ought to be a million silos built and filled before the growing season is over. They will not only help to win the war but to make living cheaper after the war."

Don't delay. Write or wire us at once. Address Dept 183.

The McClure Co.

Saginaw, Mich. Cairo, Ill.

POULTRY AND PET STOCK.

FOR SALE—S. C. RHODE ISLAND REDS

GOOD BREEDERS from exhibition and trapnested laying stock. Write for prices. **WINNEBAGO POULTRY YARDS, A. J. Schloerb, Mgr., R. 23, Omro, Wis.**

BARRED PLYMOUTH ROCKS and Buff Orpington ducks; Chicago winners; great layers; established 1892; eggs for hatching: $1.50, 15; $4.50, 50; $8, 100; prompt delivery and good hatch guaranteed. G. Earl Hoover, R. 24, Matthews, Ind.

HATCHING EGGS; prize-winning S. C. Reds, White Wyandottes, Buff Orpingtons, S. C. White and Brown Leghorns, $1.50 per 15. Ledge View Poultry Farms, Box W. F., Fond du Lac, Wis.

HATCHING EGGS—S. C. Reds, prize-winners all leading shows. Eggs, $1.50, 15; $8, 100. Order from this ad. Address C. L. Pre-Fontaine, Box 600, Fond du Lac, Wisconsin.

RHODE ISLAND REDS—Setting of 15 eggs from pure-bred prize-winning Rhode Island Reds, $2 per setting, three settings for $5. Hildebrandt & Vea, Stoughton, Wis.

Langlade Jersey Meeting.

Langlade county Jersey men enjoyed a pleasant and profitable day at Blaine Stewart's farm on Friday, June 29th. W. H. Clark, widely known Jersey breeder of Rice Lake, was guest of honor and principal speaker for the day. Frank Krall, of Elmhurst, lead home the high-grade Jersey calf offered by the association in the drawing contest.

Ladies of the Winner Grange served refreshments to the kiddies and perchance to the grownups who developed "sweet tooth." Mary O'Connor gave a recitation in her usual most pleasing manner.

The attendance might have been larger, but as it was included a majority of the Jersey men of the county.

Mr. Clark spoke on "The Importance of the Sire in Developing the Dairy Herd." He urged in no uncertain language the absolute necessity of every dairyman using only a pure-bred sire, a good individual and one not only from a good producing dam, but also from a line of good producing ancestry. Health, vigor and a good constitution he urged as essentials in the make-up of a sire. "Raise the calf well if you want good cows," was another of the choice bits of advice which he gave. "We weigh every bit of the milk which our calves get up to the time they are six months old. Our calves get all the grain they will eat of practically the same mixture that we feed the cows. We feed our calves skim milk until they are about ten months old. Feed them on whole milk for the first month and feed them three times a day."

"The man who robs his calves of the milk that they must have when they are small, so as to increase his check at the cheese factory, is holding the penny so close to his eye that he can't see the future dairy dollar at arm's length," declared Mr. Clark. "You'll never have a good cow if you don't raise the calf right. Get your heifers to freshen at two years old and keep them working. Don't be afraid to feed. The dairy cow is the best market a farmer has for hay, grain and corn raised on his farm.

County Representative Swoboda told of what the Jerseys had been doing in Langlade county. He gave records of a number of the best producing cows and herds in the cow-testing association. Figures given were of the type to convince the most strenuous knocker of the breed that Jerseys will make good even in the strenuous climate of northern Wisconsin, if given a chance.

Some of the accomplishments of Langlade county Jerseys as given are worthy of careful consideration of every thoughtful dairyman. In 1915 the high cow of the Langlade County Cow-Testing Association, Chas. Schotte's Jersey, Susie, produced 466.3 pounds of fat from 8,424 pounds of milk. This same cow held the record for 1916 with 478 pounds of fat. This record is all the more remarkable, as the cow spent a week at the Wisconsin State Fair as one of the ten high cows for the cow-testing associations of the state.

Of the ten high cows in the association, seven of them were Jerseys, including the first four positions each with a fat record of 429 pounds or better.

The high herd in 1915 was a Jersey herd, with an average fat production of 381 pounds. In 1916 the three highest cows were Jerseys. These records are all the more remarkable when the proportion of Jerseys to other breeds is known. Of the 366 cows that completed the year's work, eighty-eight were Jerseys. Of thirty cows with records of butter fat above 350 pounds, eighteen were Jerseys. Of the eight high herds, herd No. 1 had three out of seven cows Jerseys. No. 2, 3 and 4 were solid Jerseys. No. 5 was 85 per cent Jersey. No. 7 and 8 were Jersey.

Perhaps the most remarkable cow in the association was a twenty-two-year-old Jersey cow belonging to Bert Wright, which produced 352.6 pounds of fat out of 6,682 pounds of milk. Her gross returns were over $114.48 feed cost, $46.22 and profit, $68.25. A fifteen-year-old Jersey cow, owned by Harry Guenthner, produced 364.1 pounds of fat from 7,649 pounds of milk. Gross returns, $123.62; feed cost, $53.29; profit, $70.23.

Jerseys also carried off the honors for high-producing two year olds. A Jersey heifer belonging to Mrs. J. Knos produced 298 pounds of fat from 5,040 pounds of milk. Queen Lorena, a Jersey heifer belonging to Walter Head, produced 286.6 pounds of fat. That it pays to feed well was well proven in the 1916 records. Mr. Schotte's cow, Susie, with a feed bill of $58.46, produced gross returns from sale of milk of $159.41, and a net profit of $100.95. One of Harry Lyon's Jerseys produced a net profit of $93.70 after paying a feed bill of $43.43. Several other Jerseys produced net profits around $90.

Sec. Perry Gillet secured a number of new memberships for the association. There are now fifteen pure-bred Jersey sires in the county. Four of them were brought in within the past year. Most of the Jersey breeders are members of the cow-testing association.

THE FARMERS' MARKET

WANTED—FOR SALE—TO EXCHANGE

THIS department is to bring the buyer and the seller together. You may want help. You may have live stock, poultry and eggs, or machinery for sale. Maybe you want to sell or to buy a farm. Think how you can advertise now. Write your copy for the advertisement. The rate is six cents per word, each insertion. Note the low cost to reach our 90,000 circulation.

THE WISCONSIN FARMER -:- MADISON, WIS.

LIGHTNING RODS.

RELIABLE AGENTS, write for 1917 agency for Diddie-Blitzen rods. Best lightning rods sold. L. F. Diddie Co., Marshfield, Wis.

PET STOCK.

CANARIES, Parrots, Pheasants, fancy pigeons, monkeys, bears, wolves, ferrets; pets of all kinds. Circular free. Detroit Bird Store, Detroit, Mich.

FARM LANDS.

ALABAMA ALFALFA LANDS—Beautiful rolling prairie country, well drained naturally, health conditions very good, ample timber and shade, overflowing artesian wells of pure water, 50 inches annual rainfall, ideal climate, mild winters. Alfalfa grows without liming or inoculation, stays green all year, grazed December to March with cattle, sheep and hogs, cut for hay 4 to 6 times in season, variety native grasses and several clovers growing wild. Soil rich in lime makes best production of live stock. We are tick free. Dairying very profitable. Labor cheap and plenty of it. Creamery here paying Elgin prices and better for butter fat. Buy here where so many farmers and breeders from 11 different states have bought and making good; 30,000 acres for sale; any size farm wanted, terms reasonable, land cheap considering fertility and quality of soil. Good railroad facilities, several pike roads and more building. Corn, wheat, oats, velvet beans and many other crops grown here. Full information and photographs upon request. C. C. Clay Alfalfa Land Co., Demopolis, Ala.

NORTH DAKOTA in per capita and farm production surpasses every other state. As many dollars per acre can be produced as in states where land sells four times as high. Government records prove it. Climate, soil, crops, railroads, schools, roads exactly as good as best in Illinois, Iowa and Minnesota. The Soo Line wants practical diversifying farmers. You can obtain a home without commission to us while land is still cheap; easy terms. Write at once for our plan of direct dealing. J. S. Murphy, Immigration Agent, Soo Line Ry., 1272 Soo Bldg., Minneapolis, Minn.

SILENT PARTNER WANTED—We have a fine chance to buy fine farms close to the city of Oconto, Wis., suitable for stock farms, that would feed over a thousand head of cattle, at a very low price on account of old age and death of owners. There are over 100 head of thoroughbreds on them now that would go with the farm. There is big money for the party that would furnish the money to swing the deal. Address C. S. Hart, Oconto, Wisconsin.

40 ACRES FOR SALE—Some improvements; river running through; no waste land; plenty of timber to pay for it. Make good small stock or poultry farm. $1,000 if taken soon. Small capital needed. Fred Christiansen, Wittenberg, Wis.

40, 80 OR 160 ACRES good clay loam land. Hardwood timbered or open land ready to farm. No waste land. Close to towns. $20 to $25 per acre. $200 down, balance long time. F. M. Doyle, Immigration Agent, Ladysmith, Wis.

FARM FOR SALE—Within five miles of a village of fifteen hundred inhabitants. Fifteen acres cleared. $2500 worth of saw log timber. Price right, and terms reasonable. Write Healy-Brown Co., Wausau, Wis.

BURLEIGH COUNTY, N. D., improved and unimproved lands $20 to $35 per acre. Aurora County, S. D., improved farms $43 to $60 per acre, sold on very easy terms. A. H. Schroeder, Mankato, Minn.

668-ACRE IMPROVED STOCK FARM, Polk Co., Wis.; good buildings, fences, living water; small payments, easy terms, low interest. Write for description. Mason Booth, owner, Merchants' Hotel, St. Paul, Minn.

FOR SALE—80-acre farm, 3½ miles from county seat; 60 acres cultivated; fine buildings; insured for $3,900. Must be sold. Price $6,500. Address R. J. Russell, 812 King St., LaCrosse, Wisconsin.

640 ACRES FREE—Circular explains. Box 18, Havre, Montana.

BUSINESS CHANCES.

FREE for six months—My special offer to introduce my magazine, "Investing for Profit." It is worth $10 a copy to anyone who has not acquired sufficient money to provide necessities and comforts for self and loved ones. It shows how to become richer, quickly and honestly. Investing for Profits is the only progressive financial journal and has the largest circulation in America. It shows how $100 grows to $2,200; write now and I'll send it six months free. H. L. Barber, 509-28 W. Jackson Boulevard, Chicago.

HELP WANTED.

WANTED AT ONCE—Three men to work on poultry farm. Must thoroughly understand either incubation and brooding, feeding or health and sanitation. Are willing to pay good wages to the right man. Address Oak Dale Farm, Austin, Minn.

TELEGRAPHY.

TELEGRAPHY—Summer rates extended account big demand for help by government and telegraph companies. Ladies and gentlemen act quick. Wisconsin School of Telegraphy, Oshkosh, Wis.

LEARN TELEGRAPHY—Positions guaranteed. Northwestern Telegraph School, Eau Claire, Wis.

MONEY TO LOAN.

MONEY to loan on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage. 6% with privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

STOCK WANTED.

STOCK WANTED—Will take herd of cattle (young or mature) for 160-acre tract in Edmunds county, S. D. Also tracts in Indiana and Michigan for like exchange. Farmers Securities Company, South Bend, Ind.

REGISTERED HOLSTEIN BULL.

REGISTERED HOLSTEIN BULL ready for service; 2 of his dams averaged 100 lbs. milk in 1 day and 35 lbs. butter in 7 days, officially. $100. Wisconsin Live Stock Association, Appleton, Wis.

CALVES FOR SALE.

CHOICE HIGH-GRADE Holsteins, Guernseys and Short-horn calves. A few select ones at $15 to $35 each, expressed at little cost. Write Ed. Howey Co., South St. Paul, Minn.

MILKING MACHINE FOR SALE.

FOR SALE—Milking machine. Two-cow unit. Automatic vacuum and natural air pressure type. In first-class condition. Address G. H. Daugherty, 33 S. Stone Ave., LaGrange, Ill.

COWS FOR SALE.

I HAVE FOR SALE a large assortment of choice tubercular tested cows, all due to freshen soon. You can buy one or a carload. John Blanchard, Columbus, Wis.

Live Stock and Commercial Field Notes

Collected by Representatives of The Wisconsin Farmer

Schuster's Recent Purchases at Stevens Bros.' Sale, Liverpool, N. Y.

WHILE visiting Mr. Schuster's herd a few days ago we were greatly impressed with his 20 head of animals recently purchased at the Stevens Brothers' sale. Mr. Schuster now has the distinction of having twice as many 30-pound cows in his herd as any other breeder in the state of Wisconsin. He now has eight 30-pound cows, including Belle Pontiac Lincoln 156045, that has 32.82 pounds butter and 711.30 pounds milk in seven days. She averaged over 100 pounds of milk a day for one month. Another of his 30-pound cows is Lulu Inka Pietertje Pontiac 218410, with a record of 32.38 pounds butter, 589.30 pounds milk as a four year old in seven days and 31.47, 581.40 as a three year old in seven days. K. P. Gem 201634 has 31.82 and 522.10 at three and a half years in seven days. K. P. Johanna 157597 has 30.62 pounds butter and 491.70 pounds milk in seven days and a semiofficial yearly record at two and one-half years of 856.4 pounds butter and 17,973.10 pounds milk. K. P. Ruby Pietertje 164900 with 33.37 pounds of butter. Princess Korndyke Topsy Paul 2d 181952 with 30.57 pounds of butter and K. P. Daffy 176706 with 30.10 pounds butter constitute the remainder of the 30-pound cows recently purchased at Stevens Bros.' sale. Three females of this shipment are bred to King of the Pontiacs, which has more 40-pound daughters, more 30-pound daughters and more 20-pound junior two-year-old daughters than any other sire of the breed. Six other females of the shipment are bred to King Model, the young sire that sold for $10,400 and was considered good enough by the Stevens Bros. to use on a large number of their best cows and two other females with the consignment are bred to another of the noted herd sires of the Stevens Bros.' herd, known as It, a 37-pound bull. Holstein breeders looking for herd sires of extraordinary merit will do well to keep this herd in mind. Mr. Schuster is now looking for a 40-pound bull to head this great herd. His farm is located at Mukwonago, Wis.—Adv.

Mr. William M. Jones, Waukesha, Wis.

MR. JONES has just completed a most excellent test barn, containing 13 box stalls, which are now filled with cows that live up to the reputation of the Jones herd. A number of these animals are going nicely and will in all probability finish with records that will be in keeping with the excellent performance of a number of animals in the herd which have already been tested. Dora Adda, for instance, made 81 pounds of butter fat a month for the first three months of her test. She has a daughter that will finish the last day of July that will go better than 700 pounds. Lady Tricksey of Waukesha is now about seven months along on her test and is now going at the rate of two pounds of butter fat a day. Her highest month was 83 pounds of butter fat and she likewise in all probability will go over 700 pounds for a year. Yeksas' Tops of Gold's Boy was just two years old the day we visited the herd and a larger, more promising Guernsey bull we have never had the opportunity of inspecting. He is a son of the record cow, Yeksas' Tops of Gold's Fanny, the cow that has done much to make Mr. Jones' herd famous and is a great example of size, vigor and strong constitution which are characteristics that stand out prominently in Mr. Jones' herd.—Adv.

Mike Stoehr, Viroqua.

MIKE STOEHR, Viroqua, Wis., is paying more atention to the Duroc end of his business and he has a bunch of porkers this spring that he has reason to feel proud of. He has some March pigs that are as good as any we have seen. The demand is for stretch and his pigs have it together with the other good points. Most of the pigs are sired by a son of the grand champion, Prince Illustrator, and out of real good sows. Mr. Stoehr has five sows that are dandies—big, high backs, good feet and good brood sows. His sows farrowed an average of 12 pigs to the litter, and raised over eight. The sows are of The Professor breeding. This breeding has a Professor bred boar, two years old that he cannot use to advantage any longer, that he will sell. He is a big boar and is too good to sell on the market. Anyone wanting a tried sire should investigate this boar. The spring pigs are ready to ship and they will please you. Notice the advertisement in this issue and when writing please mention The Wisconsin Farmer.—Adv.

Fuel Saver For Ford Cars.

FORD owners will be interested to hear that a device has been perfected that enables them to run their cars on kerosene instead of gasoline. Most anyone will pocket the saving and be glad of it. The device is attachable to any Ford motor in a short time. The car is started on gasoline that is carried in a separate little tank and after running a minute is switched over onto the kerosene. It has been demonstrated that a car will travel farther and faster on a gallon of kerosene than on the same amount of "gas"; the engine gives a steadier pull; can be throttled down lower and will take grades that could not be made on high with gasoline. The Burn-Oil Device Company, of Peoria, Ill., is making and selling this device and they will send printed matter if you will give them your name and address. Tell them you read about it in The Wisconsin Farmer.—Adv.

Geo. W. Browne, Waukesha, Wis.

MR. BROWNE has been conspicuous at the recent Waukesha county Guernsey sales from the fact that he has been buying much of the choicest stock that has been offered at these auctions, and today he has on his Broad Ripple Stock Farm some very choice cows about 19 of which are now on official test. Imp. Lynchmeie Vespasia 3d, a very good-looking cow that has now been on test for seven and one-half months; Kate of Sunny Valley has made over 400 pounds during her first six months; Glencoe of Maple Hill is going at about two pounds of butter fat per day, and Maplene Alice on test about eight months is going at the rate of 600 pounds of butter fat. Marietta of Maple Hill, that has a record of 640 pounds of butter fat at three and a half years is now on re-test and going at about 80 pounds butter fat a month. One of the herd sires used in Mr. Browne's herd is Dora's Boy of Sunny Valley, whose dam is Royalene's Dora that has 717 pounds butter fat in a year and a full sister to her son just mentioned has 601 pounds as a two year old. Mr. Browne has two bull calves now sired by this bull for sale. Mr. C. E. Browne former manager of the Biglow Holstein Farm, Breedsville, Mich., and who has also been manager of the Kempton Farm, near Duluth, Minn., has recently been selected as general manager of this farm. Geo. Konrad, who has had much experience in test work, is now giving a good account of himself with the cows now on official test.—Adv.

Edgewood Stock Farm, Burlington, Wis.

THE Edgewood Stock Farm has been purchasing a number of very choice pure-bred animals with which to build up their herd. At the recent Waukesha County Holstein Breeders' Sale they purchased several heifers from the Baird Brothers' consignment which was recognized as being one of the best offerings at the sale and also purchased Daising Pontiac Butterman, a bull that has been a noted prize winner last year was senior and grand champion at the Wisconsin State Fair. This herd sire is one of the best individuals of the breed and should do much for improving the individuality of the Edgewood Stock Farm herd. King Pontiac Segis Veeman, a 29.29-pound son of King Segis Pontiac Count, that is now at the head of the herd which won more prize money for A. R. O. work last year than any other herd and which has the distinction of having the greatest producing junior two-year-old daughters of the breed. A more detailed description of this bull will appear in the advertisement on page 19.—Adv.

Dr. B. L. Werner Advertisement.

NOTICE the Holstein advertisement of Dr. B. L. Werner, Marshfield, Wis. The cows and price would be hard to duplicate and they are bred to an excellent young bull. If interested write at once, this opportunity won't last long.—Adv.

Smiley Polands For Sale.

WM. SMILEY & SONS, Albany, Wis., are now ready to supply you with your Poland China boars. We do not hesitate to say that the Smileys have a fine bunch of pigs this spring. The top sow of the Madison sale has seven good pigs by Crow's Progress. They are for sale. The $110 gilt has eight by a son of Black Jumbo. Other good pigs by Wisconsin Jumbo 2d, Major Miller and Smiley's King. Get busy if you want the pick at a reasonable price.—Adv.

Carpenter & Carpenter.

WHEN considering the good herds of Short-horn cattle that grace the farms of Wisconsin, one cannot overlook the herd owned by Carpenter & Carpenter, Baraboo, Wis. Their herd is made up of the very best Scotch cows, many of which are imported. The attractions on the farm just at this time are many, owing to the fact that so many choice individuals are going to make the fair circuit this fall. Lord Cullen, the imported herd sire, is in the nicest condition we have ever seen him. He weighs right at 2,600 and his smoothness is very noticeable. Maxwalton Queen, the aged cow that they showed so successfully last year, is in fine condition. She is due to calve in a very short time. She will make a wonderful showing. This firm has a two year old by Sultan Mine that is choice. She has just had a calf, which took off a little flesh, but by fair time she will be one of the good two year olds. The senior yearling is by Regal Stamp and she is one for which no apologies will have to be offered. All the young stuff is by Lord Cullen and after looking at the heifers and bulls by this sire, one cannot help but be impressed with him as a meritorious sire. On October 31st this firm will hold a calf sale in Chicago. This will consist of 65 lots, bulls and heifers, many of which are imported. Everything will be of the choicest Scotch breeding. In due time more will be said about this good herd.—Adv.

Evansville Chester White Headquarters.

EVANSVILLE, WIS., can claim Chester White headquarters; at least we feel safe in saying that no other town in the sttate can boast of three better herds of this breed. It's not a case of one good herd, but the three herds will compare with any in the state. In the three herds the very best blood lines are represented and as for individuality, we have seen no better pigs than those owned at Evansville. The Evansville breeders will hold a bred sow sale February 6th and their ambition is to place an offering of Chester White sows before the public that will be a credit to the breed in Wisconsin. When you see a Chester think of Evansville and watch next week's issue for further announcement.—Adv.

Hillside Stock Farm Belgians.

KIRKPATRICK BROS., proprietors of Hillside Stock Farm, Holstein headquarters, at Reedsburg, Wis., offer for sale some choice Holsteins. The three cows are the big kind with good A. R. O. records and they can be bought worth the money. They also offer four heifers that are choice with the very best breeding and A. R. O. backing. The bulls are light in color and from excellent dams. It will pay you to investigate this offer.

Look For the Monogram.

ON page 18 of this issue is a blank space with a monogram in the center. In next week's issue this space will contain information of interest to many of our readers. Watch for the advertisement and the monogram.—Adv.

A Long Wonder Boar For Sale.

LONG WONDER heads one of the good Duroc Jersey herds in Iowa and the McClurg Bros., Viroqua, Wis., have a son of this boar that they will sell. He is the largest spring boar we have seen this spring and some farmer that wants a Duroc boar better than any of his neighbors have, should write relative to this boar. He sure has the size and quality.—Adv.

Q For Quackenbush.

Q FOR Quackenbush, quality and quantity is to be the slogan used by W. W. Quackenbush, Melrose, Wis. Mr. Quackenbush has one of the select Poland China herds in the state. His herd is made up of representatives of the most noted families of the breed. About five years ago state fair winners were purchased for foundation stock. In 1915 the second-prize boar pig at the Iowa State Fair was purchased and he made good, for some of the best sows in the herd are sired by Matchless Wonder. The top gilt in the Madison sale was by this boar. Two sisters to this gilt are in this herd. Victoria G. 541538, one of the best sows, raised 11 pigs this spring by Chief Price. Giantess W., the top gilt in Joe Hendricks' 1916 sale raised 10 pigs by Chief Price. When this gilt was 12 months and three days old she weighed 535 pounds and farrowed a litter of 14 pigs. Mr. Quackenbush bought five sows in the Madison sale that averaged $120. They made good. The spring pigs are sired by the following noted boars: Mc's Big Bone Orange Wonder, Big Ben Jr., Blue Valley King, Sunrise Price, Big Ben H. and Chief Price. This breeder has the goods and can ship you a good boar pig worth the money. We saw this herd and was very much impressed with it. Melrose is near Black River Falls, his shipping point. Quackenbush and McDonald are only two miles apart. We are glad to recommend this herd. See page 18.—Adv.

Shanks-High Model-Investor.

THE above combination is a winner. W. N. Shanks, Worthington, Minn., has, in a few short years stepped into prominence as one of the leading breeders of high-class Durocs. Every boar used in this herd has been a sire of note but the greatest of all is Investor. Many great offerings have been made from this herd, but the one to be made August 14th will outclass all former offerings of boars. There are 45 head listed, 15 fall boars mostly by High Model, but there are a few by Grand Model 12th and by Royal Gano, both of which were also used in the herd. The 15 spring boars are all by Investor and most of them are from daughters of High Model, though several of them are from daughters of King the Col. Among the sows are several of the Lady Top Notcher family which has proved to be the most successful things used in this herd. In a later issue we shall have more to say about this good offering. Watch The Wisconsin Farmer, but in the meantime address Mr. Shanks as above for catalog or any other information which you may desire. Please mention The Wisconsin Farmer in writing.—Adv.

H. P. Pazik, Waukesha, Wis.

MR. PAZIK, who has been breeding Ayrshires but a comparatively short time, has been making remarkable progress and has shown good judgment to place at the head of his herd, Cavalier's Fond Hope a noted prize winner formerly owned by Adam Seitz. This bull has won first at three National Dairy Shows ,trhee Dairy Congresses and never lost a blue ribbon during the entire time he was on the circuits. Mr. Pazik now has a good sized herd and is expecting to increase it to 60 or 70 head. He also has a number of very good cows in his herd so that breeders looking for bull calves will do well to keep Mr. Pazik's herd in mind, as calves sired by Cavalier's Fond Hope are practically certain to be good individuals.—Adv.

L. R. Seibecker, Baraboo.

L. R. Seibecker, Baraboo, Wis., has only been breeding Duroc Jerseys for about two years and we believe he is going to make a real hog man. He has 35 spring pigs, most of them April farrow and they are better than many March pigs we have seen. Mr. Seibecker will offer his boars and gilts about the middle of July and we feel confident that anyone ordering a Duroc from him will be pleased with his purchase. His advertisement will appear in The Wisconsin Farmer.—Adv.

FORTY head of splendid Galloway cows and heifers and 10 or 12 young bulls are offered for sale by C. S Hechtner, Chariton, Iowa, on page 19. These are the very best of Galloway cattle and some of the cows are imported and some have been his very best show cows. If you are looking for some real bargains make it a point to go and see Mr. Hechtner. When you write him kindly mention this paper.—Adv.

His Wisconsin Farmer Advertisement Sold All His Hogs

MY advertising in The Wisconsin Farmer has sold all of my fall boars and have also sold some spring pigs through it. Could have sold a great many more. Got inquiries every day from the advertisement. Am well pleased with the results and will always remain with you.—J. C. Hendricks breeder of Poland China hogs, Hazel Green, Wis.

THE MARKETS.

Union Stock Yards, Chicago, July 7.—Everybody in the beef trade at this time is wanting choice to prime corn-fed cattle, otherwise it is a dull and declining market, the spread in prices between top and mediocre classes having been further amplified. From $13.00 up in the steer trade, prices are as high as at any time this season and from 10@25c above last week's close. Greenish and medium to fairly good short-fed cattle, however, are that much lower, in fact, the more common grassy stuff going downward to $9.50 is frequently quoted 35@50c lower than a week ago and as much as $2.00 per cwt. below the high spot early last month. Ripe corn-fed bullocks are showing up in fewer numbers each week and will from now on. Such classes will continue to charter their own course, but breakers are still ahead for the cheaper grades. South and mid-west pastures are disgorging stuff as fast as it can put on some grease and a free movement out of that territory for several weeks ahead seems certain.

Combined receipts of hogs at eleven leading markets the first five days this week were 167,000 less than like period last week, a considerable proportion of the decrease being attributable to the mid-week holiday. An advance in cash pork product and in provision futures have helped to strengthen the hog market which at the close yesterday showed a 30c higher top and a 55c higher average than a week ago, some light hogs being as much as 60c higher. After more than a week's absence a 16c top was reinstated, one load reaching $16.05 on Friday. The spread in prices, while much narrower than a week ago, is still wide, the general average yesterday at $15.40 being 65c below the top and a good many common heavy packing and some light-light stuff going down to $14.60@14.85. Reports from many sections are to the effect that good hogs have been closely gathered and there is a strengthening belief in trade circles that packers are going to have a hard task cut out for them in keeping the common price of choice corn-fed hogs below the $16.00 notch; in fact, the more optimistic are predicting a recovery in values to and even above the spring high spot. The spread, however, will continue wide.

Packers have made further severe inroads on the cost of sheep and lambs on foot this week, lambs showing at the close yesterday a decline of about $1.00 @ $ from a week ago, and sheep a 50c break. The season's movement from below the Ohio river is under full headway and the vanguard of the range lamb run out of the northwest is helping swell the supply and increasing killers' desire to get prices down to a more workable summer basis. It is doubtful, however, if choice lambs sell down to $15.50 at any time this summer. There are standing feeder orders already for thousands of good feeding lambs and buyers express a willingness to pay up to $15.00 for such goods. Demand for breeding ewes has reached the furor stage and, owing to marked scarcity of such stock, this end of the trade has advanced to new high levels, fancy light native yearling ewes going to the country here yesterday up to $16.00 per cwt.

Top cream of the beef steer supply is selling fully as high as at any time this season and at the highest July levels in market history. Several loads of prime 1,450-lb. branded Herefords from an Iowa feed lot, made $13.90 on Thursday's market, there was a sprinkling of yearlings up to $13.25@13.50 and a fair showing of choice bullocks in handy yearling and heavy weights between $13.00 and $13.50. The proportion of ripe corn-fed cattle, however, is dwindling and the spread in prices is growing wider every day. For the bulk of current beef steer offerings it is a $10.50@12.75 market and there is sizable showing of light to fair weight grassy and warmed up steers down around $8.50@10.00, much of the stuff of current value below $9.50 is $1.50@2.00 lower than the season's high point. It is a very irregular market on all medium and low grade stuff and hard to quote with any degree of exactness.

A few toppy cows and heifers are selling at much the same prices as a week ago, but the market has had an additional break of 25@50c this week on most of the butcher stuff of class to sell under $10.00 on the present market, bulls and canner stuff showing the full decline. Packers have had a big gob of direct stuff from other markets, chiefly St. Louis, and most of it has been a cheap southwestern kind that has had a bearish influence on similar classes on this market. Most of the butcher cows are now selling at $7.50@9.50, only occasional prime heavy kosher cows upward from $10.50. It is largely a $5.75@6.00 canner market and bulk of the decent to good cutters go at $6.35@6.90. Common light grass heifers range down to $6.00, or lower, a meaty killing kind at $7.25@8.00 and only choice corn-feds above $9.50, although there is still outlet for strictly prime baby beef heifers on up to $12.00 and higher, some such being taken, in fact, in mixed lots with yearling steers of toppy class up to the limit of the yearling market. More bulls are selling below than above $8.00, good bolognas going now at $7.50@7.75 that made $2.00 more money on the high spot last month. Some cannery light bulls sell down to $6.25@6.75 and few beef bulls coming are good enough to sell at over $9.25, although $10.50, or better, is quotable for prime corn-feds. Calves are lower than a week ago with the bulk of the good to choice vealers at $14.00@14.50. Stock and feeding cattle values continue on the down grade with most sales 25@35c under a week ago. Traders are looking for a broader demand following the harvesting of small grains, but no active call is expected, at least until there is some assurance of a generous corn crop, as both corn and young cattle suitable for feeding purposes are too high to interest many prospective buyers at this juncture. Sales this week of stock and feeding steers have been largely at $7.50@8.50 with only choice selected classes of fleshy feeders and breedy yearling stuff above $9.25.

While the top on hogs here yesterday at $16.05 was only 30c higher than the corresponding day last week, the curtailed marketing has given the medium and lower priced stuff better standing in the eyes of buyers and a lot of light and mixed packing hogs showed as much as 40@60c advances. Compared with the low spot at last week's closing the general average is more than 50c higher. It is not believed that the country can longer market fat hogs freely, the high price of corn having turned the supply toward the shambles early and deficient in weight and few hogs will be finished on corn at the present price of that cereal. A dozen or more loads of choice heavy butchers sold yesterday at $16.00, but, although quality was of better average than earlier in the week, comparatively few hogs were good enough to pass $15.80. For poor to good mixed and heavy packing hogs sales showed a range of from $14.60@15.25.

HOLSTEIN-FRIESIAN CATTLE.

Milford Meadows Stock Farm

OFFERS FOR SALE a very well-bred bull calf by Dutchland Creamelle Denver Prince (165048) that is better than a grandson of Colantha Johanna Lad and out of Canary Ormsby Johanna De Kol, a 28-pound three year old, 111.95 pounds in 30 days, which is practically a perfect individual. Write for extended pedigree. Other bull calves out of A. R. O. dams by same sire for sale.

EMMONS BLAINE, Prop. Lake Mills, Wis.

KING PONTIAC SEGIS VEEMAN

(134190) IS FOR SALE

A 29.29-Pound Son of King Segis Pontiac Count.

King Segis Pontiac Count is a grandson of King of the Pontiacs, that has more thirty-pound daughters than any bull and is sired by King Segis Pontiac, that has sired more high-priced bulls than any sire.

King Segis Pontiac Count also has the distinction of siring the greatest producing junior two year olds of the breed. He has three junior two year olds that average 28.46 pounds butter in seven days and five junior three year olds that average 31.37 pounds and 610 pounds milk in a week. The herd at which King Segis Pontiac Count stands at the head leads all others in prize winners for A. R. O. work for the year just closing.

For further particulars concerning King Pontiac Segis Veeman write to Edgewood Stock Farm, Burlington, Wis.

Purebred Registered
HOLSTEIN CATTLE

The ideal milk and beef form is represented by the registered purebred Holstein. It has a higher percentage of weight in the hind quarters than any other breed. Its beef is of high quality, Holstein calves are large, healthy and easily raised, and a Holstein steer inherits from its dam hardiness and the capacity to assimilate large quantities of feed. It makes fast weight gains and is a most economical producer of beef. There's big money in the big "Black and White" Holsteins.

10 MORE COWS

OPPORTUNITY RAPS at every man's door. Here is a chance to get some fine animals to found a good herd of registered Holstein-Friesian cattle, for a small sum of money. Cows from $150 to $250. They are bred to Sir Johanna DeKol 19th 64143, a young bull weighing 2500 pounds, with nine A. R. O. daughters, a brother to two world record cows, whose sire has 66 A. R. O. daughters. These cows will soon freshen and their offspring will equal the value of the cows. Also six yearlings to sell at $125 a head. Wire or write immediately, as they are exceptionally cheap.

DR. B. L. WERNER MARSHFIELD, WIS.

A 28.31-lb. BULL

THE ABOVE IS THE AVERAGE RECORD for his dam and sire's dam. His sire is out of the famous 35.43 lb. cow, Pontiac De Nijlander. His dam has a four-year-old record of 21.20 lbs. butter, second dam 17.50 lbs. butter. The bull is a little more black than white. Well grown and a good individual. Born January 27, 1916. For pedigree and further information address

A. M. ANDERSON WHITEWATER, WIS.

RUST BROS.

OFFER the richly bred Holstein bull, Sir Isa Lotta Hengerveld 188663, born Aug. 18, 1915. Ready for service. His dam, Ida Lotta Hengerveld, at 3½ years made 21.34 lbs. of butter in 7 days, 31 days after calving. She is from a long line of heavy producing ancestors, records of her three nearest dams averaging 27.20 lbs. butter in 7 days. She has inherited this heavy producing ability, and transmits it. Sire of bull for sale is Daisy Johanna 5th, 1st prize two year old at Wisconsin State Fair, 1915. His dam has two A. R. O. daughters. Arthur Rust, West Allis, Wis.

BUY HIM NOW

A Jan. 15, 1917, bull calf, evenly marked, tuberculin tested, and a good individual. Sire is a son of Pietertje Maid Ormsby 35.56 butter in 7 days, has full sister with record of 1,255.6 butter in 365 days, average per cent fat 3.95. Dam a 15 lb. 2-year-old granddaughter of King of the Pontiacs. For pedigree and picture write to Walcowis Farms, N. Dickinson & Son, Lake Geneva, Wis.

WE OFFER NOW FOR SALE

DAUGHTERS of Sir Johanna De Colantha De Kol 53056. We have 4 heifers about 6 months old out of him for sale. Price $600. They are nicely marked, well grown and backed by A. R. O. records and rich breeding. We also have a few heifers bred to a 33.68-lb. bull for sale and also several cows bred to the same bull. Prices on application. Inspection invited.

B. F. WINCKLER & SONS Medina, Wis.

Registered Holstein Heifers

HEIFER CALVES AND YOUNG COWS for sale. Ten daughters of the 24.12-pound bull, Sir Korndyke Zoldusky DeKol, that has 10 A. R. O. daughters. He is a grandson of Hengerveld DeKol, that has 116 A. R. O. daughters. These heifers are bred to the 40-pound bull, Johanna King Segis, a son of the 40-pound cow, Johanna DeKol Van Beers. Yearling bulls and younger from A. R. O. dams with records from 14 to 30 pounds. High-grade springers and young cows. Write us your wants.

H. F. McNUTT OXFORD, WIS.

THE ORIGINAL 2-WHEEL TRACTOR

That Does All Farm Work WITHOUT HORSES

When you come to buying a tractor, whether for a farm of 80 acres, 280 acres or more, there are a number of questions you will need to ask yourself before you buy. Here are some of them:

—*Will it CULTIVATE as well as plow?*
—*Will it do ALL my farm work without horses?*
—*Will it work on plowed ground without packing the soil?*
—*Will it do the work quicker; easier; and save on hired help?*
—***Is it REALLY a one-man tractor?***
—*Will it handle as easy as a team of horses, rather than be too heavy, clumsy, and inconvenient?*
—*Do I ride on the tool where I can see the work I am doing, or will I have to have someone run the tractor while I am operating the farm implement?*

The tractor that answers these and all other farm power problems most practically, and profitably is the

MOLINE ORIGINAL 2 WHEEL UNIVERSAL TRACTOR

This is the original Two-Wheel Farm Tractor. It pulls two 14-in. plows; will disc, harrow, plant, CULTIVATE all hill and row crops, pull mower, binder, manure spreader, fill your silo—and do all belt work on the average farm. In fact, it will do anything you can do with horses; do it quicker; easier; and with less hired help. It weighs only 2,800 lbs., but all its weight being on its two wheels—*all its weight is traction weight.* The tool you hitch it to, forms the rear wheels and you do not have to pull around a ton of needless weight. It will back up with tools attached easier than a team will back. You can turn around in a small space; get close to the rows and the fences. It is the ideal tractor for the farmer because it costs less than four horses; is as powerful as five horses; does more work than seven horses; is inexpensive to operate; and eats only when it works.

Write for our new Tractor Catalog and read how farmers everywhere are solving the power and hired help problems on their farms; how they are changing the drudgery of farming to a profitable pursuit. Learn how you can make your work easier and get it done on time and grow bigger, better crops. Write today.

Some Actual Tractor Performance

J. E. Kennedy, Rock County Farmer and Stock Raiser, Gives The Wisconsin Farmer Readers Benefit of His Experiences With Farm Power.

FAITH has given way to performance in the use of the tractor on Wisconsin farms. For several years makers of tractors have found it necessary to give demonstrations and to invite people for miles around to see what the tractor would do and to hear the promises which were made for this wonderful machine. But the missionary work for the tractor is about complete. The tractor has stepped into that realm of certainty backed up by hard experience. And now that it has been firmly established on this foundation, we no longer think of the field engine as a freak performer. Instead, we set it down beside other farm machines and tools which have been tried and tested and which we know will accomplish definite results in the hands of men who will properly use them. It pleases The Wisconsin Farmer to tell at this time of actual tractor performance. Our faith was not lacking when some others feared that the tractor was being overplayed. But we feel that we are now getting down to bed rock, as it is now possible to tell what has been done with tractors on Wisconsin farms. Information like this is more than skin deep; it is convincing. The writer has had any number of invitations from Wisconsin farmers to visit their places and see what a tractor really does, day in and day out, in the season for field work. Only a short time ago we spent a day to great profit with that well-known and successful farmer and stockman, J. E. Kennedy, of Rock county. A great deal of interest could be written about Mr. Kennedy and his farms—beautiful farms, well kept up, well stocked, carefully and profitably farmed. But the purpose of this particular article is not to write up Mr. Kennedy, who, as a man and farmer, deserves a lot of space in any practical farm paper, but to tell about his experiences with tractors. He has had two. The first, a light machine, was a success and would probably have remained on the farm except for the fact that Kennedy wanted a little more power—a machine which would not hesitate when pulling three bottom through either sod or stubble. So he took a step up in the power scale and bought a 10-20 this spring. This 10-20 machine has had a great many nice things said about it. If the thing were animate and could respond to petting as a good intelligent horse can, we imagine this 10-20 would have many affectionate pats bestowed upon it. But the tractor is a machine as we well know, and while we can appreciate its good works we cannot love it as we do a good horse. Mr. Kennedy has a certain amount of respect for this machine, however. He thinks enough of it to keep it in a nice dry shed, where there is a good, hard cement floor and a roof which doesn't leak. While a tractor has no feelings, it will "act up" by way of rusting, if left out in the open fields between jobs. This particular 10-20 is driven into its shed at nights just as the horses are driven into the barn, and after a few days' experience with the tractor the hired man stops trying to throw the lines and shout "whoa." He learns that the tractor doesn't have to be fed when brought in; that there is no bedding to be laid for it; that there is no harness to take off; no currying; just a turn of the lever and Mr. Tractor is ready for a good night's rest. On the morrow the machine needs oiling, a fresh supply of kerosene, a few levers turned and away goes the iron horse puffing and snorting—as frisky as any pair of colts you ever saw, just about as swift and with better staying qualities.

J. E. KENNEDY, ROCK COUNTY, WIS., FARMER WATCHES HIS TRACTOR DISKING THROUGH ROUGH SOD.

NO WONDER MR. KENNEDY'S CORN WAS IN ON TIME—HE WAS PREPARED TO HANDLE IT WITH SPEED.

No sooner were introductions over than we saw that Mr. Kennedy, though a very practical farmer, is also a book farmer. By this we do not mean that he gets his farm knowledge out of books. On the contrary, he works out his own theories right on the farm. But he keeps books as a business proposition. It is his opinion that a farmer ought to know "where he is at" just as much as the village merchant or the country banker. "What would you fellows think of a storekeeper who waited until the end of the summer to count up his cash?" asked Mr. Kennedy. Of course, we all know that the successful business man can't run along a very great while without having definite figures on the condition of his business. So we might speak of Mr. Kennedy as a "cash register" farmer. He knows every night at 6:30 o'clock how many acres of ground were plowed during the day and how much there is left to do. It was corn-cultivating time on the place when we visited it, and Mr. Kennedy told us before we arrived (after referring to his little black vest pocket book) just how much of the corn had been gone over for the second time. And, furthermore, he asked us, with a smile on his face that looked like satisfaction, to note the difference in the height of corn on his place and on some other places the names of whose owners we will not mention. Well, we did notice, and Kennedy is one of the few men in the neighborhood who lived up to the "knee-high by the Fourth of July" corn. So it might appear that it is not always right to blame the late season onto Providence. There are some pretty sparse clover fields this year in Rock county due to winterkilling, but the clover isn't killed on the Kennedy farm by a long shot. Another instance where the Almighty isn't altogether to blame. Kennedy had a good crop of clover last year, cut it only once and didn't let his cattle eat the second crop down too close. The second crop formed a mulch, which protected the roots of the clover and carried it through the winter. Kennedy got a good lot of hay last year, a good lot of feeding off the second crop, and still protected this year's crop, which, without any exaggeration, is the heaviest crop of clover we have seen in Wisconsin this year. So much for careful farming. As stated before, it would be easier to write a book about this farm than a page, and, as it is our intention to discuss tractors, we will have to let Mr. Kennedy's marked success along other lines go for this time.

The Kennedy farm (this particular one—there are several) has 350 acres, mostly level land. It is known as Oak Lawn Farm, a name suggested by the beautiful oak trees and the parlor-like smoothness of the pasture land. Mr.

(Continued on page 5.)

It's Easy to Get at Every Part of this Tractor

THAT'S an important point. No tractor needs less attention than the Allis-Chalmers, but when you do have to grind a valve, take up bearings or make any other repairs or adjustments, you waste no unnecessary time. The design and construction are simple, with all parts easily accessible.

The Allis-Chalmers has a one-piece steel heat-treated frame—no bolts or rivets to work loose—cannot sag under heaviest strains. Vibration is minimized by correct balance of weight and thrust.

Absolutely dust-proof. No dust or grit can possibly get into bearings. That means long life.

Especially strong on belt work. Long bearings of large diameter maintain belt pulley in perfect alignment.

Back of this tractor stand the name and reputation of the Allis-Chalmers Manufacturing Company, for sixty years a leader in the manufacture of high-grade machinery—ask your banker.

ALLIS-CHALMERS 10-18 H.P. FARM TRACTOR

The Allis-Chalmers always runs cool. There is no instance on record of an Allis-Chalmers motor over-heating. Uses gasoline or kerosene with remarkable efficiency and economy.

Write for complete illustrated description of this sturdy tractor and its four years' record in the field.

WAIT Don't pay double prices for Your Separator!

LEARN HOW GALLOWAY PROTECTS YOU WITH PATRIOTIC PRICES—ACT QUICK!

The farmer is being hit harder than ever by higher prices. But my savings on Separators prove you **don't have to pay double prices.**

Write for my FREE BOOK and get the facts

COMPARE! That's the True Test of My New Sanitary

No Separator made at any price will skim any closer, run any easier, or last any longer than my newest Sanitary model. **Tests** by thousands of farmers have **proved it.** Remember, a high price Separator doesn't mean the best. I'll tell you where the extra money goes—the difference between my low price and the cost of other high grade machines. **Just send for my book** and read my Separator secrets and learn all about Separators. I'll tell you why and how much you save when you buy your separator direct from Galloway. I'll prove how this direct buying **saves about half** on the highest class machine and the balance stays in your pocket.

Read This!

Gentlemen: Your Galloway Sanitary Cream Separator which I ordered of you is much easier running and more easily cleaned than the separators which I had just worn out. And besides we have made a saving of $23. I would not exchange it for any of the high priced separators on the market.—Ebb. F. Loethan, R. 6, Carthage, Mo.

Let me give you the name of some one near you where you can see the Galloway

Sold on Trial for 180 Milkings

Take nobody's word. Try it for 90 days yourself. Then if it isn't just what I claim—ship it right back. **I'll pay the freight both ways and refund your money.** Its clean, perfect skimming will astonish you. You will marvel at the ease with which you can operate and clean it. Every part is rounded—no sharp corners for dirt to gather. It runs true in perfect alignment—always—because one casting—the gear case—supports all the gear shaft and both bowl-spindle bearings. The entire gearing has but two high-carbon steel shafts—equipped with long, perfect fitted bearings. All working parts run in constant oil spray. Separating discs separate entirely from each other for washing. **Every drop of milk gets full skimming force** of the bowl. Milk is so distributed that each disc gets its full share to skim.

WRITE TONIGHT FOR THE BOOK!

$39.90 for 375 lb. Capacity
Other sizes up to 950 lbs.

POSTAL BRINGS MY BIG *FREE* MONEY-SAVING BOOK

Don't decide on any Separator until you get the facts on my new direct-to-you offer. Write me this minute—a postal will do. Get my book and learn these Separator price secrets. Learn once and for all this question of Separators. Learn why buying direct from the maker saves you big money on a Separator, Spreader, Tractor Engine and other Farm Implements. This book will open your eyes to Separator values and means money in your pocket. Remember, the risk is all mine. You can try my Separator 90 days. Ship it back if it don't suit. Send for the book. Today! We ship from Chicago, St. Paul, Council Bluffs, Kansas City or from Waterloo factories.

WM. GALLOWAY COMPANY, 33 Galloway Station, WATERLOO, IOWA

Guernsey Breeders' Picnic.

To the Editor:—The Waushara County Guernsey Breeders' Association held its first annual picnic and judging contest at Johns Lake, Thursday, June 21st. Over 300 people were present at the meeting. Several head of full blood and grade Guernseys were on exhibition, and in the judging contest which took place a couple of young Guernsey boys, N. A. Kliefgan and F. Donagan, were awarded first and second places.

Mr. H. D. Griswald, a member of the state fair board and a successful Guernsey breeder from West Salem, Wisconsin, gave a very instructive talk, demonstrating same with the cattle which were on exhibition, following which Mr. Griswald gave a splendid talk on educational and promotion work of Guernsey breeding. Following Mr. Griswald's talk Emergency Agent Brann gave a short, interesting address on silage, clover and cattle, exemplifying the benefits which would accrue to Waushara county by persistent working of this combination.

Mr. C. T. Taylor then gave a brief address on the necessity of greater production, because of the increased demand throughout the cities and nation for western supplies. Mr. W. W. Clark, principal of the agricultural school of Wood county, addressed the farmers on the subject of organizing a cow-testing organization, explaining thoroughly the necessity of and the benefits which would accrue from an association of this nature. Following his address fifteen breeders signed the articles to organize a cow-testing association, and it is believed that the necessary number of twenty-six will soon be signed up.

Too much cannot be said relative to the merits and the advantages to dairymen by having a competent cow-tester inspecting and testing their herds once a month and any farmer regardless of the kind of cattle he is raising can become a member of this association.

The Guernsey Breeders' Association has grown to a membership of fifty-one members, owning over 500 head of pure-bred and grade Guernsey cattle. The membership is increasing from year to year and the herds are increasing likewise, which demonstrates that the Guernsey cattle have proven to be among the most profitable breeders for Waushara county.

Music during the day was furnished by the Mt. Morris Fife and Drum Corps which was greatly appreciated, and the meeting was pronounced a very pleasant success by all present.

H. O. Arveson, Sec.

Favors Conscripting Labor.

To the Editor:—Permit me to mention a few things that it seems to me should be emphasized in the present food shortage crisis.

Like all people, the farmer does his work first and then when more time is available he takes time to listen. We accuse the average farmer for a lack of interest and appreciation of the nation's want for food. Such accusations are unfounded. The farmer is more than busied with the extra work the "greater acreage campaign" of last spring has put upon him. The season is not at all favorable and the farmer is more discontented than ever. He sees his fields overrun with weeds, he sees his crops put in at unusually high cost going to the mercy of insect pests and diseases. All this is going on in the face of one of the greatest labor shortages that the Wisconsin farmer has ever seen. We need every bit of labor we can get and if necessary labor for the farms should be conscripted. I firmly believe that idle hands should be forced into profitable occupation. Vagrancy should be severely dealt with as well as street corner idlers and the like. It should be the greatest misdemeanor for able-bodied men to be found without good, legitimate employment. We must have labor if what we have in our fields may be brought to successful harvest.

Not too much emphasis can be put upon the necessity of a silo whether it be in the extreme north or in the grain and corn belt of the state. It would seem that the lateness of the corn this season will mean an immature crop with only a part harvest of the fields put in corn this year. The fodder which we shall find extremely high-priced as the feeding season advances must be kept for winter use and a silo seems and is the only means by which it can be done efficiently and profitably. Our cry is, "A silo on every farm—two are better than one."

Potato crops are going to be sacrificed if we do not watch and guard against the disastrous potato blights. We must harp unceasingly spray—spray—spray, not merely for the bugs and beetles, but the deadly blight. Not only is the usual crop in danger of loss, but all the added acreage and seed as well as labor invested in the campaign for more and greater production.

Let our farmers know the truth of our present situation in regard to food shortage and you never will find a more loyal patriot. He needs help on the farm to make the most of his possibilities. I have the utmost faith in the farmers of the nation; if necessary he will not only do his duty on the farm, but will prove himself as good a soldier as he is a farmer. My hat goes off to him every time.

Rufus R. Runke,
Emergency Food Agent.

Does All These Things With a Tractor.

To the Editor:—I am using an 8-16 tractor on my place and my experience shows that I can plow about seven acres of good, hard ground in ten hours. I can pull two or three spring tooth harrows, owing to the condition of the soil on my place. I can pull a binder, haul in the hay, load with a loader, pull my clover huller and grain thresher, grind feed and saw wood. My tractor is also a dandy to move heavy stones with. I have never tried to pull stumps, but I would think it would pull as much of a stump as eight horses and possibly then some. I am fully convinced that this tractor will do as much plowing and dragging as three three-horse teams, and do it every day, and I would never have a sick horse on my hands, and this work can be done on about thirteen gallons of kerosene and two quarts of oil. No farm can be fully equipped nowadays without a tractor. I have had mine two seasons and I am thinking of getting another one, that is, a 10-20.

Geo. H. Wunderlich.
Langlade Co., Wis.

Ayrshire Does Her Bit.

To the Editor:—The seven-year-old cow, August Lassie, owned by the Lawrence A. Reymann Estate, Wheeling, West Virginia, has completed an official yearly record of 19,582 pounds of milk, 831.50 pounds butter fat, test 4.11 per cent.

August Lassie was born August 8, 1910, and already has three official records to her credit. On February 1, 1915, she completed her first official advanced registry record, producing 10,047 pounds of milk, 398.24 pounds butter fat. On March 13, 1916, she finished her second record with 17,784 pounds milk, 720.03 pounds butter fat, test 4.05 per cent, and her third record just completed 19,582 pounds milk, 831.50 pounds butter fat, test 4.25 per cent.

The completion of this last record gives August Lassie a three-year cumulative average record of 15,791 pounds milk, 649.92 pounds butter fat, 4.11 per cent test. J. G. Watson.

Potato Outlook Is Good.

To the Editor:—We are conducting a campaign on potato bug control and at the present time I regard this as of the utmost importance, as a cultural operation which should receive attention of potato growers. We find that the potato beetle infestation is not so serious in some sections of the state as it would have been had we had dry, hot weather. Reports coming to this office indicate that the potato crop is in very good condition and in all our important crops in Wisconsin I believe there is none in better condition today. Should we have a normal season during July and August the chances for a very large crop of potatoes is good. J. G. Milward,
Assistant Professor in Horticulture,
Wisconsin College of Agriculture.

FAMILY CIRCLE TALKS BY THE PUBLISHER

YOUR WAR AND MY WAR.

I AM in receipt of a letter which I cannot let go unanswered and unrebuked. It is so different from the vast majority of the letters which come to me from my farmer-readers I can hardly realize that one of the prosperous farmers of this highly productive grain belt of ours wrote it. In a way it is so unpatriotic as to lay the writer open to the serious charge of treason, yet I cannot bring myself actually to prefer such a charge against him, for I believe he wrote to me in good faith, not realizing the extent of his guilt. Let the letter speak for itself:

Dear Mr. Pierce:—While Europe is in need of our help, there are thousands of mothers throughout the United States today weeping because their sons must go to the land of destruction, full of misery, hunger and disease. Those who have no sons to go are shouting and telling what ought to be done. But we poor parents do not want to see our sons go where they go to their death, on foreign land, 3,000 miles away from father and mother.

It seems strange to me that there cannot be a war anywhere in the whole world, but the United States gets into it. Look at the Cuban war, the trouble in Mexico, and so on. Does our government think we like to raise our boys to shed their blood for all the nations of the world? We elected President Wilson thinking he was the man to keep us out of war. Has he done it? No! Our best young men, that we raised from babyhood up to where they can do us the best of good, must now lose their lives and good health in a war 3,000 miles from home. Shame! It looks as though all any nation has to do is to go into war and then get the sympathy of the United States and away our boys go, regardless of dear parents, wives and children. They go not only to France, but anywhere there is war. Let's stop. If any nation gets into war they should see and know how to get out or else not get in. I am for the United States only; for war, never! Where is the song "I Didn't Raise My Boy to Be a Soldier"?

I shall not print the name and address of the writer of this letter, for I believe the time is not far distant when he will regret every word of what he has written. I cannot let the occasion go by, however, without expressing my views, positively and emphatically.

There is no one who detests war more than I do, as all of my readers who have done me the honor to read my recent writings must surely know by this time. I know what war means, from bitter experience. I know what it is to have a father buried in an unknown southern grave, where he fell, before Vicksburg, fighting for liberty, even as our boys will be fighting tomorrow in the trenches of Europe. I know the heartaches and sorrows of the mother and her large family, deprived of their chief means of support. I know the hardships of going to work to help support a family as a boy, of walking long distances to work and of trying to take the place of a man, when I ought to have been at school. I know, too, the duties of military service, for, as a lad of fifteen, I volunteered to help repel Morgans raiders from Ohio. I say I know the sufferings, the pangs, the awful brutality of war. But there are worse things than death and suffering, for no nation, no ideal is worth living for unless it is also worth fighting and suffering and dying for. It is the duty of all of us today, as never before since the civil war, to present a united front to the enemy of humanity in supporting our state and national governments in their prosecution of the war to an everlasting peace and final victory for the righteousness that exalteth a nation.

Don't deceive yourself, my misguided friend, with the idea that this is not your war, for it is to your interest as much as to those of the farmers of England that the United States play her part and that her boys and men and women meet the sacrifices that will be necessary as bravely and patriotically as those of France, England, Belgium and the other allied nations of the earth have done for years. It would be our eternal shame and humiliation, our disgrace and our destruction if we did not rise to this occasion. I did not raise my boy to be a soldier either, but I am proud to think that when the occasion arose for him to be a soldier he responded in the Spanish-American war and if he were needed he would respond again, even as I would if it were necessary, in spite of my years.

This never was England's or France's war alone—it was humanity's war. Today it is also America's war, Missouri's war, Iowa's war, Wisconsin's war—your war and my war. It was started, not by the great common people of Germany, whom I admire, but by an autocratic, power-seeking military caste for the purpose of world dominion, just as every other great war lord in history has sought world power. I do not see how any man can read the history of the beginning of the war, the story of the rape of Belgium, the defiance by the German government of all sacred treaty rights, the plots for years against the United States, without realizing that this was not a European family quarrel, but a struggle for the eternal principles of democracy and liberty all over the world.

I firmly believe (and the story of Germany's diplomatic intrigues in Mexico and South America bear me out in it) that if our allies had been defeated America's turn would have been next and we would either have had to fight the greatest military power on earth alone and unprepared, or else have bowed our heads under the German imperialistic yoke and furnished tremendous war indemnities to Germany when she was swollen with the pride and lust of victory. For my part, I prefer to take time by the forelock and get ready and fight with the aid of the other democracies of the world in their common effort for final universal peace, rather than to have to face the issue single-handed.

These are my honest, earnest views, and I shall adhere to them with the last breath of my body. I did what I could to avert war, but when it came I realized that it was inevitable, that it must be fought out to the bitter end to insure that everlasting peace which shall give to every man the right to work and to enjoy the fruits of his labor undespoiled by the avaricious hand of the tyrant. This is the war of the farmers of America, as well as the soldiers. It must be won by both, one in the field and the feed lot, the other in the trench and redoubt. Shoulder to shoulder, in spirit, they must charge the common enemy and drive the tyrant from the face of the earth, which he would cover with monuments to martial glory rather than with ripening crops and grazing herds, smoking factories and other evidences of peace and plenty and prosperity.

I hope the man who wrote me the letter which occasioned this reply of mine will write me again and that this second time he will admit being ashamed of what he wrote before, and will pledge himself to stand by the stars and stripes wherever and whenever they may wave for decency and democracy; for honor and home; for truth and righteousness and God.

FARM LOAN BONDS ON MARKET.

FARM loan bonds, issued by the various federal land banks to provide money for five per cent loans to farmers, are now upon the market and I am advised are meeting with a ready sale. I am in receipt of a circular from a well-known bond house, advertising these bonds as gilt-edge investments, which I believe them to be. They bear 4½ per cent interest, but are selling at 1⅛ per cent above par, or face value, which makes them net 4¼ per cent. Being free from federal, state, municipal and local taxes they are especially attractive to investors and I cannot see any reason why the public will not take them up in such quantity as to insure the federal land banks having plenty of money to meet all desired loans.

I am advised that a total of $11,661,905 in mortgage loans has been asked of these twelve government banks by the 230 national farm loan associations already chartered. There are applications for $100,000,000 more now pending, but not yet approved. It is slow work getting the local associations of ten or more farmers organized, their charters approved, the farm land appraised and all the necessary details arranged. Yet I continue to have faith in the system and hope that bit by bit the red tape may be lopped off, so that every worthy farmer may be able to avail himself of the opportunity to get ample funds from Uncle Sam at a low rate of interest and for as long a time as desired. I am advised that most of the loans so far made to the local associations run for thirty-six years and are to be retired by semi-annual payments. As I have frequently stated, a six per cent annual payment by the borrower pays the interest and retires the principal in thirty-six years, so that the mortgage never really comes due.

A number of banking and bond houses have joined hands and are going to take half of the bonds issued by these federal land banks within the next six months, up to a total of $30,000,000. The government confidently expects that it will need to issue $100,000,000 to $150,000,000 worth of farm loan bonds within a year, the demand for money being steady. The farm-mortgage indebtedness of the nation, according to the last federal census, was $1,726,172,851, so that the loans already approved amount to only two-thirds of one per cent of the whole amount. The effect is noticeable, however, in the reduction of interest rates by insurance companies, banks and individuals, so that the law has worked some good even thus early in its existence. I predict that greater good will come from it within the next few years.

HELP IN THE FARM KITCHEN.

I AM glad to note that a farm woman has raised her voice for fair play in the matter of help in the present crisis. Why should every energy be strained to give the man the aid he needs in the field and absolutely nothing be done to give the woman the assistance she needs fully as badly in the kitchen? Let us be fair in all things, especially in the treatment of those of our own household.

I cannot introduce the subject to your consideration better than to quote the letter of the farm woman who raises the point, as follows:

Has it occurred to any to volunteer their services in helping the farmer's wife as well as helping the farmer? So many of our patriotic women seem eager to drive an ambulance or join the signal corps, but I have not seen a large list of those who are willing to don a checked apron and handle a mess for the additional farm laborer. It is, of course, much more picturesque to have one's photo taken in charming khaki trouserettes seated on a tractor; but isn't it equally patriotic and fully as important a "bit" for the woman patriot to stay in the kitchen of the farm where she is so badly needed?

Many of the men urged to go and work on farms have complained that they would be willing to go if their wives (in the city) would allow or encourage them. Now, why is it not practical for the wives of such men workers to go along to the farms with their husbands, and do their share by cooking and helping the country housekeeper? Never was it more difficult to secure kitchen and house service in the country. Why not put up tents or small barracks on the large farms, and have the women accompany their husbands and work at cooking, and later at canning, while their husbands plow and reap? This might be a solution also of the charge against the unmarried floating farmhand, who disappears on Saturday night or who is rendered less fit by weekly sprees.

We cannot have the maximum of production in the fields and feed lots until there is the maximum of efficiency and of happiness in the home. An overburdened farm wife, worn to a frazzle over the hot range in canning or harvest season, obliged to care for a baby and a brood of little tots, the sole worker in a ten-room house—without encroaching in the least on our discussion of what I called the "libel on the farm woman" in a recent magazine, are we not justified when we stop to inquire if this is getting the most out of life, if it is being fair to our women folks, if it is making country life the ideal, uplifting life that it should be and could so easily be made? Shall we not see to it that the wife and the mother in the kitchen have the necessary help, as well as the husband and the father in the field? Think it over.

There is a great and far-reaching responsibility on the women of our land today, both those of the country and those of the city. A grain-belt preacher, in a sermon last Sunday, hit it off admirably when he said:

I rode the other day up the valley, and, as I saw the waving fields of green, it seemed they were waving banners of our great warfare. Do you know that a tablecloth may be a banner also and that above that banner there is wasted an average of $50 a year by every family in America? The waste of a single ounce of food every day in every home means a yearly waste of nearly one-half billion pounds of food. The waste of a single slice of bread daily in every home means the daily waste of a million loaves. I have quoted these figures from the government's food expert. Because I am a preacher I should like to add the plea that you make your tables an altar and your frugality a sacrament of freedom. Go home then today to your tables and let their white coverings be to you as the banners of humanity's war for freedom and the right. Away from that snowy banner stretches the toil of a world. But away from it also today there stretches the hopes and fears of God's crusaders. May their shouts of victory never be drowned by hunger's cry because we have failed. It is that the fighters may have a fair chance in God's warfare and humanity's that you are asked to save your bread and help save their battle.

The red, white and blue in the trenches must be supported by the green in the fields and the snowy white in the kitchen and dining room. They are banners which will lead us on to victory if equally supported; to let any one of the three trail in the dust is to tempt defeat.

THE WISCONSIN FARMER, Madison, Wisconsin

The Tractor and Farm Production.

There should be no occasion for conflict between the advocates of the draft horse as an agency of farm power and those who favor the use of the tractor for the same purpose. In order to keep the nation at the highest point of production during the present conflict we will have to put every available animal into the collar, and, in addition, every reliable tractor that can be turned out from our factories. The day for quibbling over the superiority of one form of power or the other has passed and when this paper undertakes to say that there is an important place on the farms of the Central West for the tractor, it is not implied that the horse is condemned as an economic unit of power.

In this issue of The Wisconsin Farmer will be found the record of a number of instances that have come from men who have had experience in handling the farm tractor, and these speak for themselves. No effort has been made on the part of The Wisconsin Farmer to present the experience only of those who have had good success with the tractor, and, if there is more comment that is favorable to the tractor than otherwise, this is because our readers have so expressed themselves.

One expert on farm power points out that there is more energy spent in plowing the soil of the United States annually than is used in the combined factories of the land during the same period. This means an enormous horse power, and yet there is no denying the fact that a great deal more power should be used, because, on the whole, our soils should be plowed much deeper than they are at the present time. We have been content in the past with turning the furrow four or five inches deep whereas, unquestionably, there are many types of soils that could be advantageously plowed six, seven and eight inches deep. It will be the tractor rather than the horse that will meet this new emergency and thereby increase production without enlarging the area under cultivation by simply making each acre do more. Those who have large draft horse investments and who regard the coming of the tractor as inimical to their best interests should consider this fact. Certainly the horse is not equal to the task of plowing a deep furrow at anything like a moderate cost, whereas it has been proven over and over again that under ordinary conditions the tractor will plow land deeply and do the work economically.

Those who have given the tractor a good try-out are not slow to point out its advantages. Machinery does not tire, and temperature has no effect on the working ability of a tractor. It gives service alike in hot and cold weather. There are no colicky pains to contend with and there can be no sudden collapse which corresponds to the death of a work horse. When a part becomes broken it may be quickly replaced, so that on the whole the modern tractor may be depended upon to go through a work season with but little interruption.

In the very necessity of the case many farm operations should be performed quickly. At the outside, there is only a period of two or three weeks for spring plowing, and, should the weather be unfavorable, this means, under ordinary circumstances, a late putting in of the crop. It is in this respect that the tractor literally makes good, because it can be put into forced service. Many instances have been called to our attention this spring where the tractor has been worked twelve and fifteen hours a day. Indeed, cases have been called to mind where headlights have been used and the tractor worked constantly, day and night. If it is true that the tractor is handicapped by undue wetness of the soil, then this disadvantage is offset, and, indeed, more than offset by the advantage here referred to. Tile drainage will in the end solve the problem of wet fields and remove the most serious handicap to the general introduction of the tractor. Wet lands in any event are seldom productive, so that in preparing the way for the introduction of the tractor we are getting ready for a more improved type of agriculture that will lead to increased production.

As before intimated, this paper is not specially interested in making any odious comparison between the tractor and the horse, because each will find its own sphere. Those who wish to compare the cost of tilling a given acreage with horse power and with tractor power will find instances in this issue of The Wisconsin Farmer. A careful reading of the data here presented will show that the tractor does not suffer by comparison with the horse in cost of tilling an acre of land. Indeed, the tractor shows up very favorably, even though a year's experience or two years' experience does not throw much light on the annual depreciation.

Winterkilling of Alfalfa.

There are many shabby looking alfalfa fields all over the Central West and, of course, thousands of fields were plowed up and put in corn. The individual who sustained a loss of a field or two is not very much concerned about the question of his loss. He knows in a general way that the winter was too cold and the crop did not have enough snow protection. The strange part of the matter is, however, that some fields escaped. Others were half killed, while still others were completely destroyed. This is well illustrated in a letter by C. S. Burgess, which recently appeared in Field's "Seed Sense." It reads:

In reply to "What killed alfalfa?" I will try and tell you of a few fields in this community. I have three small fields of old stands; the oldest about thirty years, one ten and one four. There is some dead in all three fields, but more in the ten-year piece than in the other two combined. Another field just across the road on clay banks and bottom of draw is a piece nine years old that is nearly all dead and about forty rods farther on is another field on same kind of ground, three years old, that is a good stand. On the next eighty east of here are six acres ten years old, on good level ground, of rich loam, that is all dead. A short distance farther is ten acres, sowed last year, that is a perfect stand. All fields sowed in May without a nurse crop. None of these fields were pastured and all are well drained. That is, there is no water standing on them. I have talked with several farmers about their alfalfa and most say it is about half dead. I don't advance any reason, nor have I heard anybody that could give a cause for the conditions around here. But what killed the salsify and wheat and most of the parsnips has proved to be mighty hard on alfalfa. These are the condition in this part of Nebraska.

It is singular, indeed, that the thirty-year-old alfalfa field suffered less in the case cited by Mr. Burgess than one that had been established ten years. On the whole, the oldest field suffered most. We have in mind one instance where alfalfa, seeded five years ago, was practically all killed, whereas another two-year-old adjoining field, with a soil exactly similar, came through the winter in splendid shape. The experience that alfalfa growers have passed through indicates that the common variety is not absolutely hardy, and sooner or later we will have to use the Grimm variety. To be sure, there is not enough seed of that variety to answer the immediate needs of all who wish to establish alfalfa this year, but it is not too early to begin giving it a try-out on a small scale.

More Rye and Wheat in Wisconsin.

The success that accompanied the appeal from the various agencies for more wheat in Wisconsin last spring and which resulted in an acreage increase of 33 per cent will be repeated during the coming weeks in an effort to encourage the seeding of more winter wheat and rye.

The millers and farmers of the state will work together with the Wisconsin Bankers' Association, the college of agriculture and the Wisconsin Experiment Association in order to make the undertaking a successful one.

The State Millers' Association is to meet at Neenah, July 20th and 21st, for its annual convention. The rye and winter wheat seeding question will be the chief topic under discussion. Plans for organizing the millers of different localities, the grain dealers, bankers, merchants and farmers in order to carry the campaign into every section of the state where the growing of wheat and rye is possible will be worked out at this meeting. The labor question and the problem of securing seed for planting will also be thoroughly discussed. The biggest factor in solving the seed problem will be the coöperation of the State Agricultural Experiment Association with its well-organized county orders.

There is room for more wheat and rye growing in the state. Profits from both crops are possible in a greater degree than generally admitted. The millers' convention is doing a good thing for Wisconsin in aiding in every possible way the increase of these necessary food products in these serious times.

Itinerary of Land Clearing Special.

The first local demonstration of the Wisconsin land-clearing special is in progress at Murray, Rusk county, as this issue of The Wisconsin Farmer goes to press. The itinerary of the special for the balance of the trip is as follows:

Kennan, Price county, July 23d to 28th, S. M. Sargent, Phillips; Holcombe, Chippewa county, July 30th to August 4th, A. J. Edminster, Holcomb; Joel, Polk county, August 6th to 11th, John Klinka, Balsam Lake; Frederick, Uolk county, August 13th to 15th, John Klinka, Balsam Lake; Siren, Burnett county, August 15th to 18th, G. M. Briggs, Grantsburg; Hines, Douglas county, August 20th to 25th, J. M. Walz, Superior; Brill, Barron county, August 27th to September 1st, R. L. Cuff, Barron; Seeley, Sawyer county, September 3d to 8th, C. P. West, Hayward; Washburn, Bayfield county, September 10th to 15th, V. E. Brobaker, Washburn; Mercer, Iron county, September 17th to 22d, John Kendrigan, Mercer; Merrill, Lincoln county, September 24th to 26th, A. H. Cole, Merrill; Rhinelander, Oneida county, September 27th to 29th, W. D. Juday, Rhinelander; Phelps, Vilas county, October 1st to 6th, Oscar Gunderson, Eagle River; Laona, Forest county, October 8th to 13th, John Swenehart, Crandon.

Editors of The Wisconsin Farmer have accompanied other similar special trains and witnessed the demonstrations, and it is our advice that all farmers and settlers who can possibly do so visit the demonstration grounds at least one or two days. The demonstrations cover practical methods of land clearing. Don't miss the demonstration in your neighborhood.

What a Wisconsin Farmers' Club Did.

For the benefit of those who belong to a farmers' club or would like to belong, the following letter written for The Wisconsin Farmer is reproduced:

To the Editor:—The Fairview Social Club, of Black Earth, Wis., was organized May 5, 1916, for the purpose of promoting social activities and for the discussion of farm topics. The club has forty-three members and sixteen honorary members, the majority of whom are at each meeting.

Besides many social gatherings, the club has conducted several projects which were beneficial to the farmers. Two of these projects were a crow and hawk hunt, resulting in the practical extinction of crows from the neighborhood, thus saving the corn crop, and a June bug hunt. The June bug hunt lasted a month, there being two sides working under their respective captains, who kept count of the number of bugs caught. It was discovered that the best time to catch the bugs was between the hours of 10 and 12 p. m., as bugs by that time had alighted on the trees and could be shaken off easily onto a canvas, gathered up and destroyed. The trees the bugs seem to feed on most are the butternut, hickory nut and walnut. By the method described 62,346 bugs were caught, which, if allowed to live, would have produced, according to statistics, 4,987,680 grubs. In any contest conducted by the club the losing side furnishes a supper, so there is always something in view for the winners. Floyd Drake, Secretary.

Surely our readers will see in this letter a practical illustration of the value of community organization. This letter simply suggests what may be done. There are any number of things which a live farmers' club may do for the neighborhood.

Help Gather Badger Crops.

A good crop of small grain and potatoes is in sight and a pretty fair prospect for corn. The thought in the minds of farmers at this time is how they are going to get sufficient labor to harvest the crop. This is a problem in part for the individual farmer who will have to work early and late and the members of his family will have to do all in their power to help him. But there is every reason to believe that the farm help now on farms in this state will not be sufficient to gather and store all the crops. This being the case, the matter becomes a problem for the state council of defense and The Wisconsin Farmer is pleased to note that it is being given attention in many counties. It was not enough to urge the farmers to plant and cultivate intensively. The harvest is just as important. It is not an easy matter to sit in an office and advise how this is to be done. But some suggestions are being worked out which may well be given publicity. In some neighborhoods clerks in stores, banks and offices will be relieved for several days during harvest and ordered to the hog and grain fields by their employers. In case the employers think they can do more in the field than the clerks the "boss" himself will in many cases get back to the farm for a few days. In order to systematize the work of the volunteer army of crop gatherers the emergency food agents in each county are trying to list all men who will aid in harvest. In the Dane county newspapers will be found a blank which reads like this:

Dane County Council of Defense:—

I agree to offer my services to help harvest the crop of Dane county during the months of August and September and am willing to be assigned by the Dane County Council of Defense to any farm in Dane county for a period of ..... weeks.

Signed.....

This provides a convenient means of enlistment in an army just as important as the army at the front.

Probably by the time this issue of The Wisconsin Farmer reaches its readers the conscripted army will have been drawn. This will take away a great many men who might otherwise work in the harvest fields. Other sections of the country and Canada are also bidding high for the workers who will be left. Young men have left us to join the guards, the regular army, etc., and our factories and other institutions are working full time, so there is no doubt that labor will be scarce. We strongly urge all communities to afford to county councils of defense the fullest coöperation in this work. It would be little short of a crime to raise a bumper crop and fail to harvest all of it.

Tractor For Stump Pulling.

Louis Helson, of Webster, Wisconsin, writes as follows:

I have broke about twenty acres with tractor this spring, and before this pulled the stumps on the same ground. These were green jack pines up to six or eight inches. The cost of working with the tractor was about $1.50 per day. This same tractor has pulled the manure spreader, disk, harrow, plow and I am going to use it soon on the road grader. My tractor is an 8-16 and pulls two gang plows easily, plowing up to six acres a day.

The tractor is being used quite extensively in pulling stumps. Our readers will be interested to know that the Wisconsin State Fair is to have a tractor demonstration this year in connection with the fair September 10th to 15th. The big national tractor demonstration and show is on at Fremont, Nebraska, August 6th to 10th. While stump pulling will probably not be demonstrated at either of these shows, it is well for the prospective tractor buyer to keep this added utility in mind.

Some Actual Tractor Performance.

(Continued from page 1.)

Kennedy was not easily converted to the tractor. Before he had a tractor he worked twelve good, sturdy horses on this farm. When the tractor came on the farm six of these horses went out. They were sold for $1,500—an average of $250 each. The tractor cost $1,000—the last one—and right here Mr. Kennedy was $500 cash in pocket. Just as soon as the 10-20 reached the farm it was given a severe test. It was started down through sod ground, seeded down for about twelve years, and turned the trick, or rather the furrows, at the rate of eight acres a day, pulling three bottoms through the sod with ease and dispatch. One of the pictures shown herewith gives an idea of how this tractor disked this turned-over sod which was so rough that it was necessary to weight down the disk as shown in the picture. This man Kennedy of whom we write, is standing looking at the tractor's performance, and as this is "Jack's" first and only photograph, according to his own statement, better take a good look at it. All this plowing and disking was done with one man at the helm, or rather wheel, of the tractor. In another picture shown herewith, the tractor is busy disking and pulverizing, with a double horse team following with a harrow, another team following with the roller, and a fourth team winding up the operation with a planter. In order to keep history straight on this horse business on this farm, let us say that the extra team here was borrowed from a neighbor for the day, and is not a part of the Kennedy farm live stock. Kennedy felt he was a little late with this corn and he couldn't wait until his own teams on the harrow and roller were through. That's an example of good farming and economic farming. When you need an extra team just for a day or two, just hire 'em, instead of investing $500 to $600 to keep 'em on steady. That's always providing that it is possible to get an extra team. Mr. Kennedy's strong point in farming is in always getting what he needs and when he needs it.

Well, the outfit as shown in the two pictures of which we have spoken, cleaned up fifteen acres a day, and that's putting in corn pretty fast. The tractor was largely responsible. Mr. Kennedy says that on this particular job it would have been necessary to have had twenty horses to accomplish what he did in the time he did. This first test earned the 10-20 a permanent stall on the Kennedy farm.

Knowing that Mr. Kennedy keeps books a natural question was what it cost him to keep up the tractor. Somewhere in the funny papers we have heard about "it's not the cost, but the up-keep." Mr. Kennedy made the flat statement that it costs about 25 per cent as much to keep up the tractors as it would cost to keep up horses sufficient to do the same work. The 10-20 on an average takes the place of six horses—sometimes it does the work of eight horses. Mr. Kennedy has kept careful count of saving in labor. He figures that it takes twenty minutes per horse, or two hours four times a day, to hitch, unhitch, feed, etc., so he keeps regular hired men. When you figure this labor time lost on six or eight horses it means a labor cost of an extra man regularly so long as the horses are working regularly. This time is figured from the time the hired men say "whoa" at the barn until they are on hand at the back door clamoring for grub. Most men don't figure this labor cost against their horses. But Mr. Kennedy does, and that's where he's a little wiser than some of the others. Furthermore, Mr. Kennedy knows how much it costs to keep a horse a year on 75-cent oats and $20-a-ton hay. He figures it costs just $165 per horse per year on the average. He says that his tractor has displaced six horses and hence there is a saving of six times $165 or $900 a year. That's enough to buy the tractor.

But we know our readers will say there is some cost of operating the tractor and that, while the machine doesn't eat oats or $20 hay, it does consume fuel, and we shall talk of that just a little later. The cost of operating the tractor when it is not in use is practically nothing. It doesn't require nearly so much space as six horses—in fact, not any more than a team. But the feed bill for the horses goes right along, work or no work, and it doesn't take any science to prove that horses with nothing to do will "eat their heads off" on present feed prices.

Surely we'll all be interested in the fuel costs of Mr. Kennedy's 10-20 tractor. It takes about one and a quarter gallons of kerosene to plow an acre of corn or oats stubble. This kerosene can be gotten for 8 cents a gallon, if you go after it, or delivered on the farm for 9 cents a gallon. While the tractor uses chiefly this cheap grade of fuel, it is necessary to have a supply of gasoline on hand for priming to get the engine well started up. Just as soon as it is heated the kerosene will do the work. Mr. Kennedy finds that his engine uses on an average of five gallons of gasoline a week. This gasoline he buys delivered at the farm for 22 cents a gallon. Add to this the cost of lubricating oil, of which three gallons a week at 21 cents a gallon are needed, and you have the fuel cost of operating this tractor for a week. Let us set it out in table form so that we can see it better:

65 gallons kerosene	$5.85
5 gallons gasoline	1.10
3 gallons oil	.63
Total fuel cost	$7.58

For this fuel cost, plus the added cost of the man to operate the tractor and the cost of investment in the machine and depreciation, Mr. Kennedy averaged fifty acres of plowing in corn or oats stubble in a week's time. For plowing sod ground he says to add ten gallons of kerosene and let the other figures stand as they are for stubble ground. So the additional fuel cost for sod ground on the Kennedy farm is only 90 cents, or call it a dollar in round figures, and say that $8.58 will run the tractor a week and plow fifty acres of sod.

Is it necessary to elaborate on these figures? We believe they are very understandable and we vouch for them as being the actual costs kept by Mr. Kennedy on his regular farm work. Mr. Kennedy figures that feed for six or eight horses necessary to do the work of the tractor would be close up to $20 a week. As feed is fuel for the horses we have a fair comparison of fuel costs in each instance. The care of tractor and teams (outside the hitching and feeding to which we have referred) about offset each other so far as length of time is concerned. In other words, oiling, fueling and care of the tractor takes about as much time, when the machine is working, as currying and cleaning the horses and harness. The big difference comes in that the horses require this work when they are unable to do any service on the farm, while the tractor in its days of idleness requires no work at all.

Can the ordinary farm hand run a tractor? The answer on Mr. Kennedy's farm is "yes." It was near the first of July when we visited the Kennedy farm. The engine was bought in April. The man who set it up stayed two days to show the boys how to run it. The hired man has since kept the tractor at work when needed and the man who made the sale hasn't even been back to look at it. Mr. Kennedy claims a tractor is just a little bit easier to run than an automobile. If you don't think a farm hand can run a car over the country roads, offer him the use of the car to take his best girl riding and see what a wonderful knowledge of practical mechanics will suddenly loom up in him.

Is the tractor good for any other work than plowing? Mr. Kennedy again says "yes." He used his small engine last year to grind all the farm feed. He used it to fill a big silo. This year the 10-20 will fill two silos, Mr. Kennedy having caught the spirit of silo building and erected a twin to the big brick silo he already had. Furthermore, Kennedy is helping serve his country by raising a spring wheat crop which looks fine and his wheat and oats will be threshed this year with his own small separator, run by the belt power from the tractor.

The Kennedy tractor started plow-

"My Repairs Were Only 40 Cents"

"I have plowed hundreds of acres with my Heider, pulling three fourteen-inch plow bottoms," says one farmer, "and in one year's time I have had only 40 cents worth of repairs."

Do you know of any other tractor that can equal this record? It was taken from but one of hundreds of letters we have received from Heider owners. The Heider is unlike other tractors in construction and unlike them in the extra economical service it gives you. The special friction transmission, sometimes called the greatest single feature ever built into a tractor, means less gears, fewer parts, less trouble, less chances for breakage, and lower upkeep cost. Nine years of constantly "making good" are back of the

Heider

Made and Sold by the

Rock Island Plow Co.

Here's the practical one-man tractor for *your* farm. Easy to control, start, stop or reverse, all with one lever. So simple that one user says, "I put my youngest boy on the tractor and he does the plowing."

Standard four-wheel construction; four cylinder, heavy duty Waukesha Motor. Highest standard of accessories. Backed by 62 years of manufacturing successful farm implements, and the Rock Island reputation for quality in all parts of the world.

Two models, Model C-12-20 H. P. illustrated above, pulls three plows. Model D-9-16 H. P. pulls two plows (Note the special plow equipment on Model D).

What are *YOUR* power needs? Let's show the answer to them in Heider construction. Write for our new catalog and booklet of "Owner's Say So." Know the economy of owning a Heider—the tractor that gives you all your ideals in one outfit.

ROCK ISLAND PLOW CO.

411 Second Avenue **Rock Island, Illinois**

Also manufacturers of the famous line of Rock Island Farm Implements, including Discs, Plows, Planters, Seeders, Cultivators, Listers, Hay Rakes, Hay Loaders, Manure Spreaders, Litter Carriers, Gasoline Engines, Stalk Cutters, etc. Write for catalog.

Get Good Plowing No Matter What Tractor You Own

No one has been able to beat the plowing made possible with the Rock Island front furrow wheel lift tractor plow with "CTX" bottoms. It's ready for any soil—and the pull of any tractor. Extra high clearance. "CTX" bottoms turn the furrow slices clear over and prevent air spaces from stopping moisture. This means increased crops. Write for catalog.

Model D-9-16 carries two Rock Island No. 9 plows. Handiest plowing outfit you could own. Your hands operate the tractor while your foot raises or lowers the plows. Automatic power lift. Gets into fence corners easier than you ever could with a team. Sold with or without plows attached. Write for special circular.

Heider Tractors Burn Kerosene, Gasoline or Distillate Fuel

ing April 10th. It was put up May 19th. It plowed 180 acres of land, sixty of which was the rough sod of which we have spoken, and double disked 160 acres. It pulled three bottoms all through and not a share was changed. Thus the 10-20 stands on its record.

Mr. Kennedy has made one change in his farm as a result of the tractor. He has cut out some fences, making his eighty-rod fields a half mile in length and saving turns.

The fifty head of pure-bred Short-horn cattle on the Kennedy farm would be hard to beat. But this is another story. Perhaps we may get a chance to tell it some other time. He has a junior yearling bull calf, thirteen months old in June, a son of Selection, grand champion Short-horn bull at Chicago in 1909, which is about as promising a bit of bull as we have ever seen. His herd bull is Maxwalton Amateur, by Maxwalton Renown, famous show bull son of Avondale. This is a herd of Short-horns where money doesn't seem to talk at all—at least, not for the choicest stuff. Mr. Kennedy takes the position that there is no price on the cream of his stock unless he decides to go out of the cattle business. "Why sell bulls and cows which I can't duplicate," says Kennedy. And there is a good deal of sound reasoning in such doctrine. Mr. Kennedy has recently visited some of the big Short-horn sales and bought cows for four figures. Price doesn't stump him at all if he can get what he wants.

But, to wind up on the subject of the tractor, we have it as Mr. Kennedy's direct statement that Wisconsin farmers with 160 acres or more can ill afford to pass by the tractor without giving it very careful consideration. "As for me," says Mr. Kennedy, "you couldn't get my tractor away from me for five times what it cost if I couldn't get another one."

Questions and Answers.

Size of Dirigible Balloon.

How many feet in circumference would a dirigible have to be to lift 800 pounds? Would a model gas engine with a one-inch bore work on the Diesel principle?

Answer.—The circumference would depend upon the shape of the balloon. It is volume that counts. In figuring the volume of the balloon you can count on every cubic foot of volume lifting about .07 of a pound if the balloon is filled with hydrogen gas. If properly designed, the model engine with a one-inch bore should work.

Material For Magnets.

How can I temper iron so that it will hold magnetism? Please publish a diagram showing how magnetos are made.

Answer.—Common iron cannot be tempered so as to hold its magnetism. Tool steel can be tempered to hold magnetism by heating it to a cherry red heat and plunging it in water. There is a special grade of steel, known as magnet steel, that makes better magnets than tool steel.

If you are interested in the construction of magnetos, write to some of the magneto manufacturers for their literature describing the construction of their magnetos.

Magneto Out of Order.

I have an Overland car, Model 83. It is equipped with a Dixie magneto. My magneto troubles me quite a little; therefore, I would like to know how to arrange the ignition so as to use dry cells on my Willard storage battery.

Answer.—If your car is not already equipped to use the storage battery for ignition, it would be considerable expense and trouble to make the change. It would be better for you to take your car to the nearest Overland service station and have it put in order. If it is the magneto alone that is causing trouble, write to the Sumter Electric Co., of Chicago, and they will direct you to the nearest repair station for their magnetos.

Engine Runs Irregularly.

I have a 1914 twin Yale motorcycle that works only on one cylinder when running on low speed. Then it will back fire through the carburetor and speed up for a while, and then gradually slow down again. It has good compression and tight valves. Can you give me the cause of the trouble?

Answer.—An air leak at the point where the intake manifold is attached to the cylinder that misses is the most probable cause of the trouble. Other possible causes are: Dirty spark plugs, due to too much oil; improper gas mixture; a weak exhaust valve spring on the cylinder that is giving the trouble; too great a clearance between valve stem and push rod; an improperly adjusted vibrator point, or too much spark advance.

Lights Burn Out.

I have a Ford 1917 Model touring car. I am having trouble with the light bulbs burning out all the time. I have used bulbs of six volt, twenty-one candle power; nine volt, twenty-one candle power; nine volt, eighteen candle power, and nine volt, fifteen candle power, but it makes no difference. Has a Ford magneto a resistance? Could I use an eighteen to twenty-four-volt, forty-candle-power bulb, no tail light being used? Does it take more current for a twenty-four-volt bulb than for a nine-volt bulb, or is the voltage only for distance and heat? Which bulb is recommended as using the least current; the vacuum or the nitrogen filled bulb? Will it injure the Ford magneto to use a forty-candle-power bulb? A certain company has a device called "Evenlite" to regulate the current for low and high speeds. Is it O. K.? Has it a hand adjuster for regulating the light to suit the driver?

Answer.—The lights burn out because the voltage of the bulbs is too low to stand the speed you are running. If a nine-volt bulb burns out, use a ten-volt or twelve-volt bulb. Too great a candle power may injure the magneto. You should not use over two bulbs of fifteen candle power each. The forty candle-power bulb might overload the magneto. The magneto has no resistance coil; the bulbs themselves are the resistance; the higher the rated voltage the higher the resistance of the bulb. It takes less current for a twenty-four-volt bulb than for a nine-volt bulb if the candle power is the same. The power required to operate the bulb would be slightly more for the twenty-four-volt bulb. The nitrogen-filled bulb is more economical in use of current than the vacuum bulb. We are not familiar with the regulating device you mention.

Making a Tractor.

I would like to know if I could use a twelve-horse-power Fairbanks-Morse, two-cycle, two cylinder motor for a tractor? By using a clutch, could I use two bull gears for drivers with chain drive? Would it pay, or would it use too much oil? What would it pull? The flywheel turns about 800 R. P. M.

Answer.—We would not advise you to attempt to make a tractor unless you have all the materials at hand, or at least know where you can get them and what it will cost. You should also have a good supply of tools. Your engine if installed in a suitable machine should pull one fourteen-inch plow. It might pull two twelve-inch plows. You could use the two bull wheels and chain drive successfully. The cost of the fuel should not be excessive.

Wiring Lights For Alternate Use.

We are wiring our house for electric lights. We would like to have two lights in some rooms, a reading light and another light, arranged so that when one is turned on the other is turned off automatically. Is this possible?

FIGURE 1.

Answer.—It is possible. All that is necessary is a three-point switch, connected as shown in Figure 1.

Wisconsin State Fair.

The premium book of the Wisconsin State Fair has been sent out and is perhaps the most attractive book issued by any state fair this year. A total of 20,000 copies have been sent to prospective exhibitors and others.

A total of $46,116.87 is offered for premiums in various departments, an increase of $5,044.75 over 1916. The liberal offerings have prompted breeders' associations and individuals to offer cash prizes in the sum of $3,612. Various associations and individuals offer medals and trophies conservatively valued at $1,000, making a total of $50,728.87 offered to exhibitors this year.

In the horse department premiums for the draft horse classes have been materially increased. The successful futurity classes for Percherons and Clydesdales of former years will be continued and additional money is offered in these classes. The division for light horses has been entirely revised and made up to date, so that the Wisconsin State Fair will have a high-class horse show each day of the fair. A class for Shetland ponies has been added and entries for this class will be limited to horses bred and owned in Wisconsin.

In the cattle department, in addition to increasing premiums for both beef and milk cows, the state fair has added classes for dairy Short-horns and will also continue the cow-testing association demonstration, which was a feature of the 1916 fair. Cows making the largest yearly records of butter fat will be on exhibition and arrangements will be made for informal discussions and demonstrations of interest to all dairymen. Liberal special prizes are offered in this department by breeders' associations.

In order to stimulate breeding of sheep, especially in Wisconsin, the state fair has added liberal premiums for animals bred and owned in Wisconsin. The liberal classifications of former years in open classes will be continued. This department has a new building, added in 1916.

In the swine department premiums for Berkshires, Chester Whites and Duroc Jerseys have been increased and futurities for Poland Chinas and Duroc Jerseys will be continued. In addition to liberal increases in premiums, the state fair also offers prizes for Spotted Poland Chinas. This department has a new building added in 1916.

In order to have a high-class poultry display the poultry department has been completely revised, several additional classes have been added and special prizes will be offered for displays of the principal varieties. The excellent pigeon displays of former years will be continued. This department will show in a new $25,000 building equipped at a cost of $3,000.

The departments of county exhibits and agriculture have been combined and an effort will be made to have every county of the state make an exhibit. Premiums will be offered for corn of the 1917 crop and also for the 1916 crop. Liberal premiums will be offered for principal varieties of potatoes.

In the horticultural department a new class has been added for cranberry exhibits and the state horticultural society also offers premiums for exhibits by Wisconsin nurserymen.

In the dairy department, in addition to prizes for the common varieties of cheese made in Wisconsin, prizes will be offered for several of the fancy brands of cheese that are becoming more and more popular.

In the boys' and girls' department attractive special premiums are offered by breeders' associations and also by Frederick C. Underwood, president of the Erie Railroad, and by the Merchants' and Manufacturers' Association of Milwaukee.

The woman's work department has been revised and will this year particularly appeal to the farm woman of Wisconsin.

Hampshire Breeders Meet.

To the Editor:—The officers and directors of the Wisconsin Hampshire Breeders' Association held a meeting June 29th at the Hotel Ewing in the city of Fond du Lac. There were present H. A. Bush, president; A. L. Damon, vice president; E. E. Cowles and T. C. Wilsie, directors; W. W. Meacham, secretary and treasurer. It was decided to hold a meeting of the state association either the last week of October or the first week in November, at which time arrangements may be made to hold an auction sale of Hampshires at Madison. It was also decided to place a Hampshire gilt at the university farm. The meeting was enthusiastic and we hope for good results therefrom.

W. W. Meacham, Sec.

$15-$20 A Day Baling Hay
COUPLED UP SHORT

CURRENT EVENTS

GOADED into action by the extortionate prices being charged for some of the staple articles of food and raiment (without much, if any, regard to the price paid the producer) President Wilson last week appealed to the nation's business interests to put aside every selfish consideration and to give their aid to the nation as freely as those who go out to offer their lives in the battlefield. In a statement addressed to the coal operators and manufacturers he gave assurances that just prices will be paid by the government and the public during the war, but warned that no attempt to extort unusual profits will be tolerated. "Your patriotism," said the president's appeal, "is of the same self-denying stuff as the patriotism of the men killed and maimed on the fields of France, or it is no patriotism at all. Let us never speak, then, of profits and patriotism in the same sentence. I shall expect every man who is not a slacker to be at my side throughout this great enterprise. In it no man can win honor who thinks of himself." In unmeasured terms, however, President Wilson condemned the shipowners of the country for maintaining a schedule of ocean freight rates which has placed "almost insuperable obstacles" in the path of the government. "The fact is," he asserted, "that those who have fixed war freight rates have taken the most effective means in their power to defeat the armies engaged against Germany."

THE fortunes of war fluctuated badly last week. The Germans, by a vigorous effort, succeeded in pushing back the British line in Belgium for some good ground and men gains. At the same time, the Russians continued to beat the Germans and Austrians back in Galicia, taking many prisoners and seriously threatening the city of Lemberg. The Russians are pushing ahead on a 100-mile front and seem to be a factor once more in the allies' operations against the Teutons. The English succeeded in bombing a German-Turkish vessel and some important war buildings in Constantinople. The American ship, Kansan, loaded with a cargo of flour and other foodstuffs and with steel, was sunk off the coast of France, with a monetary loss of about $6,000,000 and some loss of life, the extent of which has not been officially announced. General Pershing has selected the portion of the allies' line which the United States troops will be moved to, and attempt to hold against the Germans, within a few weeks, after they have been accustomed to the new trench warfare and living. There were renewed indications that Germany and Austria, either singly or together, might be willing to discuss peace terms, but the only terms which Germany has shown any evidence of accepting are so one-sided and unreasonable as to make an early peace out of the question.

THE most daring and the largest air raid which the Germans have yet made on London and other English cities occurred last week and resulted in the loss of a score of lives, with several other score injured. The destruction of property was larger than ever. So frequent and so heartless have these air raids become that the English are demanding that reprisals be made upon German towns. There has been much discussion since this last raid of the apparent lack of necessary defenses of the English against such attacks from the air. The Germans are using airplanes instead of Zeppelins nowadays. In this last raid over a score of airplanes made the trip, flying in close formation. The English succeeded in shooting down ten of the German airplanes, with attendant loss of life among the navigators, but the damage done by the raiders was much greater than that done by the defenders. Thus far the English military authorities have positively refused to make raids on German towns in reprisal, contending that they are not warring on women and children, the main sufferers from these air attacks.

THE last step necessary to make the national guard of all the states available for duty in France was taken by President Wilson last week, with the issuance of a proclamation drafting the state troops into the army of the United States on August 5th. It is expected that the national guard will follow the regular army into service in France and will, in turn, be followed by the conscript army, which takes up its work of training at the various cantonments September 1st, or soon thereafter. Fourteen camp sites for the sixteen tactical divisions into which the guard will be organized have been selected and the militia bureau is preparing the railway routing of the troops to the camps. Seven of the sites selected are in the southeastern department, five in the southern and two in the western. The two others will be in the southeastern department and until they are approved assignment of regiments to camps and divisions cannot be fully worked out. The state troops are called into service as follows: On July 15th, New York, Pennsylvania, Ohio, West Virginia, Michigan, Wisconsin, Minnesota, Iowa, North Dakota, South Dakota and Nebraska. On July 25th, Maine, New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, New Jersey, Delaware, Maryland, District of Columbia, Virginia, North Carolina, South Carolina, Tennessee, Illinois, Montana, Wyoming, Idaho, Washington and Oregon. On August 5th, Indiana, Kentucky, Georgia, Florida, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, Texas, Missouri, Kansas, Colorado, New Mexico, Arizona, Utah and California.

GOVERNMENT control of American exports, authorized in a provision of the espionage act, was ordered put into operation July 15th by President Wilson with the issuance of a proclamation requiring the licensing of shipments to all countries of the most important export commodities. In a statement accompanying the proclamation the president declared the government's policy will be first, to give consideration to American needs; next, to meet as far as possible the requirements of the allies, and lastly to supply the neutral countries wherever practicable. It is made clear that every effort will be made to see that no supplies reach Germany, Austria and Turkey. The commodities named in the list put under control are coal, coke, fuel, oils, kerosene and gasoline, including bunkers; food grains, flour and meal, fodder and feeds, meats and fats; pig iron, steel billets, ship plates and structural shapes, scrap iron and scrap steel; ferro manganese, fertilizers, arms, ammunition and explosives. The inclusion of foodstuffs in the proclamation lends color to statements that the administration is considering the advisability of a complete embargo for sixty days on all food shipments to give the country time to ascertain the amount of its supplies and to give allied and neutral countries an opportunity to present a full program of their requirements.

DIRECTORS of the Chicago Board of Trade last week fixed a maximum price of $1.28 for the December and May (1918) deliveries of corn. No action was taken as to September corn. According to an official of the board the establishment of a new maximum price for the December delivery and for all later options was needed to bring trading conditions into harmony with the government's war policy of preventing undue speculation and unwarranted high cost to consumers. Generally the options of the new 1917 crop were dealt with in last week's action. A maximum price of $1.65 for the September delivery in Chicago and for all other old crop futures already in effect, was not disturbed, as the value of old corn for immediate delivery was now much in excess of that limit and had that day touched the highest figures ever known for Chicago, $1.91¾ a bushel for ordinary [illegible]

REPORTS that the food administration will buy at a price of less than $2 a bushel to the grower for the 1917 American wheat crop drew from Herbert Hoover this denial: "It is not the intention of the food administration to fix the price for wheat, nor is it expected that it will have any such powers. If the food bill passes congress, however, we certainly will not stand for speculative buying. The farmer will be protected, it was further asserted by Mr. Hoover, against centralized buying by the allies. Mr. Hoover and his associates are anxious to feel that the export price should be maintained at a figure that will be an inducement to farmers to continue production.

Soy-bean meal, like cottonseed meal, has a high fertilizing value. Feeding the meal to stock and applying the manure to the soil is the most economical way to use it.

Don't *Guess* at Your Battery's Condition, *Know*

Knowledge is easy. Just see that the battery is filled *regularly* with *pure distilled* water; and test it regularly with a Willard Hydrometer.

Our little free book "Are You Starving Your Battery" tells exactly how and when to do both.

Result, you won't be in danger of having your car stall, your starter fail or your lights go out.

But even good care won't save a poor battery—you need a good one to begin with—and what could be safer than to buy the one which has been adopted as standard by the engineers of over 150 car builders and is used in 1,000,000 cars?

When you write to the Willard Storage Battery Company, Cleveland, Ohio, for the booklet, H-7, "Are You Starving Your Battery," ask for the list of 950 Willard Service Stations.

Meanwhile ask your dealer about the expert battery service I'm equipped to give you.

The Willard Service Station Man

Evidence Favors the Tractor.

Badger Farmers Have Had Considerable Experience With Tractors and They Are Well Satisfied.

THE WISCONSIN FARMER has been able to gather some practical ideas from Wisconsin farmers who have had tractor experience. These indicate the adaptability of the tractor to the farm conditions of this state. To be sure, the tractor works to better advantage in some soils, especially those free from stones and stumps. The tractor will save horseflesh even on the rough farms as well as on the bes and, but some allowance must be made for poor conditions.

HORSE FLESH CAN BE SAVED WHEN THE TRACTOR HANDLES THE MOWER.

T. O. Mandt, a few miles out of Madison, has a farm of 173 acres which has never been cleared of the stone. The chances are it will be in the very near future, however, for Mr. Mandt purchased a 15-30 tractor last fall and proceeded to plow up one of the worst fields on his place. For more than half a century plows drawn by horses have picked their way in and out among the many boulders. The tractor was shown no consideration, however, and the four bottoms that followed it stubbed their points so often and broke the wooden peg so frequently that Mr. Mandt became convinced a tractor was not receiving fair treatment under these conditions. However, he plowed thirty acres and resolved that this year a start would be made to clean the field of the big stones. And he intends to use the tractor in doing so. He has found that a log chain snaked around a big boulder and attached to the tractor will move a stone of considerable size to any place the tractor is headed for. Each stone will, during the next plowing, be marked and treated in the same way and the field gradually cleaned up. "I do not know whether I can say that I saved so very much time, but I do know that I saved a lot of horseflesh by using that tractor," said Mr. Mandt. "I will save some more when it comes to getting the big stone out for that tractor will walk away with anything I can loosen enough to get a chain around. It has helped me to the extent that I can get rid of two horses, which leaves only six for the farm work, and I expect I will be able to cut down this number when I have learned more about my machine." During the summer the tractor is being used for road work.

Down at Sharon, Wis., the American Milk Company, following the appeal of President Wilson to the farmers for a greater effort for crop production, offered their patrons and others around Sharon and Darien to plow for the maximum of $1.50 per acre all such land as they thought they could not handle, owing to a shortage of labor and machinery. About fifty farmers signified their intention of making use of this offer and the milk company purchased three tractors to do the work. Some of the farmers had ten acres and some more, but all of it was land which it was impossible for them to get under the plow this spring. The company estimates that from 500 to 600 acres were put into crops through their offer, which would not have raised much else but pasture grass this season. The shifts on these tractors worked from 4:30 a. m. to 8:30 p. m. every day for about five weeks. Much of the land was rough, some of it stony and all of it exceedi gly tough plowing. Nevertheless the tractors averaged from six to seven acres for the time they were working. Sometimes three bottoms would turn as high as ten acres and over and some days only half that much. Four local boys and two University students from Professor White's agricultural engineering classes managed the tractors. The two university students held their own with the experienced men, though they had never run a tractor other than the work in the school required. The emphasis Professor White places upon a thorough study of each machine in the classroom and laboratory proved its value right here. The American Milk Company has done a good work in offering this service to the farmers around Sharon and Darien and they showed that there was no other motive but service that prompted this offer. There are no obligations for the farmers to meet except the $1.50 fee per acre plowed. They can plant what they wish, sell where they wish, or feed it to dairy or beef cattle.

USE THE TRACTOR IN HARVEST TIME AS WELL AS FOR PREPARING THE SEED BED.

O. A. Lukken & Sons, Hartwig and Albert, are farming some 300 acres near Mt. Horeb. Seven or eight horses are on the farm to furnish the power. A year ago they decided to buy a small type tractor. The first thing they did was to give the horses a vacation and hitched the tractor to the binder instead. Last season was undoubtedly one of the hottest in the history of the state. The Lukkens had thirty-five acres of oats to cut, dead ripe, but it was too warm for horse labor. The tractor worked that day and the next and the next. Many of the neighbors began in spite of the heat, but had to unhitch during the day and wait for the cooler hours or until the next day. "It was even too hot to shock," said Hartwig, "but it wasn't too hot to sit on the seat and run the binder. We think that our tractor saved our horses during those days. We didn't dispose of any, as we raise a few colts each year, but we will undoubtedly do so as we get squared around and get the machinery for field work for the tractor."

Wm. Thompson, also of Mt. Horeb, got a small-sized tractor about a year ago and, though he originally bought it for silo filling for his own farm and for work around the neighborhood, he has also used it for plowing, pulverizing and harrowing. "I did not get a steering attachment with my tractor when I bought it and I find that it is not easy to plow without one. I have cussed the tractor at times, but now that I know all about it I believe it is all right. It can do the work with a saving of horses wherever it is used right." It takes about $2 worth of kerosene and lubricating oil for a ten-hour day to plow with two bottoms, and Mr. Thompson says he can average better than four acres a day.

PREPARE FOR SHORTAGE OF FARM LABOR

A big shortage of farm labor this fall is inevitable. Be prepared. Bring in a recruit that needs no training—one that won't be drafted. Prepare to harvest your potato crop with a

Hoover Potato Digger

It is crop protection

Not only does a Hoover Digger help to solve the farm labor shortage but it harvests your crop at less cost. One man with a Hoover Digger and horses will dig as many potatoes as any ten men can dig by hand.

The Hoover gets them all out of the ground—no waste. Stalks and weeds are delivered to one side. The Hoover Digger can be furnished with a picker attachment which delivers the potatoes in piles or in crates.

Hoover Diggers are built to last. Built almost entirely of steel and malleable castings. Elevator rods are offset. Potatoes do not roll back. This construction promotes separation. Dust-proof roller bearings are used in all important bearing points. Big drive wheels are used.

Write for booklet covering the full line of Hoover Potato Diggers. Ask for package P—64

MOLINE, ILL.

AGAIN THE TRACTOR IS USEFUL IN PULLING LOADS WHICH A TEAM COULD NOT BUDGE.

UP THE HILLSIDES WITH A STEADY, RELIABLE CHUG-CHUG WHICH PLEASES THE FARMER.

with it. Sometimes it will plow more and sometimes less. A tractor cannot be used in all kinds of rough land, and it is only fair to have fields and farms so arranged that the greatest efficiency is possible. Mr. Thompson hitches pulverizer and harrow to the tractor at the same time with especially good results.

Swartz Bros., of Waukesha, have used a two-wheel tractor during the last year for 100 days of ten hours each. They plow and prepare their fields with the tractor, harvest their grain, bale alfalfa, thresh and fill silos with it. "We have our farm in such shape now and our work so arranged that we can make use of the tractor during all times of the year with a greater saving of time and effort than was possible with horse labor alone," said Peter C. Swartz, one of the brothers. "We have cut down our horse labor from twelve to eight and we have arranged our fields so that we have fairly good-sized tracts to work on." The boys are more than satisfied with their tractor; they are enthusiastic. On their 500-acre farm it is especially important that they get the work done quickly and at the time when weather conditions are favorable. According to their statements the tractor has made this possible in a greater degree than horsepower ever could.

Matt Michels, of Peebles, in Fond du Lac county, got a tractor last year and has used it for fall and spring plowing. There are a few hills on his place that have always proved hard plowing for the horses. The tractor chugs up those hills just as steady as on even ground. It was a saving of horseflesh and time there also that played an important part in the decision to purchase a tractor. Besides plowing other uses for the tractor will be found and the back-breaking work taken away from the animals as fast as the conditions can be made right. The two Michels boys on the father's farm have the mechanism of the tractor down to the last letter and can get every bit of power from the fuel that it is possible to get.

Barnett County Federation Meeting.

To the Editor:—What proved to be the greatest event that has ever taken place within the boundaries of Burnett county, Wisconsin, was the first annual picnic given by the Federation of Farmers' Clubs of Burnett county, on June 3d. The day was ideal—not too warm, yet just a good picnic day when a person feels comfortable with his coat on. The picnic grounds were seven miles southeast of Grantsburg on the shore of Wood Lake, one of the many beautiful lakes in Burnett county.

The Alpha-Midway Farmers' Club prepared a float out of a hay rack. This was used by the Grantsburg Band, which provided the music for the day. The speaking was advertised for the afternoon, but at 11 a. m. fully 1,000 people were on the grounds. At 1 p. m. it was estimated that at least 1,700 people were there ready to listen to the program and take part in the various events. As the principle drawing card, the club chipped in and bought a high-grade Holstein calf to give to the person guessing nearest to its correct weight. Fully 800 people guessed at this calf's weight. Of this number four guessed within half a pound of the correct weight. These four drew lots and the calf was won by Walter Curry, a sixteen-year-old farmer belonging to the Ekdall Farmers' Club.

The program committee also arranged to have a boat race between farmers' clubs, another open to men and one open to women. In the farmers' club boat race Midway-Alpha won first place, Wood River second and Randall third. The girls' boat race was very exciting, six young ladies taking part in this race.

Quite a neat little sum was realized from the sale of ice cream and lemonade, which is to be used in some way whereby the public will derive the benefit. It may be that a "Farmers' Club Rest Room" will be built at the fair grounds.

Mr. Packer, immigration commissioner, and D. E. Willard, development agent of the Northern Pacific Railroad, were the speakers of the day. Everyone was so inspired by the many good things that they heard that they went home thinking Burnett county about the best place to live in America. Farmers' clubs are already making plans for a bigger and better picnic next year.

Prof. R. A. Moore was in Burnett county June 26th and organized the Burnett County Order of the Wisconsin Agricultural Experiment Association. Twenty-two members joined the association and all joined with the determination to make the order one of the good ones such as we find in Wisconsin. Burnett county raises thousands of acres of pedigree rye at the present time and we are in hopes of pushing the pure seed propaganda to such an extent that nothing but the very best will be found in Burnett county.

George Briggs,
Grantsburg, Wisconsin.

Big Holstein Breeders' Picnic.

To the Editor:—The Mount Horeb Holstein Breeders' Association met in their second annual summer picnic at Sec. J. E. Stolen's farm June 29th. The day was ideal for such an event and there were 250 automobiles parked about the farm, besides a number of buggies. Altogether there were about 2,000 people present. Music was furnished by the Mount Horeb band and there were good speakers both in the afternoon and evening. The president of the association, Mr. Ruste, welcomed the picnickers in his usual good-humored way. The boys who were present were very much interested in a judging contest on yearling heifers. Mr. Moore, from North Dakota, gave us a good address on the formation, and the object and aims of the Farmers' Nonpartisan League. This speech took very well with the large audience. At the basket dinner the secretary furnished hot coffee and the association free ice cream and buttermilk. An address was given in the afternoon by Mr. Freis, of Richland Center. He discussed handling the Holstein breed of dairy cows to secure the best results. Mr. Freis also judged a number of young bulls for the benefit of the interested members. It is evident that farmers in our vicinity are keenly interested in the Holstein cow and the members of our association certainly think this is the best dairy cow. We have now 100 members in good standing and we expect soon to see western Dane county one of the best Holstein cattle centers in this country.

J. E. Stolen, Sec.

Jersey Breeders Meet.

To the Editor:—Shawano and Marathon counties' Jersey breeders picnic, held at Elm Grove Farm on July 4th, was very well attended, there being about 300 present. F. F. Showers, president of the Wisconsin Jersey Breeders' Association, gave a most interesting and instructive talk on patriotism and matters pertaining to the farm and the Jersey cow in particular. Mr. Merton Moore and Mr. R. A. Humphrey, field agents of Shawano and Marathon counties, were present. Each gave instructive talks as to their duties and ways in which they may assist the farmer. These men spent the time in becoming acquainted with the people and giving them information. Nearly all us farmers have some knotty little problem that we like to hand to someone for solution. Mr. Showers gave a cow demonstration. Marie Peterson won first prize in the cow-judging contest. Laurin Klovdahl was so close a second that it was decided to give them equal money. Mr. Showers, Mr. Moore and Mr. Humphrey were the awarding committee.

A. J. Peterson, Sec.

An Agricultural Celebration

To the Editor:—Over 8,000 people turned out to the agricultural Fourth of July celebration held at Monroe this year. E. S. Bullock, of the Wisconsin Live Stock Breeders' Association, gave an excellent address on "Winter Dairying and Dollars."

L. F. Graber,
Emergency Food Agent.

Waterloo Boy
Kerosene Tractor
The Greatest Fuel Economizer

See Us at Fremont, Neb., Tractor Demonstration August 6 to 10

Your money can't buy greater tractor value anywhere, than is built into every part of the Waterloo Boy. This tractor represents a practical, high ideal expressed in steel and iron through the highest mechanical skill.

When you consider that a few days' layup for repairs at a critical time, may cost you many hundreds of dollars, you can appreciate a tractor built like the Waterloo Boy.

A Miser In Fuel—A Giant In Power

The Waterloo Boy has set the pace for all tractors in fuel economy. It was the first tractor built especially to operate on kerosene. Our patented kerosene manifold makes kerosene a more powerful fuel than gasoline.

Complete standardization of parts means that the Waterloo Boy is a perfected machine—tested to the limit and proven true to the standard set for Waterloo Boy machines in 22 years' manufacturing success.

Write for full information on this tractor. Our finely illustrated catalog shows it in detail, gives field views and letters that will interest you. Sent free on request.

WATERLOO GASOLINE ENGINE COMPANY
3508 West 3rd Ave. Waterloo, Iowa

Our many distributors insures prompt delivery and helpful service when needed.

Waterloo Boy Tractor doing a 10-horse job of sod breaking for Jas. S. Grubb, at Noremac, Sask., at a fuel cost of less than 10 cents an acre.

Waterloo Boy Tractor pulling 4-disc plow 7 inches deep in Texas black wax and dragging 3-foot harrow, on farm of Col. Samuels, near Dallas, Texas.

THE HOME

Letters intended for publication should be accompanied by the name and address of the writer, not necessarily for publication, but as a matter of good faith. All communications intended for this department should be addressed to Editor Home Dept., Wisconsin Farmer, Madison, Wis.

Arrange the Kitchen to Save Steps.

A well-planned kitchen saves time, and every woman, and particularly the farm woman, is forever and always on the lookout for ways and means of saving time and steps. She needs the extra time that a convenient kitchen will give her. She needs it for rest and recreation quite as much as for the performance of the countless other home and social duties that fall to her lot. A woman worn by much trudging in a mammoth, badly arranged kitchen, wearied by endless carrying of fuel and water, and fatigued by poor light and ventilation cannot expect to do her duty. She may wear herself out in the service of her family, but her duty—giving her best to her family—will not have been performed, because her "best" will have been expended in the hours of toil, and she will be too tired and worn to enjoy the family companionship which makes life worth living.

Think of the saving in steps and strength by even so simple a thing as a wood box beside the kitchen range, instead of running to the outdoor supply each time the fire is replenished. Women who have made their kitchens a convenient workshop may think it isn't possible that any kitchen is unprovided with a near-at-hand fuel supply, but, unfortunately, such is the case. And then, just to go a bit further these hot days, there should be an oil or gasoline stove, and, further yet, a fireless cooker, to eliminate the heat of much necessary baking and brewing. Work in a cool kitchen is far different from work in a hot one.

A drain board on one or both sides of the sink is a great help. Here vegetables can be prepared or dishes washed without once having to cross the room. Drawers may be built beneath the sink or a cabinet arranged above to hold soap, scouring powder, brushes, towels, etc. The sink should have rounded corners, because such will not catch the dirt and are easy to keep clean.

There are not two housewives in a dozen who would arrange their cupboards alike, but all will agree that they should be roomy, convenient to both stove and sink, and of a height to suit the worker. All working utensils should be kept near the place where they are most used. Built-in cupboards above and below a work shelf or a kitchen cabinet (and the present-day cabinets are wonders in the completeness of their equipment) serve this very need by having handy pots and pans as well as provisions.

Of course, the size of the kitchen depends upon its uses. A small kitchen, well lighted and well ventilated, is much to be desired if it is possible to have it. But even when it is necessary to use a large kitchen the equipment may be concentrated at one side so that there need not be useless tramping over a great space.

If the housewife will only look after these and numerous other small items in her kitchen she will be surprised at the time and energy saved.

Corn and Cheese.

Specialists of the United States Department of Agriculture point out that corn may be used with cheese in place of macaroni for the preparation of a delicious and nutritive combination dish. The following recipe has been worked out:

1 cup samp (coarsely ground or cracked corn).
1 quart of water.
1½ teaspoons salt.

Boil the samp in the salted water until tender. Drain and combine with the following sauce:

1 cup skim milk.
1 cup finely cut cheese.
2 tablespoons flour.
1 teaspoon salt.
¼ teaspoon mustard, paprika, or other seasoning.

Mix the seasonings with the dry flour. Add enough milk to form into a smooth paste. Add the remainder of the milk and heat in a stewpan, stirring constantly until thick. Add the cheese and stir until it is thoroughly melted.

Put a layer of the boiled samp in a baking dish or casserole. Add a layer of sauce, and so on alternately until the material is all used. Sprinkle bread crumbs over the top layer of sauce and cook in a medium oven until the crumbs brown.

Lye hominy or hulled corn (to give it both its southern and its northern name) may be used in place of coarse cracked corn in the preparation of this dish. If this product is used, it is unnecessary to heat it until it is placed in the oven. A richer sauce may be made, if desired, as follows:

Melt two level tablespoonfuls of butter in a saucepan. Mix into it the flour and seasonings. Add the milk and heat, stirring constantly until the sauce becomes thick and smooth. Add the cheese and stir until it is melted.

Fruit Juices for Jelly Making Kept Without Sugar.

Fruit juices for use later in jelly making can be sterilized and bottled without sugar and made into jellies at the housewife's convenience. This enables her to do with fewer jelly glasses and to distribute her purchases of sugar for jelly making through the year. Moreover, with the bottled juice she can make a greater variety of jellies, as juices which will not jell can be put up when the fruit is ripe and combined later with fruits that will jell, or fruits ripening at different seasons can be combined. For example, the juice of strawberries, cherries or pineapple can be kept without sugar and later when apples are plentiful can be made into combination jelly.

From the unsugared sterilized juices of currants, apples, crabapples and grapes, kept from nine to eighteen months, the bureau of chemistry, United States Department of Agriculture, recently made jellies of excellent texture, flavor and color.

To put up unsugared fruit juices for jelly making, proceed exactly as if jelly were to be made at the time. Cook the fruits until they are soft and strain out the juice through a flannel bag. Heat and pour while hot into bottles previously scalded. Fill the bottles full, leaving no air space between juice and cork or seal. Place the filled sealed bottles on their sides in water near the boiling point, and keep them in the bath for about thirty minutes. Make sure that the corked or sealed end is under the hot water. As soon as the bottles are cool, cover the cork with a paraffin seal. Thorough sterilization and sealing are absolutely essential to success.

To make jelly from the sterilized juice, test its jelling quality, add the proper amount of sugar and proceed as in making jelly from freshly expressed juice.

An ideal arrangement of stove, work table and sink. The windows above the work table afford plenty of light, and the ample cupboard and storage space near at hand are features that appeal to every housewife.

Cream Cheese.

To the Editor:—I noticed in a recent issue that Mrs. L. R. wanted a recipe for cream cheese. I have a recipe that I got from your paper a year ago and I have had such good success with it that I am sure Mrs. L. R. will like it.

Five pounds of milk will, as a rule, make one pound of cheese. Use the milk that is drawn from the cows at the evening milking, keeping it cool overnight, as the less the cream is permitted to rise the better. In the morning warm this milk to a temperature of 85 degrees and then add the morning's milk. After thoroughly aerating by stirring and pouring, thus allowing all animal odor to escape, pour all the milk into a large boiler.

If it is desired to color the cheese, put in about one teaspoonful of cheese coloring to twenty gallons of milk, then add one-half ounce of rennet extract to twelve gallons of milk, or, if rennet tablets are used, one tablet about the size of a cent will be sufficient for eight gallons of milk. Dissolve the tablet in a little warm water before adding it to the milk. Use enough rennet to start the milk to curdle in about fifteen minutes. The milk should be at a temperature of about 85 degrees when the rennet is added, and it is a good plan to have the temperature slowly rising while the rennet is working, but it should not go above 88 degrees.

The cheese is ready to cut when it will break smooth and clean cut for a short distance ahead of the fingers. If a regular cheese knife is not at hand, use a clean corn knife and cut both ways, making the cuts about one-eighth of an inch apart. Stir the curd very gently for four or five minutes, then start up the fire and increase the temperature to about 96 degrees during the next fifteen minutes. It is necessary to watch the milk closely during the heating process, and a small thermometer which can be bought for a few cents should be used.

To tell when the whey is ready to draw off, press the curd between the hands, and if it spreads apart when the pressure is removed it is then ready to be drawn off. Add four and one-half ounces of salt to the cheese curd obtained from 100 pounds of milk.

The mass is now ready to be pressed. If there are no cheese hoops available, a strong pail will answer the purpose, first lining it well with cheesecloth and then filling to the brim with curd. Now place a cloth over the top of the pail to cover the curd. On this place a strong follower that will fit tight in the pail, and apply pressure by placing a block on the follower and over this a pole about ten feet long fastened at one end. Place the cheese two or three feet from the end that is fastened and at the outer end place about twenty-five pounds of weight to make sufficient pressure. Let this stand for three or four hours, then double the weight at the outer end and let stand for about twenty-four hours. The cheese is then taken from the press and rubbed for fifteen minutes with good, fresh butter. Then sew bandage around it to keep it from flattening out. Keep the bandage clean and smooth and rub it with butter until it is thoroughly saturated. Put the cheese in a dry, airy place to cure. Rub every day with butter, turning each time. The rubbing prevents the cheese from molding and the turning causes it to cure evenly.

Mrs. Harker.

Pickled Beets.

To the Editor:—I have just read an article on canning vegetables for winter use and I will give my method of putting up beets. I cook the beets until tender, then lift them out into cold water. Let them stand a few minutes, when the skin will slip off easily.

While the beets are cooking I prepare the vinegar by putting in salt, pepper and sugar to taste, and have it boiling hot by the time the beets are ready. Drop the beets in the prepared vinegar and let them boil until all are thoroughly heated through, then back in glass cans and pour the sirup over them and seal tight. I always use about one teacupful of sugar to a gallon, as we like them sweet. In this way they are ready for the table at any time. Mrs. L. Stubblefield.

Not Always Happy.

It is customary, but I think it is a mistake, to speak of "happy" childhood. Children are often overanxious and acutely sensitive. Man ought to be man and master of his fate; but children are at the mercy of those around them. Mr. Rarey, the great horse-tamer, has told us that he has known an angry word to raise the pulse of a horse ten beats a minute. Think, then, how it must affect a child!—Lord Avebury.

If lemons are dried and do not seem to contain much juice just pour boiling water over them and let them stand until the water is cold. You will be surprised at the amount of juice they contain, and the juice is not weakened by the water.—[Mrs. W.

THE YOUNG FOLKS

Squirrel Finds a New Home.

Dear Young Folks:—I enjoy reading the Young Folks' page very much, but have never written before. I live on a 217-acre farm half a mile from a small town. I am ten years old and am in the sixth grade. I have a brother five years old who will start to school next year, and two sisters going to high school.

I have a garden of my own. I planted radishes, beans, peas, turnips, squashes, and also some flowers.

I will tell you about my pet squirrel. One morning while I was outdoors feeding my kittens the chickens made a queer noise and upon looking up I saw a small, fluffy ball bounding toward the door. Mama, wondering what the chickens were making such a noise about, opened the door, and in jumped a little squirrel. It seemed to think that this was its home and has been

here ever since. It will eat food from my hand, and it doesn't seem to be afraid of anything. It is a comical sight to watch it wash its face and wipe it with its fluffy tail. Mabel.

Wants to Help Vesta.

Dear Young Folks:—I enjoy reading your letters very much. I am a little girl twelve years old. I live on a farm five and one-half miles from town. I have my father and mother and one sister and I am very sorry for Vesta. I read her letter and would like to tell her what she wanted to know. I asked my mother about it and she said the dress should be worn about four inches below the knees after the hem is turned up. And she also said it would be all right for her to go to parties with her brother. Aneta.

A Cookie Recipe.

Dear Young Folks:—I have never written to you before and I am going to tell how to make sour milk cookies. I am twelve years old.

Mix one-half cupful of butter with two cupfuls of sugar, two eggs, one cupful of sour milk, one teaspoonful of soda in the sour milk, two cupfuls of flour. Add enough more flour to roll the dough soft. Roll one-fourth of an inch thick and bake on floured tin.

I hope some of the girls will try my cookies and have good luck. Florence.

Has a Pet Skunk.

Dear Young Folks:—I am thirteen years old and have passed the ninth grade. I live on a 160-acre farm. We have twelve head of horses and eight little calves. I have a bicycle which I enjoy riding very much.

I am going to tell you about my pet skunk. One night we saw a skunk running from the chicken house to a ditch. Next night we saw three young ones come out from under the chicken house. We set a trap where they went under and the next morning one of the little ones was in the trap. We shut it up in a building and at noon it was gone. The next morning it was in the trap again. We put it in a box and kept it until we made a pen. It eats birds and meat and drinks milk. It makes a nice pet. Ivan.

Tends to Poultry.

Dear Young Folks:—I am a girl eight years old and live on a farm of eighty acres. I tend to all the poultry we have. We have sixty-two ducks and I feed them morning and night. I have a hen of my own setting, and the ducks that hatch will be mine for the work I do.

When fall comes I will go to country school again and will be in the second grade.

I have three brothers and two sisters. One of my sisters was graduated from school this spring.

I will ask you a riddle. When does the rabbit sit on a stump? Ida.

Thinks Vesta Should Have a Good Time.

Dear Young Folks:—I have just finished reading the column for the Young Folks and want to write a little letter to Vesta.

I am a girl thirteen years old and my mama makes my dresses just about two inches below my knees and I think that is a pretty length.

I have a brother eleven years old and mama and papa let us go to parties once in a while, and I think if Vesta has all the housework and all her own sewing to do she ought to go to parties once in a while. Don't you? Marie.

Recipes.

Frozen Custard.—One quart of milk, one cupful of sugar, two eggs, two tablespoonfuls of cornstarch, one-half teaspoonful of salt, one-half teaspoonful of vanilla extract. Beat the eggs and sugar until well mixed; then add the cornstarch, which has been mixed with a little cold milk. Add all to the hot milk, in a double boiler. Cook for fifteen minutes. Cool, add the salt and flavoring, and freeze. Half a cupful of fruit chopped fine may be added when the custard is partly frozen.

Frozen Rhubarb Punch.—One quart stewed rhubarb, three cupfuls of sugar, one cupful of water, a few grains of salt. The pink rhubarb is best (do not skin it). When thoroughly cooked, mash through a fine strainer. To the quart of strained rhubarb add the sugar, which has been boiled with one cupful of water for five minutes. Add a few grains of salt to bring out the flavor. When cold, freeze the same as sherbet. Serve with whipped cream.

Chocolate Mousse.—Three tablespoonfuls grated chocolate, one cupful sugar, one cupful milk, one-fourth cup cold water, one teaspoonful vanilla extract, one-fourth teaspoon salt, one tablespoonful granulated gelatine, and the whip from two cupfuls of cream. Melt the chocolate, add the sugar and milk and boil one minute. Mix the gelatine with the cold water, add to the boiling mixture; when cool, add flavoring, salt and whipped cream. Pour into baking powder cans, binding the cover on with a cloth dipped in melted butter. Pack in equal parts of crushed ice and salt and let stand for four hours.

Apricot Ice.—One quart of apricots, one lemon, one and one-half cupfuls sugar, three cupfuls water. Boil the sugar and water five minutes. Crush the apricots or press them through a sieve and add to the sirup. Add lemon juice and grated rind. When cold, freeze.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Inclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date 1917 spring and summer catalog, containing over 550 designs of ladies', misses', and children's patterns, also some points for the needle. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

2156—Juniors' dress with sleeve in either of two styles. Pattern is cut in 3 sizes: 12, 14 and 16 years. It requires 4½ yards of 44-inch material for a 16-year size.

9355—Sun bonnets for ladies and girls. The pattern including both styles is cut in one size, medium, for ladies and for girls. It requires for No. 1, 1½ yards, and for No. 2, 1¾ yards of 32-inch material.

1906—Girls' dress, with sleeve in either of two lengths. Pattern is cut in 4 sizes: 6, 8, 10 and 12 years. It requires 1 yard of lining 36 inches wide for the underwaist, and 3¼ yards of material for the dress, for an 8-year size.

Waist 2152-Skirt 2153—A stylish gown. The waist 2152 is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. The skirt 2153 is cut in 6 sizes: 22, 24, 26, 28, 30 and 32 inches waist measure. It will require 6½ yards of 44-inch material to make the entire dress of one material for a medium size. Two separate patterns, 10 cents for each pattern.

2159—Dress for misses and small women. The pattern is cut in 4 sizes: 14, 16, 18 and 20 years. It requires 5⅛ yards of 44-inch material for a 16-year size.

1738—A new and comfortable bathing suit for girls. Pattern is cut in 6 sizes: 4, 6, 8, 10, 12 and 14 years. It requires 4¾ yards of 27-inch material for an 8-year size, for the suit with bloomers; without bloomers, 3½ yards are required.

2146—Ladies' kimono or lounging robe. Pattern is cut in 4 sizes: Small, 32 and 34; medium, 36 and 38; large, 40 and 42, and extra large, 44 and 46 inches bust measure. Size medium will require 7 yards of 36-inch material.

2145—A neat dress for mother's girl. Pattern is cut in 4 sizes: 6, 8, 10 and 12 years. It requires 4½ yards of 36-inch material for a 10-year size.

2149—A very attractive dress for the growing girl. Pattern is cut in 5 sizes: 4, 6, 8, 10 and 12 years, and requires for an 8-year size, 3¾ yards of 36-inch material.

1963—A new and pleasing apron model. Pattern is cut in 4 sizes: 34, 38, 42 and 46 inches bust measure. Size 38 requires 5¼ yards of 36-inch material.

2144—A simple house dress. Pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 requires 6¼ yards of 36-inch material.

1710—A neat apron for work or play. Pattern is cut in 5 sizes: 2, 4, 6, 8 and 10 years. It requires 2¼ yards of 36-inch material for a 6-year size.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for July 22, 1917.

Sennacherib in Days of Judah.

LESSON TEXT—II Kings 19:20-22, 28-37.

GOLDEN TEXT—God is our refuge and strength, a very present help in trouble.—Psa. 46:1.

Last week's lesson was a great picture of the reform of the nation. Today we have another picture which needs to be carefully put before the children. It is a national picture of a ruler and the invasion of his country. In reality it reveals the principles which are the same today, and which affect the lives of boys and girls as well as men; the dangers, temptations, the need of prayer, the need of a life of faith in God, the care of a heavenly father, deliverance and victory. It is a great thing for any nation or any individual to have such a marvelous experience of God's salvation. It occurred probably B. C. 701, the latter part of Hezekiah's reign. Assyria on the north was enlarging its borders and seeking to overcome Judea. Read parallel account in II Kings 18; II Chron. 32 and Isa. 36-37. We have on the Taylor cylinder an account by Sennacherib of the victory over Hezekiah, found in Nineveh in 1830 and now in the British museum.

I. The Situation. When the great Sargon died at Nineveh, the Syrian governments sought to assert their independence. It was a good time for Hezekiah also to assert his independence. Accordingly they refused to pay the customary tribute to Assyria. For a time Sennacherib was too busy attending to other portions of the empire to pay much attention to the city of Jerusalem. Later, however, he subdued the cities on the coast and threatened Egypt itself.

II. The Supplication (vv. 20-22). God does things because we pray. There was more power in Hezekiah's prayer than there was in his army. Through his prayers he laid 185,000 of his enemies in the grave. Hezekiah's God saved his people out of the hand of Sennacherib (v. 19). God did it. One great reason why he heard Hezekiah's prayer was because it was for God's own glory that Hezekiah asked (v. 19). One great reason why so many of our prayers are not answered is because they are selfish—seeking our own gratification and not God's honor (James 4:3 R. V.). Rending his clothes and putting on sackcloth, Hezekiah went to the house of God while his messengers sought out the prophet Isaiah. From II Chron. 32:20 we find that Isaiah joined with Hezekiah in his earnest prayer (Matt. 18:19, 20), thus the king and prophet worked as well as prayed. They showed their faith by their work (James 2:17, 18). At the same time they waited upon God for an answer, not because God was unwilling to bestow good things, or must be importuned, but that his gifts may bring the greater benefit. He sometimes delays his answer, thereby fitting us to receive them because of the intensity of our desire and to appreciate the things he has to bestow. God is as ready to say to us as to Hezekiah, "Thy prayer is heard," if we will not meet the conditions of prevailing prayer (I John 3:22; I John 5:14; Rom. 8:26,27).

III. God's Glorious Deliverance (vv. 23-37). God permitted the Assyrians to attack and they thus imagined they were having their own will and could do as they pleased, but when his "rod" had done its work, they found the difference. The God against whom they raved guided them as with a "bridle" and turned them back to Assyria. Sennacherib considered himself more than a match for God (Ch. 18:23-25) but had to return like a conquered beast of burden with God's "hook" in his nose and bridle on his lips. God allows the enemies of his people to go a certain length in order that his people may be humbled and seek him. Then he puts forth his hand and says, "This far and no farther." Jehovah gives us the same promise he gave Hezekiah, "I will defend this city." Is not the city of Jerusalem that God defends more safe than a city defended by an army? (Psa. 46:5, 6, 27:1). God had promised David that his kingdom should not perish, for in it lay the hope of the world and his plans for the redemption of mankind. Not because of the people did God defend the city, but because of his oath. This is a most dramatic picture, the mysterious destruction of the Assyrian army (vv. 35, 36). The Lord sent his angel, literally his "messenger," who applied his own plan for the accomplishment of his purpose.

There is a sort of a grim irony in the ending of Sennacherib's career. He who had so defiantly asked, "Who are they among all the gods of the country that have delivered their country out of mine hand," is led back to the house of his own god whom he imagines to be so potent to worship and in that very presence is slain by the hands of one of his own sons. The importance of this event is shown by the fact that it is referred to in three books of the Bible and probably referred to in another, occupying seven or eight chapters, besides being recorded on the great cylinder to which reference is made.

Wheat prices abroad, where the governments have control of food supplies, are shown to be much lower than in the United States by a report made to the food administration by the allied wheat commission. While wheat is selling well above $2 in this country, the government prices in other countries, according to the allied commission, are as follows: United Kingdom and France, $1.80; Germany, $1.80; Belgium, $1.60; Australia, $1.14; India, $1.35; Italy, $1.69 to $1.94. The wheat shortage has forced the allies to require the use of 20 per cent corn, rye or barley in the manufacture of flour, and most of the countries permit use of a large percentage of the cereal.

OUR DAIRY DEPARTMENT

ALL communications relating to dairy matters should be addressed to this office. Inquiries of general interest regarding dairy management and production will be promptly answered.

Butter and Cheese for Wisconsin's State Fair.

To the Editor:—Never before in the history of the dairy industry of the state were the butter and cheesemakers and the operators called upon to do their part in the production of the world's supply of food as at the present time. All of these men are handling valuable food material and every pound must be made to count for so much energy stored up. Several of these 3,000 or more men in the state are working harder this year than ever before in order that additional men may be available for other lines of work; hence we realize that the men behind the churns and the men behind the cheese vats are not loafing on their jobs. Early and late they can be found at the factory. It is not a ten-hour day, but in some cases one-half out of every twenty-four hours. Last Friday morning a cheesemaker and his helper were found busy at their work at 5:20 and with all indication that they had been there prior to 5:00 o'clock. These men feel that they are not too busy to enter a sample of their product at the coming Wisconsin State Fair.

The state fair management has set aside $2,300 as a premium fund. This is a large amount, but money gained in entering dairy products at a state fair is not the sole purpose of the exhibitors. The larger problem is showing to the people of the state what they are actually doing. Two things count in an exhibit, namely, number and quality. It is, therefore, essential that a large number of men enter exhibits in order that the two large refrigerators may be crowded to the doors. Newspaper reporters will see it and the publications they represent will print the story that will be read by the people of other states. This is free advertising for your product. The story will never be told, however, unless you, as a buttermaker and as a cheesemaker, get behind the movement and do "your bit." One hundred buttermakers and 200 cheesemakers cannot do it, but 700 or more makes a mighty strong force behind the movement. Make your plans now. September 3d, the day that the butter and cheese should be at the state fair park, West Allis, will soon be upon us.

Years of experience in dealing with Wisconsin's butter and cheesemakers has proved that a large number have made butter and cheese of high quality. They will do it again this year. In fact, we believe that conditions were never better than they are this year for the making of good dairy products. Now is the time to work with your patrons for good milk and good cream. They will furnish that kind of product when they fully realize the importance that their work bears to the quality of the finished product.

The state fair is your institution and the dairy department can be made to represent the industry only in so far as it has your coöperation.

George J. Weigle,
Wisconsin Dairy and Food Com.

A Change in Jersey Registration Fees.

To the Editor:—The amendments to the by-laws submitted on May 15th to the members of the American Jersey Cattle Club for a vote have resulted in the adoption of a new schedule of fees covering the registration of domestic-bred Jerseys. The new fees will go into effect on September 17, 1917, and will be as follows:

FEMALES ONE YEAR OLD OR UNDER.
To members .....$1 each
To non-members ..... 2 each
FEMALES OVER ONE YEAR OLD AND NOT MORE THAN TWO.
To members .....$2 each
To non-members ..... 3 each
FEMALES OVER TWO YEARS OLD.
To members or non-members..$10 each
MALES ONE YEAR OLD OR UNDER.
To members .....$2 each
To non-members ..... 3 each
MALES OVER ONE YEAR OLD AND NOT MORE THAN TWO.
To members .....$3 each
To non-members ..... 5 each
MALES OVER TWO YEARS OLD.
To members or non-members..$10 each

The American Jersey Cattle Club.

Manitowoc Holstein Meeting.

To the Editor:—Manitowoc county Holstein breeders held their annual picnic with an attendance of nearly 1,500 at the Ferd Lemberger farm near Cato on Sunday, July 1st. It was a big success and demonstrated the growing interest in the county in the black and white breed.

President Kornely and Secretary Hampke, of the association, and Mr. Lemberger provided for the entertainment and comfort of the crowd. Brief addresses were given by Mr. Commings, of Eau Claire, on "The Value of the Holstein;" by Prof. A. C. Oosterhuis on "The Type of the Dairy Cow;" Mr. Scott, emergency food agent for Manitowoc county, spoke on his work. The president and secretary both gave brief talks.

A women's milking contest was held, first prize being awarded to Mrs. Jos. Basl. Leo McConnell was awarded first prize in a boys' judging contest. The picnic was in the form of a basket social. Milk and lemonade were served to the crowd by the association, which is the largest cattlemen's organization in the county. Over 200 autos were lined up at the Lemberger farm for the picnic. The music was furnished by the Kellnersville Band.

Chas. Hampke, Sec.

Urges Sowing of Fall Rye.

To the Editor:—We are trying our best to accomplish something toward increasing the food supply in Washburn county. In my judgment, three things are most important if we are to get the best results: First, sufficient and correct cultivation of intertilled crops to control weeds and maintain a mulch; second, use of sprays for the control of insects and diseases on potatoes; third, sowing of all recently broken or cleared land and land subject to drouth in July and August to fall rye before October 1st. If we can accomplish these things I think we will have gained considerable

A. L. Albert.

APPLETON Silo Filler

Its *price* is no higher and its cost in service is much *lower*.
Guaranteed to do more and better work with less power and labor than any other. Tremendously strong construction; frame solid oak and steel, mortised, bolted, braced: impossible to pull out of line. Blower independent of cutter; allows speed adjustment for minimum use of power for any height silo. Feed table frictionless, runs on chilled iron rollers; knives spiraled, giving clean shearing cut with least use of power. (10 lengths of cut—5/16 to 2½ inches.) Easiest to handle and safest—feed rolls and table controlled by one lever; automatic safety device; low down, cut-under frame.

Two books FREE!
One on silo building and silage crops etc; the other a catalog of Appleton Silo Fillers; showing four sizes for 4 h. p. engines and up. Write
Appleton Mfg. Co., 4122 Fargo Street, Batavia, Illinois

The Appleton Silo Filler

Lansing Vitrified Tile Silo

Get the "SHIP-LAP" Joint
The quality construction in vitrified tile. End of each block overlaps onto the next. Make a stronger silo wall with less mortar line exposed. Smoother wall inside—better looking outside. Reinforced with twisted steel—continuous doorway—big ladder rungs. Hip roof gives extra footage in height.

Build it Yourself
With a Hammer and nails and a couple of Loads of "Old Faithful" HEMLOCK
The real no-freeze "KORN-KEEP" SILO

This we believe is the most practical silo in existence as well as one of the cheapest. You can positively build it yourself out of lumber every dealer has in stock, and without even using scaffolding. Painted with creosote—oil or other preservative it will last many, many years.

It is double-walled and the silage will not freeze. You can handle your silage with a fork only, the year 'round. No staves needed. No iron hoops to tighten. Self-anchored—needs no guys, has never been known to blow down; it *can't*; but if it *could* it is so strong it would *bounce* like a barrel. Any handy man can build one. So cheap that practically

EVERY FARMER CAN HAVE ONE

Hardly anyone denies that WOOD is the best thing to make and keep silage in. Here you have not only all the advantages of wood which nothing else has, but also the strength and lasting quality. Best of all it is all built out of everyday "Old Faithful" HEMLOCK boards, 2 x 4's and flooring.

Doesn't sound possible—but it's just as easy as A-B-C once you know the trick. Be sure to use "Old Faithful" HEMLOCK because it is extra fine for absorbing preservatives—and it's the farmers old stand-by anyhow.

FREE PLANS AND FULL INSTRUCTIONS
Just send for the Hemlock Silo Book, and *free plan coupon*. Mention your lumber dealer's name. Then take the coupon to your lumber dealer and he will give you the working plans and instructions free. Don't delay—send now.

THE HEMLOCK MANUFACTURERS
(of Wisconsin and Northern Michigan)

Kalamazoo ALFALFA & ENSILAGE CUTTERS

Before you buy an ensilage cutter, find out all about the *Kalamazoo*—the *only* cutter on the market having a center shear. The Kalamazoo has an unbreakable malleable knife *wheel*—not a knife cylinder. Two knives are constantly cutting toward *center*—absolutely no side-thrust. No wasted power. This center-cutting knife wheel delivers a steady, even flow of ensilage to the blower—clogging is absolutely impossible. Another big feature—

The Knife Wheel is the Blower Fan

You can't realize what a power saving this means until you see a Kalamazoo in operation. All wearing parts are easily adjustable. Cutting adjustment is on shear bar only. This makes adjustment of knives simple and easy compared with other cutters.

Get a Kalamazoo—save power—save cutting cost—feed your herd on less acreage. "Do your bit" by helping produce America's biggest saleable crop.

KALAMAZOO TANK & SILO CO.
Dept. 111 Kalamazoo, Mich.

Cow-Testing Reports.

Will Buy Heavily of Feeds.

To the Editor:—The second month's work of the Scandinavian Cow-testing Association shows us gaining. In May we had twenty-seven cows which produced forty pounds or more of butter fat, and in June we had forty cows making this record. Two more registered bulls have been bought to replace scrubs. Our first meeting was held June 30th and we have decided to purchase the next year's supply of commercial feeds in carload lots. At a

GRADE HOLSTEIN OWNED BY S. D. SHAMBAUGH, WAUPACA COUNTY.

meeting to be held soon we will hear from a feed expert. Our members are all deeply interested in our work. A grade Holstein owned by S. D. Shambeau was our banner cow for June. This cow was purchased a few days prior to freshening for $112 from a man who had never done any testing. She had no feed, but pasture during June and produced 1,842 pounds of 5.1 per cent milk, making 93.9 pounds of butter fat, or 117.3 pounds of 80 per cent commercial butter. This cow will probably be close up to the record in cow-testing associations of the state for June. Notwithstanding the good record of this grade and others in his stable, Mr. Shambeau is going to replace his herd with registered Holsteins. The forty-five-pound list for June follows:

Owner, name and breed	Age	When fresh	Lbs. milk	Per cent of fat	Lbs. B. fat

In Manitowoc County.

To the Editor:—The Manitowoc County Cow-Testing Association had seventy-two out of 475 cows which produced over forty pounds of butter fat in the month ending May 31st. Torris Geraldson's herd of thirteen registered Holsteins led the association with an average of 1,141 pounds of milk and 43.2 pounds of butter fat. Late pasture and lack of feed have prevented many cows from doing their best. We expect our next report to be more representative of the character of our cows and what they can do. The forty-five-pound list for the month ending May 31st follows:

Owner, name and breed	Age	When fresh	Lbs. milk	Per cent of fat	Lbs. B. fat
Wm. Kelly					
Snider, G. H.	10	Apr. 29	1538	4.7	72.3
Creame Wa Wa De-Kol, R. H.	5	Mar. 20	1682	4.2	68.4

Canada's Liberal Offer of Wheat Land to Settlers

is open to you—to every farmer or farmer's son who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is much higher but her fertile farm land just as cheap, and in the provinces of Manitoba, Saskatchewan and Alberta

160 Acre Homesteads Are Actually Free to Settlers and Other Land Sold at from $15 to $20 Per Acre

The great demand for Canadian Wheat will keep up the price. Where a farmer can get over $2 for wheat and raise 20 to 45 bushels to the acre he is bound to make money—that's what you can expect in Western Canada. Wonderful yields also of Oats, Barley and Flax. Mixed Farming in Western Canada is fully as profitable an industry as grain raising.

The excellent grasses, full of nutrition, are the only food required either for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent. There is now an unusual demand for farm laborers to replace the many young men who have volunteered for service in the war. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

Galloway's Complete Pumping Outfit

Engine — Double Geared Pump Jack — Drive Belt $49.95

Don't wear yourself out in hot blistering weather pumping water. Don't depend on windmills. They are unreliable and risky. Let this wonderful Galloway complete pumping outfit do this hard work, giving water when you need it. The engine is the famous Galloway 2¼ horse-power water cooled, stationary. Pump jack is extra powerful, double geared—designed especially for deep wells. Strong 16 ft. of Drive Belt. Everything complete already to hitch to pump. Besides pumping, engine will run washer, churn, cream separator, grind feed and saw wood. Simple—easy to operate.

ORDER DIRECT FROM THIS AD
SATISFACTION GUARANTEED OR MONEY BACK

Send check with order. Take 30 day trial test with money back guarantee and freight paid if returned. $6 extra for engine mounted on truck. Enclose $8.00 more if Magneto is wanted. We ship same day order is received from St. Paul, Kansas City, Council Bluff, Chicago and Waterloo. We take all risk.

FARMERS' MARKET

WANTED — FOR SALE — TO EXCHANGE

THIS department is to bring the buyer and the seller together. You may have live stock, poultry and eggs or machinery for sale. You may want to sell or buy a farm. Write your copy for the advertisement. The rate is six cents per word, each insertion.

THE WISCONSIN FARMER · MADISON, WIS.

FARM LANDS.

SILENT PARTNER WANTED—We have a fine chance to buy fine farms close to the city of Oconto, Wis., suitable for stock farms, that would feed over a thousand head of cattle, at a very low price on account of old age and death of owners. There are over 100 head of thoroughbreds on them now that would go with the farm. There is big money for the party that would furnish the money to swing the deal. Address C. S. Hart, Oconto, Wisconsin.

RUSK COUNTY LANDS! In the great potato-growing district of Northern Wisconsin, offer great opportunities for industrious farmers. We want people, looking for homes, in this ideal, partly timbered district, to write us so that we can tell them why it is to their interest to buy their lands of us. Send name and address today. Flambeau River Lumber Co., Owners, Station D, Ladysmith, Wisconsin.

FOR SALE—Two improved eighties, adjoining Missouri river, on beautiful flat south of bridge at Mobridge, S. D. Price per acre, $125. FOR SALE:—Improved Wisconsin farm, 138 plus acres, adjoining beautiful lake. About seven miles from Danbury or Webster. Price $40 per acre. Will accept farm in north river section of South Dakota for equity. M. T. Woods, Mobridge, S. D.

HARDWOOD cut-over land, silt loam, clay subsoil. Not sandy or gravelly. Close to towns. Good roads. In the heart of the dairy country. You deal direct with the owners. No agents and no commissions. Easy terms. Write for map and booklet 9. North Western Lumber Company, Land Department, Stanley, Wis.

40, 80 OR 160 ACRES good clay loam land. Hardwood timbered or open land ready to farm. No waste land. Close to towns. $20 to $25 per acre. $200 down, balance long time. F. M. Doyle, Immigration Agent, Ladysmith, Wis.

FARM FOR SALE—Within five miles of a village of fifteen hundred inhabitants. Fifteen acres cleared. $2500 worth of saw log timber. Price right, and terms reasonable. Write Healy-Brown Co., Wausau, Wis.

663-ACRE IMPROVED STOCK FARM, Polk Co., Wis.; good buildings, fences, living water; small payments, easy terms, low interest. Write for description. Mason Booth, owner, Merchants' Hotel, St. Paul, Minn.

FOR SALE—80-acre farm, 3½ miles from county seat; 60 acres cultivated; fine buildings; insured for $3,900. Must be sold. Price $6,500. Address R. J. Russell, LaCrosse, Wisconsin.

WOULD YOU SELL YOUR FARM if you got your price? Sell direct. No commissions. Particulars free. Charles Renich, G-2, Woodstock, Illinois.

BUSINESS CHANCES.

FREE for six months—My special offer to introduce my magazine, "Investing for Profit." It is worth $10 a copy to anyone who has not acquired sufficient money to provide necessities and comforts for self and loved ones. It shows how to become richer, quickly and honestly. Investing for Profits is the only progressive financial journal and has the largest circulation in America. It shows how $100 grows to $2,200; write now and I'll send it six months free. H. L. Barber, 509-28 W. Jackson Boulevard, Chicago.

HELP WANTED.

WANTED AT ONCE—Three men to work on poultry farm. Must thoroughly understand either incubation and brooding, feeding or health and sanitation. Are willing to pay good wages to the right man. Address Oak Dale Farm, Austin, Minn.

TELEGRAPHY.

TELEGRAPHY—Summer rates extended account big demand for help by government and telegraph companies. Ladies and gentlemen act quick. Wisconsin School of Telegraphy, Oshkosh, Wis.

LEARN TELEGRAPHY—Positions guaranteed. Northwestern Telegraph School, Eau Claire, Wis.

AGENTS WANTED.

BIG MONEY CAN BE MADE selling the BEST-PHONE. A new talking machine that "Speaks for Itself." Previous experience unnecessary. By our new selling plan the BEST PHONE sells itself. Write for particulars. Chas. W. Shonk Co., 138 Seventh Ave., Maywood, Ill.

MONEY TO LOAN.

MONEY to loan on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage. 6% with privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

REGISTERED HOLSTEIN BULL.

REGISTERED HOLSTEIN BULL ready for service; 2 of his dams averaged 100 lbs. milk in 1 day and 35 lbs. butter in 7 days, officially; $100. Wisconsin Live Stock Association, Appleton, Wis.

CALVES FOR SALE.

CHOICE HIGH-GRADE Holsteins, Guernseys and Shorthorn calves. A few select ones at $15 to $35 each, expressed at little cost. Write Ed Howey Co., South St. Paul, Minn.

LIGHTNING RODS.

RELIABLE AGENTS, write for 1917 agency for Diddie Burson rods. Best lightning rods sold. L. F. Diddie Co., Marshfield, Wis.

MILKING MACHINE FOR SALE.

FOR SALE—Milking machine. Two-cow unit. Automatic vacuum and [illegible] pump. In first-class condition. Address C. C. Dougherty, 33 S. Stone Ave., LaGrange, Ill.

ALFALFA SEED.

ALFALFA SEED—$8.00 per bushel. Good purity and germination but dark color. Better grades for more money. Write for samples and prices. Henry Field, Shenandoah, Iowa.

GASOLINE ENGINE FOR SALE.

TEN horse-power "Starite" gasoline engine, used about seventy hours, $100. Also elegant light station wagon and Hercules stump puller. Cheap. Millioki Stock Farm, West Allis, Wis.

HOLSTEIN COW.

REGISTERED HOLSTEIN COW, defective udder, richest breeding, bred to a High butter sire, $150. R. M. Harriman, Appleton, Wis.

BELGIAN HARES.

RUFUS RED Belgian hares. Curtiss Rabbitry, 212 Saunders St., Grand Rapids, Mich.

Crops Show Splendid Promise.

All Small Grain Looks Fine—Hay Shows Improvement—Corn Is Growing Well at Present—Milk Product Is Normal.

Brown County.—Weather has been cool and wet, but today is warm and bright. We hope for more favorable weather in order to save the clover. The crop should be cut now in order to get a seed crop. Corn and potatoes are backward. On lowland the crop killed out badly. Some grain was injured on the lowland. Pastures have improved lately and the milk flow is good. Patrons of cheese factories are getting $2 a hundred for their milk. Young pigs are scarce and high priced, selling for from $6 to $8 each. Calves have been sold off close and there are not many beef cattle. A storm in this section on July 1st did considerable damage.—S. J. Shannon.

Buffalo County.—The corn crop is good, but backward on account of cold weather. Prospects for a good yield compare favorably with those of last year. Oats and barley are heading, and promise a heavy yield. Grass in meadows and pastures shows good growth. Cattle are in good condition, but many farmers have sold off their stock pretty close, because of high feed prices and also high prices for stock. Berries and fruit are plentiful. Gardens look well.—J. G. Bates.

Douglas County.—Crops are all growing slowly because of cold weather. Old meadows will not produce more than one-half a crop. Up to the present we have had about the right amount of moisture, but a little more would be beneficial at this time. Small grains look well, although about three weeks late. Pastures are fairly good and live stock appear thrifty. Taken altogether the outlook promises better than it has for several years.—B. N. Stone.

Dunn County.—Weather is cool, with plenty of rain. Corn does not promise a good crop; it is backward and the cutworms have injured the stand. The late planting and replanting have suffered. Grain promises to yield well and hay will make about 85 per cent of a normal crop. Haying has started. Potatoes are fine, except where poor seed was planted. Small garden truck is not good. Rye looks fair. Fruit prospects are good. Live stock look well. Small pigs are receiving care.—Jas. A. Smith.

Iowa County.—Corn is growing rapidly now, but falls behind the growth of last year at this time. Cutworms did some damage, but rain and cold weather have held the corn back most. Hay, pasture and small grain are the best they have been for several years. Potatoes are excellent and garden stuff and fruit are at least normal. Cattle are doing fine; about the usual number are on pasture. Milk continues to sell at the $2 mark. Haying is in full swing.—Art G. Hoskins.

Juneau County.—Corn is two or three weeks later than average on low flat land the crop is very poor. Much replanting was done and the condition of the crop is not more than 50 per cent normal. Small grain is fine on high land, but poor on lowland. The hay crop promises an average yield. Pastures look well and gardens and potatoes are fine. Strawberries will yield heavily in this section.—E. W. Hale.

LaFayette County.—Some corn was damaged by recent high water, but not to a great extent. In general the crop is doing fine. Cutworms have done a little damage. Prospects for a crop are even better than last year, providing we have a late fall. Rain has delayed cultivation on some fields. Small grains have excellent prospects for bumper crops. A heavy crop of hay is going into the barns and stacks. New seeding yields well, but the old meadows are somewhat light. Pastures are good. Early potatoes look fine and promise a large yield. Late ones show good progress. Fruit of all kinds is plentiful. Cattle are in good health and show thrift.—W. F. Pease.

Langlade County.—Wet weather has not injurd the corn, but cutworms have done much harm. The crop is as late as it was last year, but warmer weather would put it in good shape. All other crops look well. Pastures are good. Prospects for fruit show up well. There is the usual number of cows and calves, but hogs and pigs are scarce. The spring weather was too wet and cold for poultry to do well. Feed is high and little of it is being fed.—C. Parsons.

Marquette County.—Weather is cold and rainy for this time of year. Lowland is very wet and marshes are under water. Meadows and pastures look fine. Tame hay is a heavy crop. Rye has improved very much in the last five years. Corn, beans and cowpeas show a fine stand, but cutworms have bothered them a great deal. Potatoes have a good stand. Strawberries are extra good. Live stock are healthy.—John M. Williams.

Polk County.—Weather is still cold for the season. The rainfall is just right. Old meadows are poor, but the new seeding looks fine. It will yield from one and one-half to two tons per acre. Alsike clover does better than medium red clover this year. Grain never looked better; rye and barley are headed; wheat and oats have stooled well. Potatoes are fine, but about ten days late. Garden truck looks well; some of it, however is later than usual. Strawberries are yielding a very good crop. Pastures have been unusually short this year, which has reduced the milk flow. Cattle look well, however, and all stock are normal.—P. F. Amery.

Portage County.—In general crops have not looked better for many years. Hay seems about 10 per cent better than last year and about 30 per cent better than the average for the last five years. Oats and rye are above normal. Corn has been held back by continued cold weather, but has not been damaged by rain. Potatoes are growing rapidly and so far have not been bothered by bugs. Pastures have made good growth of late and live stock are in very good condition. Creameries get more milk than ever before.—Arthur H. Peterson.

Price County.—Although corn is about two weeks late, it has not been injured. The hay crop will be somewhat lighter than last year. Pastures are fair and live stock look fine. Feeding operations show an increase. Fruit and gardens are behind, but look promising. In general crop prospects are good.—C. F. Glissendorf.

Rusk County.—Milk cows are producing better this year than last. Grass grows slower and contains more nourishment. Cattle of all kinds are in exceedingly fine condition. Because of cool weather corn is somewhat backward. There will be an average hay crop. Recent rains have improved conditions very materially and the outlook indicates that an abundant crop will be harvested.—T. M. Thomas.

Taylor County.—Corn will be a poor crop on account of cold weather. Oats look well and will yield an average crop. Rye is doing well; barley will be about average. Potatoes and garden truck are excellent. The new seeding of hay will make a bumper crop, but the old seeding will not be more than avearge. Pastures are good and live stock look well. Feeding operations have increased. Many farmers are selling calves and young stock at good prices.—J. C. Hoffman.

Washington County.—Cold, wet weather during June set the corn crop about two weeks behind as compared with last year. About 5 per cent of the crop has rotted; some of it was replanted. Potatoes are good in most places, but wherever the water stood on the land they are missing. Hay crop is excellent in this locality. Small grains are coming along nicely; oats made wonderful progress during the last three weeks; wheat promises to be extra good. Peas are poor in most places because of too much cold rain. Fruit prospects are good. Strawberries, however, are not quite as plentiful as a year ago. Indication point to an increase in feeding operations.—M. P. Salter.

Washburn County.—Warm weather has greatly improved all crops. Corn especially has been pushed forward. Potatoes are excellent. The hay crop has fallen short. Oats look extra well, pastures are fine. Rye will make 75 per cent of a normal crop.—L. D. Garnhart.

Wood County.—Warmer weather is improving corn. The crop is very late. Not many spots were killed out, but many fields show damage from cutworms. Prospects for corn are not promising. Oats are heading and look well. Rye will be good. Hay shows good promise. Late potatoes are making rapid growth. Wild pastures show a decline. All live stock are healthy, but feeding operations have decreased very much.—Fred E. Weber.

High Price for Guernsey Bull.

To the Editor:—A new high price has been paid for a Guernsey bull. This time it was B. E. Nixon, of Yountville, California, that secured from Florham Farms, of Madison, New Jersey, the bull Itchen Daisy's May King of Langwater 17349 for an $8,000 consideration.

Evidently Guernseys are looked upon favorably by California dairymen. It was not long ago that we heard of the purchase of Imp. Itchen May King 25174 from Mr. Hope by a California breeder for the then record price of the breed, $4,500.

Some of the highest prices that have been paid for Guernseys at public auction have been paid for animals akin to Itchen Daisy's May King of Langwater 17349. At the Hope sale in 1916, four daughters of Ne Plus Ultra 15265, a full brother of Itchen Daisy's May King of Langwater 17349, sold for an average of $1,493.75 each. At the 1917 auction seven daughters of Ne Plus Ultra 15265 sold for an average of $1,339.28 each. Imp. Itchen Daisy 3d 15630, the dam of Itchen Daisy's May King of Langwater 17349, was sold a number of years ago for $4,000 and her son, Imp. King of the May 9001, as a calf sold for $2,000. Langwater Dairymaid 26377, a daughter of Imp. Itchen Daisy 3d 15630, sold at the Langwater sale last fall for $6,150.

This bull will be a valuable addition to the Guernsey sires on the western coast. His sire is Dolly Dimple's May King of Langwater 12997, an Advanced Register grandson of Imp. Itchen Daisy 3d 15630, A. R. 100, whose records are 534 pounds of fat at two years and 714 pounds of fat at four and one-half years.

Gathered by Representatives of The Wisconsin Farmer.

Merriman's Guernsey Herd.

S. R. MERRIMAN, who lives a few miles west of Fort Atkinson, Wis., on the Rock river, has just about completed the remodeling of his barn, which is now up to date in every particular, and, therefore, makes excellent quarters for his splendid herd of Guernseys. His son, Clifford Merriman, who was graduated from the agricultural college of the University of Wisconsin last spring has been directing his attention particularly towards the development of a number of cows in his father's herd. He has about eight cows on test now for about five to six months that are making records which reflect much skill upon his ability in taking care of test cows. Two junior two year olds are now going at better than a 500-pound clip; one has produced 126 pounds fat in 81 days and the other 81 pounds fat in 42 days. Three three year olds are also doing well, one has produced 235 pounds fat in 167 days; another 184 pounds fat in 117 days and another 61 pounds fat in 42 days. There are three aged cows on test which are also making quite a good showing. One of these animals has produced 279 pounds in 133 days and has averaged two pounds a day for the first six months; another has produced 216 pounds fat in 135 days. Mr. Merriman has a number of very promising young bull calves for sale as well as a yearling of exceptional individuality. His sire is Bob Rilman's Monogram, a 700-pound bull and his dam is Joker's Queen, that has produced 61.83 pounds of fat in 42 days.—Adv.

Rhoda's Holsteins.

WHILE visiting the Holstein-Friesian herd of W. H. S. Rhoda, about nine miles from Watertown, Wis., a Wisconsin Farmer representative was first shown two daughters of Oak De Kol Ollie Homestead. These heifers are practically faultless individuals; one has a 17-pound two-year-old record. There isn't a full age cow in the herd with less than a 20-pound record and others have records of 28.22 pounds. Mr. Rhoda's 28-pound cow is a daughter of Canary Paul, a former herd sire of his that has many splendid cows to his credit. Markade Marie 2d, a granddaughter of Johanna Rue 3d Lad, has a 25.52 junior four-year-old record, that is a cow that would attract attention in any herd. Lady Van Beers Netherland another one of his favorite cows, made 24.22 pounds at 13½ years and is an individual that is seldom equaled. Daisy Douglas Fobes, a remarkable heifer, that made 14 pounds three months after calving is a young cow that should be heard from later. Mr. Rhoda is now using Pabst Maplecrest King, a sire that is practically a perfect individual and one that has both a seven-day and some official yearly record backing that puts him in a class among the great sires of the state. From the fact that he has been used in his herd a couple of years makes it necessary for him to be replaced and anyone looking for a high-class sire would do well to correspond with Mr. Rhoda concerning this bull.—Adv.

A HERD RECORD

With a Message for Every Dairy Farmer

THE Cloverdale Farm Herd, owned by A. J. Daugherity, Streator, Ill., averaged for 50 cows, all ages, 15,325.5 pounds milk, averaging 592.3 pounds butter. The fifty (year) records were made while feeding **Unicorn Dairy Ration** as the entire grain ration summer and winter. Mr. Daugherity has fed **Unicorn Dairy Ration** for eight years. He writes that he has found it more economical, from the standpoint of milk production, than any home ration he could combine. It makes more milk, takes less grain to do it, and keeps the cows healthy. Write for free Cow-Testers' Manual.

THE WISCONSIN FARMER

VOL. XLVI. NO. 30. THURSDAY, JULY 26, 1917. WHOLE NO. 1852

GUERNSEYS PAY FOR A FARM.

GUERNSEYS made the purchase of Ralph Tratt's 200-acre farm, near Whitewater, possible. Ralph bought the farm from his father, who also used Guernseys as a medium towards profits. Thirty-four years is a long enough time to give any undertaking a fair trial. It is just thirty-four years ago that the first Guernsey bull and his family of three heifers came to the Tratt farm. For seventeen years F. W. Tratt, the father of Ralph, worked hard and succeeded in developing a profitable herd. When he was ready to let his son have a chance at the farm he did not consider it wise to hand 200 fertile acres and a well-established herd over on a platter, so to speak. Ralph had to buy the place. He began as a hired man, passed into partnership on shares with his brother, took over his brother's half and continued on shares alone and finally purchased the farm. The only advantage he had was the opportunity. He has made the most of it and his present herd and farm bear evidence of his industry and ability. There are at present ninety head of Guernseys on the place. Thirty-five are milking and the balance is young stuff and cows about to freshen.

A most pleasing sight strikes the eye of the visitor who happens to chance in at the Tratt place and look at the string of heifers grazing in the first meadow a few rods from the barn. Irrespective of breed likes or dislikes, no one can pass without favorable comment those twelve fine-looking heifers with their almost perfect udders. These heifers, just now under test, show a uniformity of udder development that any dairyman is bound to notice and to praise. No chance breeding could produce such perfect attachment behind, such levelness at the bottom and such even carrying forward of the udder. Neither do well-placed and well-developed teats result from haphazard methods. There must be stock with ancestry behind it.

The Tratt herd has ancestry and both Tratt, Sr., and Jr., have persistently put thought and experience on every individual bred on the place. For more than twenty years—twenty-three, to be exact—nothing but A. R. bulls have been used in the Tratt herd. A Guernsey bull must show at least two of his offspring capable of meeting the requirements set by the Guernsey association before he can be classed as an A. R. bull. This requirement for two-year-old heifers is 250 pounds of fat in 365 days and for mature cows 360 pounds. This is proof of a sire's ability to transmit milking qualities which will put cows on the profitable side of the ledger. The twelve heifers, some about to finish and some just beginning on the last six months of their test, show every indication of exceeding the requirements of their class by 200 pounds of butter fat and better. They are the best evidence in favor of the methods that have prevailed on the Tratt farm in the breeding work, for they are all the offspring of one bull, Langwater Hambro.

OFFSPRING OF LANGWATER HAMBRO, FORMER HERD SIRE RALPH TRATT FARM, NEAR WHITEWATER, WIS., SHOWING MARKS OF GOOD ANCESTRY.

YOUNG STOCK TYPICAL OF HAMBRO BREEDING.

Langwater Hambro has the ancestry behind him that makes possible the showing these twelve heifers will make. He is a May Rose bull, sired by Dolly Dimple's May King of Langwater. His six nearest dams average 722 pounds of fat under official yearly test. He is a half brother to Ne Plus Ultra, the sire that is attracting so much attention in the East, having more two-year-old offspring with a high average of fat than any other bull of the breed. Both the Hambro bull and Ne Plus Ultra have the ancestry of King of the May and famous Dolly Dimple to thank for their success.

There are thirty-eight head of Hambro offspring in the Tratt herd today. Most of these are young stock, but in order to avoid inbreeding, Hambro was sold some time ago and his place has been taken by Bob Rilma's Monogram, bred on the farm. He is by Bob Rilma, a son of the cow, May Rilma, well known to Guernsey men the world over. Bob Rilma's Monogram is out of the cow, Collaludda, with a record of 702 pounds of butter fat in a year. The average of his dam and grandam is 887.5 pounds of butter fat in a year, which makes him especially strong on the production end.

There have been over fifty records made on the place, the best one of which probably is that by the cow Ringlet. She has 711 pounds of fat to her credit for the year. A half sister to her, also bred by Mr. Tratt and sold many years ago, recently made a record of 717 pounds of fat at the age of thirteen years. Ringlet's record is still better when one considers that she is a three-teated cow and that she carried a calf for eight months of her test. Miss Luetta, thirteen years of age, is also a respected member of the herd. Her record of 540 pounds of fat stands a good show of being beaten when she again freshens. Her development of milk veins, her big, strong frame and her make-up in general proph-

ONE OF THE HAMBRO HEIFERS—GOOD UDDER AND HEAVY VEINS.

CURRENT EVENTS

THAT the United States can be of greater service to England and France against the Germans by dominating the air than in any other manner is the consensus of opinion among military experts. They argue that with England controlling the water and the French at least holding their own on land, America must turn to the air and by sending an immense flotilla of airships against the enemy, dropping bombs and annihilating towns and regiments, the war can be brought to a speedy close. This being the case, without a dissenting vote or even a roll call the lower house of congress, last week, passed the $640,000,000 appropriation bill, providing for the huge airplane program with which the United States expects to carry the war to Germany and bring decision in the great conflict. It was the largest appropriation an American congress ever has passed in what is termed "a lump sum." Ordinarily, in $100,000,000 bills, and even $1,000,000,000 measures of now, congress sets forth explicitly just how the money shall be expended, specifying every item. The measure simply turns over this tremendous sum to the government for aviation purposes. And out of it the country will expect the construction of the greatest air fleet the world has known. The bill really marked a historic step in America's war, making the second big distinctive thing that the United States has set out to accomplish, aside from the gigantic preparations that all nations make for war. The first was the $500,000,000 merchant ship program. Last week it was the more than a $500,000,000 air program. It will mean government airplane factories, built and operated by the government, as well as enlarging many times the output from every private factory capable of turning out airplanes. It means the conversion of the engine plants of several of the motor factories largely to airplane engines.

RUMORS of a desire on the part of Germany—rather a willingness—to consider peace terms continue to arise every few days. A dispatch to the leading French newspaper, the Paris Temps, from Geneva, Switzerland, says the German government, according to reliable information, meditates the dramatic proposal to its enemies and to the world of a complete disarmament, except for sufficient forces to maintain compulsory peace by compulsory arbitration. "The German government," says the Temps, "while allowing the solution of the internal crisis to appear as a success for the Pan-Germanists, has in view a maneuver of a quite different aspect. The bellicose declarations which resound, and will perhaps continue in Berlin, will be nothing but the prolog, designed to represent Germany as invincible. Afterwards, perhaps sooner than is expected, will come the theatrical initiative in which Germany will show a disposition to disarm." In the meantime, however, the Germans are fighting frantically, renewing their artillery operation all along the line. The Russians continue to attack them in numbers in Galicia, but there were no decisions at arms last week which indicate an early decisive victory for either side.

WHILE the lower house of congress lost no time in passing the immense appropriation bill for necessary airships in the war, the senate is delaying matters. The senate military affairs committee reported favorably on the bill, without delay, and undoubtedly a majority of the senators favor it, but Senator LaFollette, of Wisconsin, and Senator Gronna, of North Dakota, are blocking the administration plans and forcing a delay which may cost thousands of human lives in the end. The opposition of the grain-belt senators is to that provision of the bill, as passed by the house, which empowers the president to draft men into the aviation service. The whole conscription subject bids fair to be opened up and a long debate and delay to ensue. The airship, as it is known today, was invented in the United States, but this country has lagged behind all the other great world powers in perfecting the airplane and adapting it to war uses. The airplane ranks alongside the submarine in importance in the present great world war.

A POLITICAL upheaval in Germany last week caused the retirement of the chancellor, von Bethmann-Hollweg, and the oppointment in his place of Dr. Georg Michaelis, former food commissioner, a Prussian bureaucrat, who is but little known in this country. The change is said to be a triumph of the crown prince over the kaiser, his father, and to mark a wider breach between the two. The resignation of the chancellor came in the end quite unexpectedly, for Dr. von Bethmann-Hollweg, in the prolonged party discussions and heated debates of the main committee of the reichstag, which had been proceeding all through the week, seemed to have triumphed over his opponents, who have been clamoring for his head, by making concessions which were tantamount to the formation of a kind of imperial coalition ministry. At the same time the chancellor, by the declaration that Germany was defensively fighting for the freedom of her territorial possessions, evolved a formula, that seemed satisfactory to both those who clamored for peace by agreement and those who demanded repudiation of the formula "no annexation and no indemnities." In all this Dr. von Bethmann-Hollweg, was strongly backed by the emperor. The advent of the crown prince upon the scene—summoned by his imperial father to share the deliberations affecting the future of the dynasty—seems to have changed entirely the position with regard to the imperial chancellor. The crown prince at once took a leading part in the discussions with the party leaders, and his ancient hostility to Dr. von Bethmann-Hollweg, coupled with his notorious dislike for political reform, undoubtedly precipitated the chancellor's resignation.

AFTER reviewing an infantry regiment which had had little more than one month's drill, General Leclercq, military chief of the Belgian mission which is now touring the West, declared that four months' intensive drilling would make the American soldier the equal of any who are now ready to go in the trenches. The entertainment for the Belgian mission at Salt Lake included an inspection of the United States army regiment at Camp Douglas, the forty-third infantry, which is composed of recruits who have been drilled little more than a month. General Leclercq was much impressed by the progress the men have made. Four months' time, he said, would be ample to fit them to take their places in the trenches in France. "I was particularly impressed by the way the men have responded to discipline," he said. "The silence and repose of the lines is the hardest thing to achieve and was most noticeable among the men I saw today. These things are important because they show that the men are under perfect discipline." General Leclercq was unwilling to estimate how many American soldiers it would be necessary to move to France in order to secure a prompt victory over the German forces. "Other things are necessary a well as the men," he said. "It is important to know how many big guns can be sent over and how well the men can be armed."

AN appeal to the business world to "make the conduct of this war as clean and patriotic, as heroic and self-sacrificing as it is in the trenches of France and Flanders," was issued by Carl Vrooman, assistant secretary of agriculture. "Never before have the business men of the nation shown as much patriotism as they have displayed in the United States during the past three months," said Mr. Vrooman in a formal statement. Unfortunately, however, there have been exceptions to this rule. Only recently we have seen the secretary of the navy and the chairman of the shipping board forced into the arena in a hand to hand struggle with an organization of unpatriotic, selfish, sodden steel magnates. If an army of civilian patriots be not organized to stand behind the president and fight this great fight for business honor, while our boys in khaki are fighting and dying triumphantly in the trenches, the country will be disgraced at home by a despicable scramble for illegitimate war profits on steel and coal, on munitions and food. Every day we hear men regret that they are too old to enlist. There is no man too old to make his sacrifice at the shop, the bank, the farm, the ballot box, a sacrifice of greed and partisanship."

REPRESENTATIVES of fifteen farmers' organizations, including the National Farmers' Union, conferred with members of the food administration at Washington last week and adopted resolutions protesting against the plan of senate leaders to fix a price of $1.75 a bushel for wheat in the food control bill. Enactment of the measure as it passed the house was urged, the proposed senate amendments being declared unworkable. The price fixing section as proposed, the resolutions declared, would permit "gambling, speculation and exportation to proceed without restriction." "We are strongly opposed to the fixing of the exact amount of a minimum price for wheat by law," they continued, "because we recognize that it is an expert question to be settled after such consideraion as congress cannot possibly give it, in a manner which will give the producer a full voice. The food administration should be vested with power to deal with this question."

Your tractor is only as good as your engine!

If you do not take the proper care of your engine you are inviting speedy depreciation to the extent of a goodly share of the profits on the season's crop.

Conversely the investment of a few dollars a season in a good lubricating oil, and the systematic use of that lubricant, will turn tractor depreciation into dividends.

The best lubricant for gas engine tractors, where kerosene is used as fuel, is

Stanolind Gas Engine Tractor Oil

It is an oil of great durability and maintains the correct viscosity under extreme heat conditions.

It lubricates thoroughly even the remotest reciprocating surfaces, reducing friction to a minimun.

It adds power and life to the motor.

It minimizes scored cylinders and burned-out bearings, and will keep your tractor in service.

It is equally efficient for stationary gas engines as well as for lubricating the bearings of all types of harvester machinery, and heavy gearings of tractors.

The best cylinder lubricant for Tractors where gasoline is used as fuel, is

Standard Gas Engine Oil

This oil also is an ideal lubricant for external bearings and may be used as a complete lubricant in the operating of your engine.

SAVE THEM ALL

The Nation will need every potato you can produce this year. There will also be a big export demand. Get all of them. Adopt a better and cheaper method of digging your crop. Use a

Hoover Potato Digger

Digs fast and easily

Gets all the tubers. Saves the backaches from hand digging. Digs from five to eight acres a day. Delivers all of the potatoes on top of the ground—easily seen and picked up. No weeds or trash to bother. This is delivered to the side of row. Picker attachment can be furnished which delivers potatoes in piles or in crates.

Hoover Potato Diggers represent a better investment than ordinary diggers. They give more years of service and at less cost for upkeep. Made of steel and malleable castings almost entirely. Elevator rods are offset. This promotes better separation, and prevents potatoes from falling back on elevator.

Hoover Diggers are built in different styles and sizes—there is a type that will meet your requirements.

Write for Hoover Potato Digger Booklet. Mailed free. Ask for package P—64

Unlawful to Sell Stale Eggs

To the Editor:—The practice of buying and shipping eggs case count or current receipts has come to the notice of the dairy and food commissioner. The term "case count" and "current receipts" are well understood by everyone dealing in eggs and these terms, therefore, need not be explained.

It is my belief that the pure food law, section 4600 and 4601 of the statutes, makes it unlawful to continue the practice of selling eggs case count and current receipts after the weather conditions are such that there is apt to be spoilage in eggs. The particular provision of law covering the sale of spoiled eggs is as follows:

An article of food shall be deemed to be adulterated if it consists of or is manufactured wholly or in part, from a diseased, contaminated, filthy, decomposed, tainted or rotten animal or vegetable substance or any animal or vegetable substance produced, stored, transported, or kept in a condition that tends to render the articles diseased, contaminated or unwholesome.

The law makes the sale of an adulterated article of food a misdemeanor punishable by fine and imprisonment. Spoiled eggs are adulterated articles of food.

The sale of decomposed or spoiled eggs is a direct violation of the provisions of law above quoted and on and after June 15, 1917, there will be a rigid enforcement of the provisions of this law.

There are two ways to comply with the above provisions of the law: First, candle all eggs bought and sold, thus knowing that you are dealing only in good eggs, and, second, if you cannot or do not candle to determine the fitness of the eggs you are selling and shipping, sell and bill eggs loss-off, that is, with the understanding that all eggs found to be unfit for food are to be rejected by the persons to whom you are selling your eggs.

Geo. J. Weigle,
Dairy and Food Commissioner.

Wild carrot or Queen Anne's lace (Daucus carota) is thought to be the plant from which the cultivated garden carrot originated. The garden carrot, if allowed to grow unmolested for several years, gradually loses the highly developed crown-tuber for which it is valued as a vegetable, and becomes indistinguishable from the ordinary wild carrot.

The Wisconsin Farmer

THURSDAY, JULY 26, 1917.

FAMILY CIRCLE TALKS BY THE PUBLISHER

NO TREASON HERE.

I AM delighted to be able to report that the charge of treason preferred against the farmer (on the ground that he was not only absolutely indifferent to the needs of Uncle Sam in the present crisis, but also that he was failing to buy the Liberty Bonds) has been disproved most convincingly by the large number of letters written to me as a result of my recent article. You may recall that I quoted Gov. Theodore Wold, of the Minneapolis Reserve Bank, who had issued a public statement in the course of which he said: "The farmers, who are receiving the highest prices in history for wheat, hogs and cattle, and for practically everything else they produce, are not responding to the call of their government and are displaying apathy and indifference." I gave it as my opinion then that this accusation was false and was nothing more nor less than a libel upon the farmer. Let me quote a couple of letters, selected from among many score, which I have received since then to substantiate my opinion.

The first is from a man who has farmed all his life and who modestly asks me to refrain from printing either his name or his address. Both can be had by Governor Wold, however, if he desires. The letter follows:

My Dear Mr. Pierce:—I have read your excellent paper for a good many years and I think your views on the topics of the times in every issue are worth more than what you charge us for the paper for a whole year. After seeing your request in the issue of June 21st asking the farmers that had bought Liberty Bonds to write you, I made up my mind I would write and help you all I could to overcome the charge of treason against the farmers. My wife and I have always lived on a farm and when the call came to buy liberty bonds we subscribed for $2,000 worth. I know of farmer boys in this neighborhood who have registered and are subject to draft and who have subscribed liberally for bonds. I called up the different banks of our town this evening and asked them what per cent of the subscriptions were taken by the farmers and they all said from 35 to 40 per cent were taken by farmers. That doesn't sound much like treason.

The second is from Mr. F. J. Salladay, breeder of registered Duroc Jersey swine, at Ainsworth, Iowa, and is so strong and emphatic I thought, at first, it would be best to tone it down a wee bit before printing it, but on second thought I decided to pass it along to you exactly as it came to me. Mr. Salladay wrote as follows:

Dear Mr. Pierce:—The first item that caught my attention in your paper of June 21st was that entitled "Farmers Accused of Treason." I read it through, and the charges made by Gov. Theodore Wold made my blood boil. That man is a German sympathizer and should be driven out of a decent farmers' community. I am a resident of Washington county, Iowa, and am a farmer, and if all the bonds had been bought by such as Wold my opinion is Uncle Sam would blush with shame. The farmers here did nobly. Some were afraid for a while they would be left out. Even the children were anxious to subscribe. I went to one boy and asked him what he thought of the Liberty Loan. He did not understand it. I explained, and he said, "I cannot go to war, but write my application for a $100 bond." That is the way they felt about it down here.

You asked subscribers for bonds to write, so I took the liberty, and I don't want to hear any more of Wold's pro-German talk.

My opinions have been amply substantiated; the farmers of the grain belt have been completely vindicated. They bought Liberty Bonds and they will buy them again, when the second issue is put upon the market, within the next few months. Uncle Sam need never fear that the farmers of the grain belt are not behind him, as one man, with their brawn and their brain, their money and their boys. If the downfall of the Kaiser depended only on the patriotism of the American grain belt, the war would be over tomorrow.

WORTHLESS FARM HELP.

THERE is one phase of the farm-labor situation, as it exists today, which should not be overlooked and which is most important, in my opinion. That phase is this: The inability of unskilled, inexperienced labor from the city to take the place of the trained farm boy, in the event the latter is drafted for the army.

It has become rather the fad or fashion for college boys to turn to the farm during their annual summer vacations. This year it has been more popular than ever. Some of the boys may have a yearning for country life; they may wish to clear their brains and develop their muscles by plowing corn and pitching hay before the college doors open again in the fall. But, on the other hand, there are many who seek to escape military service this year by pretending to be invaluable on the farm. I know of young college boys who boast of having "enlisted," when, in fact, all they have done is to go to the farm of their own wealthy father, or the country place of some wealthy friend, and play at farming for a few weeks or months, until the danger of being drafted has passed.

I am not making this charge without ample substantiation. I personally know of instances proving it. Moreover, I found this item in a newspaper onl a few days ago. It presents a most serious situation, in my opinion:

Government agents have been at work for the last few days investigating the cases of several farmers in the Newtown, Flushing and Great Neck sections, of New York, who are reported to have accepted money to keep sons of wealthy men on their payrolls so as to escape the draft. The agents have obtained the names of young men who registered as farmers, but who, it is said, have not been tilling the soil.

Government officials have been told that farmers have been well paid by wealthy parents to "employ" the youths. According to reports that have been openly discussed in these sections at least a dozen farmers have men on their payrolls who do not know a grub hook from a cultivator. These men, according to the story, are supposed to report daily to the farmers and to receive wages of $6 a week. Instead of working on the farm the young men are devoting their time to playing golf or driving about the island in their motor cars.

So far as I know such a situation does not exist here in the grain belt; but unquestionably many a city boy, who knows nothing about farming and has no especial knack for it, is turning to the farm in an effort to escape serving Uncle Sam in the army. This is not the kind of labor the farmer needs any year, particularly this year. Let me quote a letter from a subscriber, Mr. W. J. Loving, of What Cheer, Iowa.

In regard to the drafting of the farm boys for the army, I would say the government would make a bad mistake in taking the farm boys away to the army, because the shortage of crops would amount to more than the fuss with Germany. We are handling about 150 acres of grain and if it wasn't for the experienced help I would have to cut it down to about twenty-five or thirty acres, as I am pretty well broken down. I keep no stock for college students to experiment with. I have had my share of that. I bought a team of horses for $400, hired a town boy to work for me and he got this team tangled up in the harrow and crippled one of them till I never got the harness on her again. That ended me hiring town boys and I would not keep an old soak on the farm overnight. I want a man who can hitch up four horses and go to the field to work, without my being at his heels all the time. We have one college student in our neighborhood who stood in the field two solid hours by the watch without turning a wheel. I don't want that kind of help. We have other farmers in this neighborhood that if they have to give up their boys they will have to cut their crops down because they won't be able to handle them.

The officials in charge of the army draft will make a most serious and costly mistake if they take the farm boy away from the field on the assumption that his place can be filled by the city boy. On the other hand, no farm boy should be exempted unless he is really needed, unless he is a bonafide farmer. Our exemption boards have a grave duty before them; the success of our army in the field and on the farm depends on their doing their work well and justly.

EXEMPTING THE FARM BOY.

I FEAR some of my readers have gained the wrong impression from my continued plea for the exemption of the farm boy from army service. I have the honor to be read by fathers and mothers who have retired from the farm and who now live in the town or city. These parents love their sons fully as much as do those who have stayed by the old farm. Their boys are mechanics or clerks. Why, they write me, should the boys on the farms be exempted and these transplanted farm boys in the city be taken from their useful occupations and thrust into the awful maelstrom of war?

Let me print one of the letters—characteristic of many—before I attempt to outline my views. It comes from a devoted "mother in Israel," whose heart bleeds at the thought of her beloved son being torn from her. She writes me as follows:

I have been a subscriber to your paper for a number of years and have just read the letters from mothers of farmer boys. I, too, am a mother, but not of a farmer boy. I see that you are in favor of exempting farmer boys. Let me tell you about my boy and then you can judge which mother needs or loves her boy best. I have one boy twenty-three years old, a Christian boy. I mortgaged my house and lot to put him through high school and he always worked hard during vacations to earn his clothes and help all he could. He now has a position where he can take care of himself and help some. I would like to ask what would become of the old U. S. A. if the boys were all farmers. I would like to know who needs her boy most, the mother with 200 acres of land or the mother of a boy like this.

Now, in answer to this and the other letters which I have received, of a similar nature, let me outline my views in detail. I am not pleading for the exemption of the farm boy on the ground that he is any dearer to his mother than the city boy. Neither am I pleading on the ground that he is a better or more loving boy, or works harder or more faithfully to support his parents. I am not pleading for the farm boy merely because he is a farm boy and lives in the country rather than in the city. I am pleading for him because he is engaged in the most useful occupation there is in the land today (with possibly the single exception of munition making). We can get along without new houses or skyscrapers for a year or two; the carpenter and brick mason can be spared to become soldiers. We can—if need be—do with fewer lawyers, fewer clerks, fewer printers, even fewer preachers, for the time being. But it would be absolutely impossible for us to win, or even to carry on, the war if we were to cut down our food production. The farm boy is absolutely needed to maintain this and to increase it.

If we are to take a thousand or a million boys from the farm, there will be famine and suffering next winter, for food must be had, for soldiers and civilians alike. Food is just as necessary to the successful prosecution of the war as shells and gunpowder. A mechanic or a clerk is just as dear to the heart of his mother as a farmer, but wheat and corn and beef are more necessary just now to our nation, the world and civilization than castings and calicoes, useful as these are. That is exactly and solely why I say the farm boy should be spared to his work, even if the town boy is not.

Let me print another of the many letters I have received:

I am a subscriber to your paper and have been for a long time and am very fond of it. I noticed in a recent copy several letters from farmers and their wives expressing fear that their sons may have to go to war. I do not agree with them and cannot see why, just because they are farmers, their sons should be exempted any more than our sons who are not fortunate enough to be farmers. We are not farmers and are very much in need of our sons. We have three and all have been taken away from us to fight for their country. One is on a battleship and has gone to France, another is on a submarine at New London, Conn., and we do not know where the third is, as we have not heard from him in four weeks. There is no father or mother living who thinks more of their sons than we do. It leaves my wife and me all alone and we are on the down-hill side of life. Let me assure you it is not only farmers who miss their sons. We should all do our duty without complaining, and pray that our sons may come back to us again safely.

My heart aches for that father and mother, giving so generously of their blood to their country. I hope every one of those brave boys may be spared, to return and gladden the home which gave so nobly when the call of duty and of honor sounded. Such parents and such boys are the pride of our beloved land.

And here is still another letter, the last I shall print this time:

I have just been reading the letters of the mothers and their plea that their sons should not be drafted. Now, don't think I do not sympathize with each mother, for God only knows our hearts. The very life is being pulled away from us when our sons are taken. But I really think there is another side. I don't want to be selfish, but isn't a mechanic, or one engaged in any other occupation as far as that goes, just as dear to his mother as a farmer is to his? I am a farmer's wife and love the dear old homestead. We have a beautiful little home nestled in the forks of the Raccoon. I have one son who was a farmer until his wife's sickness drove him to other business. He is a mechanic of the best type. He is a good Christian man—no tobacco or intoxicating drinks for him, the sole support of a sickly wife, and as loving and devoted a son as God ever gave a mother. But he is of the conscription age. Now I honestly think that in the case of farmers the farms could rent for enough to keep the families, while my boy has nothing to fall back on, yet because he has no farm he is compelled to go and the single young man who has a farm to attend to can claim exemption. I can cite you to numbers and numbers of cases similar to this. I use my own son as an example.

In answer to this letter I will say this boy should find ready exemption as the sole support of a sickly wife. The law provides for such deserving cases. It would be the same if he were a farm boy. He should be spared; he is needed at home.

I hope I have made myself clear; it is the usefulness of the occupation that I found my plea upon; not undue favoritism or partiality, or anything but the good of our nation in its moment of great stress. On this ground the farm boy should be spared.

THE WISCONSIN FARMER, Madison, Wisconsin

Wheat and Rye Situation in Wisconsin.

That farmers of Wisconsin should grow enough wheat and rye during the coming year to meet all home demand and thus release for war use the supply usually shipped in was the decision of representatives of Wisconsin flour mills and county orders of the agricultural experiment association at a recent meeting of the State Millers' Association. Their plan was to increase the supply of staple foodstuffs available for war use. It would mean an increase of about 6,000,000 bushels of grain in the production of this state, since the estimated consumption is approximately 16,000,000 bushels, while the normal yield does not exceed 10,000,000 bushels.

Patriotic efforts of this kind are worthy of encouragement, but in this particular case the farmers should proceed cautiously. In so far as production can be increased by bringing new land under cultivation, by clearing out stumps, draining, grubbing and similar measures, it would be an excellent thing. But should high prices for grain and enthusiasm for a bumper yield of wheat and rye cause farmers to plow up good meadows and destroy valuable pastures, then their very purpose would be defeated. Bread is not the sole article of diet. Enormous quantities of butter, cheese and condensed milk are used in the armies and at home. Where would these products come from if Wisconsin, preeminently a dairy state, should plow up her pastures and meadows for wheat? Pastures cannot be put in in a season; every farmer knows that it takes considerable time and expense to get a good stand of blue grass. And few regions are so well adapted to growing heavy meadows of clover and alfalfa as Wisconsin. Such crops are the ones upon which the state has built up an enviable reputation, and a partial loss of them at this time would be serious.

While all of us are anxious for big grain crops next year, we must not overlook the fact that other foodstuffs also are indispensable. Of these Wisconsin has been furnishing a liberal share of milk and milk products, for which her farms are particularly adapted. If she should change over to growing wheat at the sacrifice of dairy production, some less favored territory would have to take over this work. Obviously this would be poor economy. Let each region produce that which it can produce best—this is the only way to bring the supply of foodstuffs up to the maximum. Grain production should not be discouraged. Much land in Wisconsin is particularly adapted to it and there is land not yet under cultivation that would yield excellent grain crops. But at this time a too vigorous campaign to increase grain production in Wisconsin, when combined with the lure of high prices, may turn men away from dairying who should stay in it. A big acreage of grain with a prospect of more than $2 a bushel at the harvest may look tempting to the dairyman who has felt the pinch of a shortage of dairy feed, but it is the long-time production—the average over a period of years—that counts. In another year or two the relative prices of foodstuffs may make a radical change. In most cases it will not pay to change from one line to another in order to grow each year the crops that are relatively high priced. The farmer who has land adapted for wheat and rye will do well to get it in the best possible shape for these crops this fall, but the plowing up of land for grain that is best adapted to pastures, meadows or other crops is a practice that may be seriously questioned.

New Army Drawn.

The drawing of the conscript, or national, army occurred in Washington last Friday without any untoward incidents, the first step in the assembling and training of an army of over 600,000 men to supplement the regular army and the state troops. A total of approximately 1,374,000 men were called to the colors, from which it is expected, and hoped, that one-half will be found eligible for service. To accomplish this result 10,500 numbers were drawn in Washington, the corresponding numbers in each of the districts in the entire country being ordered before the examining and exemption boards for possible service under the flag. The first number was drawn by Secretary of War Baker, the next few by other high officials; then the task was turned over to clerks, the work of drawing the 10,500 numbers consuming an entire day and far into the night. The numbers had been placed in capsules and these, in turn, placed in a large box, where they were vigorously stirred every little while, being drawn by a blindfolded person, thus insuring absolute fairness. The men whose names were thus drawn will appear before the boards without delay. Those who are physically and morally deficient will be excused at once, while the other grounds for exemption will be taken up one at a time. The district boards (varying from one to four to the state) have sole jurisdiction on the question of exemption for farm laborers, but the other exemptions are to be decided by local boards, one for each 30,000 population, with appeal to the district board. Work on the sixteen cantonments where the soldiers are to be assembled, in September or October, is being rushed to completion and the herculean task of training Uncle Sam's new army will be well under way within a few weeks.

A Word to Wisconsin Dairymen.

It has been reported that scarcity of feed in Wisconsin and high prices of beef are causing many farmers to dispose of their dairy cows. The extent to which this is being done cannot easily be determined at this time, but if the sale of dairy cows reaches such proportions as to deplete the herds in the country, a shortage of dairy products will follow that can only mean a calamity to the nation. The importance of milk and milk products for food has been emphasized until their use has reached an extent where they are practically indispensable. In many homes butter and cheese have largely displaced meat. With meat soaring toward a price that is prohibitive for many persons, a sharp decline in the supply of butter and cheese would produce a shortage in fat and protein foods, because these substances in a readily digestible form compose only a small part of a vegetable diet. The result would be undernourishment for a large part of the population.

The present reports, however, need not give alarm. Successful dairymen hold the opinion that low-producing and unprofitable cows should go to the block, and the conditions now prevalent may be an economic force to compel this practice. If this is the case, then good instead of harm will result, because the dairy herds will thereby be improved in efficiency. Too many low-producing cows have been hiding in the herd among the high producers. High feed prices may force the use of the scales and milk test to hunt out these loafers and send them to the butcher, the price of beef furnishing a stimulus for such work. Under such conditions may good come even out of high prices.

In so far as the marketing is confined to inferior stock, we may look upon the situation with favor. A relatively small herd of high-producing cows renders a much greater service in times of food shortage than a large herd of low-producing cows. Feed is used more economically and the status of the dairy industry improved. But a note of caution may be sounded with regard to marketing young stock. The same conditions which induce selling of low-producing animals may induce marketing of calves and heifers. When feed prices reach a high level, many farmers and dairymen look with disfavor upon calf raising, preferring to sell them for veal and risk the chance of buying good cows when they are needed. Experience teaches that the scarcity of good cows is a stumbling block to such practice. Good milkers are not available at anything like satisfactory prices. The surest way to build up the dairy herd lies in filling the vacant ranks with heifers raised on the farm.

Even though feed costs rule high, wherever possible the good calves and heifers from high-producing parents should be saved. They will be needed to fill the places of culls and old cows that have served their period of usefulness. If they are not saved the dairyman may come to a time when he will look in vain for profitable cows to replenish his herd. As long as the scrub stock goes to market at the lure of sky-high prices for beef, there should be no real concern, but whenever the number of good young stock falls short, the dairy industry faces a perilous situation. Let the dairyman think before he sends his promising calves and heifers to market this year; for all indications point to the fact that good dairy stock will be in great demand.

Combating Hog Cholera.

A great many swine breeders are of the opinion that the feeding of new corn is in some way or other associated with the development of hog cholera. It is presumed, for example, that hogs not accustomed to much grain when started on the new crop are thrown out of condition, their blood heated, rendering them susceptible to the disease if they should come in contact with the infection. The Wisconsin Farmer concedes that new corn fed liberally tends to overheat the blood, but a careful investigation will lead to the conclusion that hog cholera spreads in the fall more rapidly than during the spring and summer, for the reason that infection is carried more readily during the season when farmers exchange work than at any other time.

Very extensive hog cholera investigations have been made by the government, and, as a result, it was found that more than 25 per cent of the outbreaks could be traced directly to the exchanging of labor and to visiting between farms. This being the case, it follows, naturally, that where hog cholera makes its appearance on a given farm, the owner of that farm should take special precaution not to scatter the disease. This will not involve much expense nor will it entail a great deal of labor. The government has almost reduced to a science, methods of combating the spread of hog cholera. Where the disease makes its appearance on a given farm, the hogs must be handled in a certain definite way in order to cut down the loss and to prevent the spread of the disease. Sick hogs should be isolated promptly, and by this we mean that they should be put in a small pen or yard. If they are treated immediately with serum a considerable percentage of even sick hogs can be saved. Remember that infection can only be spread to other animals through the medium of the body discharges of the sick hogs. Well hogs, therefore, in a herd where the disease has appeared, should be put into other quarters and the yard to which they previously had access should be cleaned and disinfected. This means the removal of manure and the taking away of all rubbish, including logs that are sometimes used in the approach to doors and stones around watering troughs. Infection will remain in these places even for a twelve-month period. By cleaning up the yard the infection will be absolutely destroyed where the direct rays of the sun can strike the surface, and disinfecting material should only be used around fences, at the base of buildings and wherever disease germs are likely to be lodged.

Remember that it is entirely practical to care even for sick hogs without scattering the infection. Every time the pen is entered, the precaution should be taken to dip the shoes in disinfecting material. By following this plan the disease can be confined to very close quarters and the herd of no neighbor will be endangered, while the premises upon which the disease appears will be kept free from infection save only in the small pen where the sick hogs are quartered.

It has been found that dogs carry hog cholera infection freely and it, therefore, follows that the individual who allows his dog to run at large when there is cholera in the neighborhood is taking chances that a good business man is not justified in taking. While, of course, all dead hogs should be promptly burned, so the dogs and birds do not have access to the carcass, yet, as a matter of fact, this practice is not always carried out and there is constant danger of birds and dogs spreading infection from dead animals. It goes without saying that the swine breeder should be prepared to sacrifice his dog's liberty in order to protect his own herd. Every state in the corn belt can save hundreds of thousands of dollars annually if all dogs could be prevented from roaming at night during the summer and fall months.

The Seed Bed for Alfalfa.

Very good success may be attained from both fall and spring sowing of alfalfa. If the land is in proper condition and the seed is good there is little risk to run. The one important argument in favor of fall plowing is that the crop will not meet so much opposition from weeds because all annual weeds that start in the fall are done for forever and only the perennials will remain to put up a fight the following year. It is entirely practicable to prepare the seed bed for alfalfa after taking off a grain crop, but it must be remembered that it would pay well to put a good deal of labor on the seed bed. In many cases grain is shocked in straight rows, thereby allowing opportunity for disking the land between the rows of shocks and in that case the first step is taken in the preparation of the seed bed. Two or three good diskings will bring the soil into condition so that when it is plowed after the grain is removed it then may quickly be gotten into shape. In any event, considerable disking and harrowing must be done after the soil is plowed because the better the soil is prepared the better will be the stand.

It must be remembered that alfalfa takes very kindly to farmyard manure and where a supply is available it can be put to no better use than to apply it on the stubble land before disking or before plowing. In many cases the manure will carry to the land the kind of infection needed by the roots so that they will vigorously attack the nitrogen in the air and store it in the tissues of the plant.

Wherever possible the seeding should be done with a drill, as this insures a more uniform covering. In some instances half of the seed is drilled one way and the balance in the other direction, it being claimed that this will insure a better stand than where all the seed is drilled in at one time. The seeding may be done any time after the middle of August and before the middle of September. There is advantage in getting the seed in fairly early, because in that case there will be a good fall growth if there is enough moisture in the soil to bring about quick germination. Not infrequently there will be a growth of a foot or even eighteen inches and this affords a fine protection of the root system during the severe periods of the winter and spring.

The English ministry of food will take over control of the entire 1917 crop of potatoes, wheat, barley, oats and rye, according to announcement today. The orders will forbid individual dealings and will cancel all existing contracts for this crop.

Why More Wheat and Rye for Wisconsin

CONVINCED that Wisconsin could add materially to the world's supply of grain without injuring in any way her vast live stock industry, farmers, grain experts and millers of the state will unite in a push for the production of winter wheat and rye this fall. Plans for the campaign were considered at the meeting of the State Millers' Association at Neenah July 20th and 21st.

Live stock has displaced grain farming in Wisconsin. Fifty years ago our state was second in the production of wheat; today Wisconsin is not even among the first twenty-five.

With rye Wisconsin has made a better showing. Our output in 1916 was not only the largest, 6,075,000 bushels, but amounted to 12 per cent of the total production in the United States. This is because rye will grow where wheat, corn, potatoes or oats often fail.

The idea for growing more winter grain in Wisconsin is based upon a carefully considered plan. We all know that hundreds and thousands of acres of sod land are performing no special service at the present time. The reason they are not under the plow is partly because there is not sufficient help to place this land under cultivation and grow the crop, but partly also because the possibilities of raising fall grain has not been fully recognized.

This spring the farmers of Wisconsin responded nobly to the nation's call for more wheat. Though it was late in the season when the appeal for an extra effort for wheat production was sent out, crop statistics show that 33 per cent more wheat was sown this year than last. Hundreds of farmers who had long ago abandoned wheat raising planted a few acres this spring "to help the cause along." The aggregate amounted to a third more than the total planted last year. Many of the farmers frankly did so without much hope for a profit. It was patriotism and love of country that caused the extra acreage to be put into wheat. If anything, however, conditions will be more serious next year than they are now. Winter wheat and rye are two cereals which the world is greatly in need of. We can grow one of the two crops in nearly every county with a few extra acres on every farm where wheat or rye can be produced the total for our state will be tremendous.

E. J. Delwiche, in charge of the northern branch of the experiment station farms, gives probably the best plan for increasing our acreage in rye and wheat without using such land as is under cultivation now to any great extent. According to Mr. Delwiche, the old and run-out meadows now serving little, if any, towards food production, can well be turned under and planted to wheat or rye. Where wheat cannot be grown on the sod acres corn can perhaps be planted and the ground usually occupied by corn can in part be planted to wheat. Rye will grow anywhere where corn and wheat will grow and in many places where nothing else will grow. Mr. Delwiche calls attention to the big factors in favor of fall grain production, especially as they apply to the northern section. The red clay belt district and the sections where heavy soils cause considerable trouble in the spring can be better prepared for the spring crops if part of the work is done in the fall. Distribution of labor is an item on every farm. With only a few good weeks to do the entire spring work in it is highly advantageous to have a big part of the land taken care of by fall seeding. The harvest, as well as the spring work, is better distributed when fall grains are sown. Poor results in crop production in many sections of our state are in a large measure due to lack of labor. One man working part of the time in the fall and part of the time in spring is able to prepare more land, seed more grain and harvest more grain than if all the planting, seeding and the working of the land were to be done in spring.

Rye is a crop that will grow anywhere. It will grow on sod land, land of high fertility and low fertility, land well prepared and land not so well prepared. It is known as the "poor man's crop." Like any other crop, however, it will respond to good care, to the application of fertilizer and to drainage. Yields will naturally be bigger when greater trouble is taken to give the crop every chance it deserves.

Four years ago the Wisconsin Experiment Station, after years of trial with pedigreed seed among its many coöperators, the farmers, was able to announce that the pedigreed seed was superior to the common variety to the extent of eight bushels per acre. Since then pedigreed rye has been widely grown in the state and has helped to keep Wisconsin in the lead as a rye-producing state. Rye is an especially good crop for the sandy regions of our state, as it will provide a covering for the land and prevent "blowing of the land" during the spring months. Rye can be pastured fall and spring and will still produce a good crop if not pastured too closely.

Arguments have been heard in favor of planting oats because of its greater need in our state for live stock feeding. Mr. Delwiche, however, also has an answer to this. He points out that twenty bushels of rye at $2 per bushel is worth more than a thirty-five-bushel crop of oats at 75 cents per bushel. Rye does not impoverish the soil in any greater degree than any other grain crop.

According to Prof. R. A. Moore, of the Wisconsin Experiment Station, rye can be grown following almost any crop which can come off the ground in sufficient time to be prepared for rye. The natural crops for it to follow are canning peas, early potatoes and early garden crops. It can be grown on marsh lands that have been plowed during the summer and on land that has grown cereal crops. It can also be sown to corn land at the last cultivation between the rows. Where the corn has been intended for the silo the seeding can wait until the corn is removed and the ground has been disked. Very few failures have ever been recorded against rye and it will grow as well on the heaviest clays as on the light, sandy soils. Mr. Moore states that rye seems to be helped by pasturing in nearly every case except where it is sown on low, moist ground. The harvesting of rye comes sufficiently early so as to be harvested before any of the cereal crops are ready for the binder. The new pedigree rye has a stiff stem that stands up particularly well. Yields that have been recorded for rye, according to Mr. Moore, have frequently reached the fifty-bushel mark. Using the pedigreed seed instead of other varieties would increase the yield of all our rye by 25 per cent.

To prevent smut losses in the rye crop the seed is treated with formalin at the rate of one pound of formalin to forty gallons of water. The seed is spread out on the floor about three to four inches thick and the formalin sprinkled over it. It is then shoveled several times and finally placed into a pile and covered up until it is to be drilled or broadcasted on the fields. Rye can be seeded as late as October 1st.

The millers of the state have called attention to the fact that there is great need for a uniform variety of the soft and hard wheat grown in the state. Two or three different varieties of hard wheat will make a good flour. Two or three varieties of soft wheat will likewise do well. But the mixture of hard and soft wheat will make an inferior grade of flour and a poor loaf. For this reason the millers are anxious that as much as possible a standard variety of wheat be adopted and only these varieties be seeded this fall. A recent sample of wheat taken from the cars in Milwaukee as they came into the market showed two varieties of hard wheat, two varieties of soft, rye, oats, weed seed and dirt. Naturally the presence of both hard and soft wheat, other grains and foreign matter influences the grade of flour produced. The prices the farmer receives are in accordance with the kind of grain he brings to market.

In order to insure a better price for the producer and a better grade of flour for the miller, demonstrations and lectures will be given in the wheat sections of the state, calling attention to the varieties which have proved best in the tests of the Wisconsin Experiment Station and the agricultural experiment station. The difference between these two associations is that the experiment association is made up of the farmers of the state who try out grains and grasses under practical conditions after the experiment station of the college has tried out these grains on the station plots.

The wheat, which has proved its worth at the Ashland branch station and which will probably receive the endorsement of the experts, is the Bacsca variety. The Bacsca has been tried for a greater number of years than any other variety and has outyielded other varieties during a ten-year average. There are many wheats which will do well for a year, but, for various reasons, cannot repeat the sensational performances of a previous season. It is, therefore, highly important that a reliably tested strain be advocated from which results are sure to come.

Another wheat which has proved its worth in the south central and southern portions of the state is the Wisconsin pedigree No. 2, the Turkey Red, which, for a three-year average at the Madison station, yielded 36.6 bushels per acre. The highest yield reported for this wheat was fifty bushels to the acre.

Those living in the heavy loam and clay soil sections of the state can well grow wheat in the rotation. Where the soil is rich a rotation of corn, oats or barley (manured), winter wheat (seeded to timothy and clover), clover, hay or pasture, is advocated by the Wisconsin Experiment Station. The two grain crops following each other make it advisable to fertilize the ground before plowing or adding top dressing to the winter wheat.

A rotation where winter wheat does not follow a small grain crop is corn, barley or oats (seeded to clover or timothy), clover hay, hay or pasture, winter wheat (manure wheat stubble). The disadvantages of this rotation, which was also worked out by the college, are that the sod must be plowed very early, so that the soil may be compact for the wheat seed bed. This would mean a loss of the second crop of hay and the pasture in the fall.

Plowing for winter wheat should be done as early as possible, in August rather than in September. This will give the soil time to settle before being seeded. Wheat needs a firm, well-compacted seed bed. The heavy rains on the plowing will generally compact the soil sufficiently, but during dry weather the roller ought to be used, especially where large amounts of grass have been turned under. Without compacting the soil, the green mass will hold the soil from the furrow slice beneath it. Following the roller the harrow should be used to provide a mulch which prevents the loss of moisture. On heavy soils the crumbly, loose condition of the seed bed is most easily procured by disking the soil immediately after plowing. Where it is necessary the disk should be used twice and followed by the harrow. Small lumps in the field about the size of a man's fist are not necessarily an objection on a winter wheat field. Frost will pulverize these lumps and leave the ground in good condition in spring. The lumps will hold the snow on the field and prevent the freezing and thawing of the soil, which causes the winterkilling.

For the northern half of the state the 25th of August to the 10th of September is considered the proper time to seed winter wheat. In the southern part of the state seeding generally takes place between the 10th and 20th of September. There is such a thing as sowing wheat too early. When plants grow too large, and are about ready to "shoot" before winter sets in, they are in great danger of freezing out. Seeding with the disk requires less seed per acre, places the grain at a uniform depth, and will result in a uniform stand.

Wheat can be grown in various sections of the state. E. J. Delwiche and B. D. Leith, of the Wisconsin Agricultural Experiment Station, make the following statement in their bulletin on wheat growing in Wisconsin:

When grown in rotation wheat does well on heavy loams and clays but is not adapted to light soils. There is a belt of heavy, red clay soil south of Lake Superior, extending through parts of Douglas, Bayfield, Ashland and Iron counties, which is well adapted to the growing of both spring and winter wheat. The climate of this region is

THE NATION'S GREATEST MOMENT.

also favorable to the development of the wheat plant.

Another area which has been found well adapted to wheat raising is in the eastern section of the state, particularly in the counties adjoining Lake Winnebago, the lower Fox River, Green Bay and Lake Michigan.

A third wheat district is found in the western part of the state in parts of Polk, St. Croix, Barron and adjoining counties south of the northern boundary of Dodge and Columbia, have soils well adapted to wheat growing.

There is a wide belt of land in central Wisconsin, having clay loam soil, which, at least so far as can be judged by their physical composition, seems adapted to wheat growing. Experiments begun on these soils in 1911 seem to indicate their suitability to winter wheat production. Good results were obtained in 1911 with both spring and winter wheat, and winter wheat did exceptionally well again in 1912.

In addition to those already mentioned smaller areas equally well suited to wheat raising are to be found in other sections of the state.

Fall grain growing is not Wisconsin's chief industry, nor is it the intention of the wheat and rye advocates to attempt to change our live stock husbandry into grain growing. But it is possible to add wheat to many farms in Wisconsin where it is not now grown or where it is grown in a small measure only. The big increase of our acreage of spring wheat is a good indication of what Wisconsin is willing to do and can do, without any falling off in her beef, hog, and dairy production. The movement ought to find enough support in the state to make a big showing in 1918. It will be another proof of Wisconsin's loyalty and patriotism, and it can be done without serious loss to our present enterprises.

A GOOD SAMPLE OF WISCONSIN PEDIGREE RYE.

Guernseys Pay for a Farm.

(Continued from page 1.)

esy that there is every chance of this being possible.

All of the records are made under natural conditions and each cow is bred to produce a calf within three months after finishing the year's work. No extraordinary means are employed in feeding or milking the cows. A grain ration of ground corn and oats, bran, oil meal and a commercial feed are proportioned out to them as their production warrants it. Alfalfa hay is fed in abundance, together with silage and clover. Only cream is sold from the farm and the skim milk goes to the calves and hogs.

The silos take care of thirty acres of corn each year, and, though they look small, they are squat and extend twelve feet in the ground. They open into the barn. The barn built into the side hill makes it possible to have a basement barn facing south and west, admitting plenty of light and air. But Mr. Tratt does not depend upon windows and doors alone for his ventilation. A modern system of intakes and outlets with an aerator on the roof provides fresh air the year around. Foul odors are carried up and out with a rapidity that the system guarantees. The barn is whitewashed twice a year, or as often as necessary in order to insure clean walls and ceilings. The whiteness of the walls gives the barn a clean and bright appearance even on darker days.

Mr. Tratt believes in conveniences on the farm. Electric light, running water, furnace heat and an office in which to keep records and correspondence were, therefore, included in the ten-room house which he erected several years ago. The rooms have been arranged according to a practical plan. The sitting room has not the appearance of the old-time parlor, though it supplanted it. Wide entrances give it the look of comfort and ease so lacking in old-time structures. Comfortable also are the chairs that have replaced the stiff-backed upholstered ones of years ago. A large talking machine shares honor with the piano in helping to entertain visitors.

One feature not so frequently met with on a farm has also been introduced at the Tratt farm home. That is the sleeping porch which for three years has been made use of every night without a single exception. Winter or summer makes no difference. Mr. Tratt and his family have become so used to sleeping out-doors that they would not trade back now under any consideration.

Electric power from the city of Whitewater provides the light in the home and in the barn and motors attached to the current pump the water and run the separator. Just a push of a button and the machinery is in motion.

No wonder that Mr. Tratt considers the city life with disdain. His house affords him every convenience that the largest city could provide, his farm a better living than most business enterprises could offer.

TRATT MAKES USE OF HIS SILOS AND A MODERN VENTILATING SYSTEM.

Moline Corn Binder

Save All Your Corn Crop This Year

You'll need the 40% crop value in the stalks; and you can rely upon the Moline Corn Binder to do a clean job of harvesting, no matter what condition the crop is in.

Gathering boards extend 5 1/2 feet in advance of knife, straighten up down corn before cutting. Properly set springs and shields prevent clogging by short stalks, weeds or loose leaves—insure steady work.

Conveying chains deliver corn to binding device in perfect order. You get smooth, firmly-bound bundles with unvarying regularity—no missing.

Lightest running main wheel in the world. All carrying and driving friction is eliminated by self-aligning, anti-friction bearings.

Solid steel main frame holds working parts in easy working position at all times—insures long life and good service under hard strain.

Ask your Moline Dealer about the Moline Corn Binder, or write us for Illustrated Literature.

SILBERZAHN ENSILAGE CUTTERS

The Gehl-Silberzahn is known as "the King of Ensilage Cutters" because of its simplicity, safety, convenience, clean cutting and great capacity. The new models are better than ever — the result of 25 years' experience in building ensilage cutters exclusively. All-steel frame; low-down feed table; positive safety device; automatic feeding device; six fan blower that simply CAN'T clog; malleable knife heads; best knife adjustment.

Write for Catalog showing 10 sizes. Gives full details and explains HOW and WHY the Gehl-Silberzahn is BETTER. Get this catalog BEFORE you buy a cutter. Write today — a postal will do.

Arsenic Soon Kills All Blister Beetles.

Arsenate of lead and Paris green are effective destroyers of the several species of blister beetles that attack vegetables. Spraying or dusting these poisons on the plants is necessary several times in a season for complete control, since these insects are especially hard to kill.

For large areas spraying with three pounds of arsenate of lead paste and a pound of Paris green in fifty gallons of water is recommended by the Ohio Agricultural Experiment Station to kill blister beetles. Potatoes are frequently attacked by blight, which can be controlled by Bordeaux mixture made of four pounds of copper sulphate and five pounds of hydrated lime in fifty gallons of water. If the arsenate of lead and Paris green are added to Bordeaux instead of water, both insect and disease injuries will be prevented at one operation.

Applications must be made soon after potatoes are up and later at intervals of two weeks, if necessary, for complete protection, the experiment station entomologists say.

For small gardens Bordeaux mixture may be made by dissolving an ounce of copper sulphate in half a gallon of water, and an ounce and a half of hydrated lime in a half gallon of water, and then pouring the two solutions together. To this are added for blister beetles an ounce of arsenate of lead paste and a third of an ounce of Paris green.

Some gardeners are fairly successful in controlling these pests by dusting plants with poison. An ounce of arsenate of lead powder and a third of an ounce of Paris green may be mixed in a pound and a half of fine lime and dusted from a cheesecloth bag or a small can with a perforated top.

Blister beetles are striped, spotted or plain black or gray. They have slender bodies about half an inch long, with long sprawling legs. Potatoes, beets, beans and peas are their favorite hosts.

Discovery in the internal revenue division laboratory of a process for manufacturing glycerine from sugar was announced by the treasury department. Under the secret process evolved, the cost of this substance, a heavy factor in the manufacture of explosives, will be reduced to slightly more than one-fourth of its present cost. Glycerine is at present manufactured almost entirely from fats, at a cost of 90 cents a pound, which is six times its cost of production before the war. The discovery is the first to be announced by chemists working in cooperation with the council of national defense.

An Agricultural Patriotism.

Portions of an Address, July 4th, by L. F. Graber, of the Wisconsin Alfalfa Order, and Green County Emergency Food Agent.

This is a day and age of rapidly upward soaring prices for land and labor. It is a time when we are realizing the highest prices for agricultural products the farmer has known since the civil war. It is a time when the nations of the world are crying for more food. With 40,000,000 men withdrawn from the fields of productive industry and drafted into the destruction of life and property which accompanies all warfare—with the unfavorable seasonal conditions which universally prevailed last year—a crop shortage and a food shortage has occurred which has reflected itself in the unusually high prices for food products and which is vitally affecting the peoples of every land. It is this tremendous food shortage that prompted President Wilson in his message to the people of the United States to emphasize in no uncertain terms that the winning of the war is in a large measure dependent on the American farmer. It is his patriotic responsibility to feed not only the army and the 100,000,000 Americans, but to help feed the armies and peoples of those nations who are now our allies in this great war. And so the farmer is the "soldier of the furrows" and it is his patriotic duty to produce more than he has ever produced before. The soldiers of the trenches will march to battle shouting the "Battle Cry of Freedom." The soldiers of the furrows will march to battle with the weeds, weather and pests shouting the battle cry of "Feed Them." And in this food production battle for humanity much will depend on the kind of ammunition and weapons the farmer will use. The silos are our most powerful guns in bringing down the high cost of winter feed. Corn and alfalfa are the ammunition for cattle that produce the cheapest and greatest amount of meat and milk. Particularly in this year when food production is a patriotic necessity it is becoming necessary for live stock farmers to grow chiefly those crops which work hardest for them—those crops which produce the most and bring the greatest net returns for the labor and effort applied. In Green county there are two crops which stand foremost in the production of feed per acre for live stock—corn and alfalfa—corn for silage, alfalfa for hay. They are the two crops when grown successfully make a combination on any farm that for feed production, milk production or meat production cannot be beaten. An acre of alfalfa will produce three times as much actual feed as an average acre of timothy. Yes, I know there are arguments for timothy. We say it is easy to get a catch and that it seldom winterkills, but it still remains that timothy produces the least amount of feed and the poorest quality of feed for cattle when compared with clover or alfalfa. On the $150 land of this county timothy will continue and must continue to give way in importance and area to those superior feed-producing crops—alfalfa, clover and corn.

Green county leads the state with her 28,000 acres of alfalfa, but we are behind on silos. Of the 2,465 farms, only 889 have silos—only one out of every three. In Sheboygan county 80 per cent of the farms are equipped with silos. If there was ever a time when the dairy farmer who has not a silo should be so equipped it's right now. The hay crop is short. Corn is behind. Frost may get it next fall. You can get double the amount of feed from an acre of frosted corn if you have a silo. There is no cheaper or better succulent winter feed known in the world than corn silage for Green county farmers. Get your order for a silo in today. It may be very difficult to get silos later on, as several factories are already oversold. A silo and alfalfa on every farm in Green county spells—Agricultural Patriotism.

Boys' and Girls' Calf Club.

To the Editor:—There are many boys' and girls' calf clubs, but only a small percentage handle pure breds. The first pure-bred Holstein heifer calf club of the United States was organized at New Douglas, Illinois, by Charles A. Prange, a banker of that town. From Chenango county, New York, and other centers of high-class Holstein breeding, he bought seventy-five pure-bred Holstein heifer calves, descendants of or closely related to cows that have made official records of thirty pounds or more of butter in seven days.

These calves arrived at New Douglas just after pasture grass started. The boys and girls who had signified their wish to become members of the calf club each drew a number and the calf marked with that number became their property after they had given a signed bank note bearing 6 per cent interest for the animal.

October 17, 1917, or as near that date as arrangements can be made, the animals will be offered at public sale by the celebrated Holstein auctioneer, Col. R. E. Haeger, who has generously donated his services for this occasion. Noted speakers and men high in the dairying and political circles of the state will be present and speak. The Southern Illinois Milk Producers' Association, numbering 2,600, is expected to make a field day of this occasion.

The animals, handled by their young caretakers, will be led into the ring and auctioned off and the amount of money each one realizes will be given to the young owner who also has the opportunity to win one of five money prizes given to the boy or girl who owned and took care of the five animals bringing the highest prices.

It would be difficult to think of a better plan to inculcate the desirability of good care and feed or of the advantages of pure-bred animals. Every youngster who has taken care of an animal and realized a goodly profit on it will thereupon be thoroughly inoculated with the pure-bred fever. The Holstein-Friesian Association might, with good results to the breed, make a small donation from its surplus toward such a laudable enterprise.

G. H. Truckell.

Save Every Ton of Hay.

To the Editor:—I want to suggest to the farmers of Wisconsin that they should get every ton of hay that it is possible to get. Be sure and cut all the wild hay and save it and get ready to feed stock without buying hay. There is still time to sow turnips in the corn before laying by. Under favorable conditions turnips will make a large amount of food for man and stock. Crops are looking fine in our neighborhood. The potato crop will be a winner from present indications.

W. W. Clark,
Emergency Food Expert, Wood county, Wisconsin.

Poison ivy will not be killed by a single cutting, as new shoots or suckers are persistently sent up from the rootstocks. The rootstocks must be exhausted by destroying the foliage as fast as it appears, either by repeated mowing or by spraying with a strong salt brine made at the rate of three pounds of common salt per gallon of water. If the weed is cut or sprayed in June and the treatment repeated about three times at intervals of ten days or two weeks, the rootstocks will become exhausted and die. Arsenite of soda (a violent poison), one-fourth pound per gallon of water, or crude oil may be substituted for the salt spray. Spraying does not affect the roots directly, but is simply equivalent to cutting. However, there is the advantage that one need not come into actual contact with the plant.

AREYOU GOING TO BUY LAND?

IF SO, GET A COPY OF OUR JOURNAL FIRST. It has lands, city property and stocks of goods advertised in its columns from nearly every state, so that you can find just what you're looking for in its columns. A Bigger Yield From the Same Field.

From any field that you have been manuring by the hand method you can get a bigger yield if you use the spreader method—and save much time and labor.

A good spreader tears up the manure into small particles and spreads it evenly. The manure goes farther. It can be worked well into the seed bed so that the plant roots get all of its valuable plant food. *Wasting manure is like wasting money—a good spreader makes every particle of manure count.* A Newton County, Ind., farmer testing the spreader and hand methods of applying manure on two ten-acre tracts found that the *spreader method gave 120 more bushels of corn, 140 more bushels of oats and 9 more tons of clover.*

The John Deere Spreade.

The Spreader with the Beater On the Axle

has special capabilities for increasing your crop yields. Its exclusive features make it the ideal implement for the best method. Ask any owner of the John Deere Spreader about the way it increases crop yields and saves time and labor. After you have operated a John Deere Spreader of your own for a year, you will fully appreciate how much these gains really mean. *You'll find that the Spreader with the Beater on the Axle more than pays for itself in one year from the gains it gets on even a fair-sized farm.*

The beater on the axle construction *eliminates all chains, clutches and scores of other trouble-making parts. Does away with half the types of castings otherwise necessary. Does away with adjustments. Puts upkeep at minimum. Makes the John Deere Spreader exceptionally long-lived.*

Beater is all steel—practically indestructible—runs on roller bearings, aiding light draft. Beater teeth spirally arranged—tear up manure perfectly and distribute it evenly. Deliver manure close to the ground—wind does not affect spreading.

Revolving rake feeds manure to beater evenly, aiding in uniform distribution. Shock - absorbing spring relieves spreader and horses of sudden strains.

Spreader only hip-high to top—easy to load. Big drive wheels—light draft. Ball-bearing apron drive—apron travel frictionless. Simple gear attachment keeps weight of load from making apron race when spreading up hill.

Easy to operate—only two levers—one lever determines number of loads spread to the acre; the other starts and stops the spreading. It's so simple, a boy can operate it.

Wide-spread attachment for extra wide spreading.

Write for booklet on the John Deere Spreader.

30% of the Corn Crop's Feeding Value Is in the Stalk

You save money by cutting your corn and putting it in the silo or feeding it to stock in the feed lot—because thirty per cent of the entire feeding value of the corn crop is in the stalk.

John Deere Corn Binder

A Labor and Crop Saver

Inspect the Power Carrier—a Great Improvement.

The John Deere Corn Binder saves corn that is lost by binders equipped with the old style tooth carrier. The power carrier delivers into the windrow all loose fodder that is discharged onto it with the bundles. *Requires no leg power* or effort to operate it. It places all the *bundles out of the way* of the horses when three horses are used abreast. This carrier is *always ready* to receive the bundles.

The John Deere Corn Binder can be *turned quicker than the horses turn.* There is no dragging of binder at any time. *Square corners can be turned* and the horses are relieved of neck weight. The all-steel, quick-turn tongue truck makes this possible.

Write for free book, "The Better Binder."

Big Book Free

Better Farm Implements and How to Use Them

America must produce more food. Labor-saving implements will play an important part in increased crop production.

This book tells all about a full line of labor-saving farming implements. Tells how to adjust and operate many of them. A practical farm implement encyclopedia. Worth dollars. Illustrates and describes the following machines: Walking and Riding Plows, Tractor Plows, Disc Plows, Disc Harrows, Spring Tooth and Spike Tooth Harrows, Corn and Cotton Planters and Drills, Listers, Alfalfa and Beet Tools, Grain Drills and Seeders, Riding and Walking Cultivators, Lister Cultivators, Mowers, Side Rakes, Loaders, Sweep Rakes and Stackers, Hay Presses, Grain and Corn Binders, Corn Cutters, Stalk Cutters, Kaffir Headers, Manure Spreaders, Portable and Inside Cup Elevators, Corn Shellers, Wagons, Farm Trucks and Buggies. This big book will be sent *FREE* if you state the implements in which you are interested and ask for Package X 640 .

Uniformity in Implement Manufacture

means much to you. You want to feel safe that every implement you buy is up to standard. Getting implements whose quality and workmanship is up to standard is a matter for your serious consideration.

Specialization — different factories for different classes of tools, each directed by specialists pre-eminent in their particular line—control of all the processes in the manufacture of implements from the leading raw material used to the finished product; and rigid adherence to exact duplication of trial implements whose qualities have been fully tested in actual field work, all combine to make John Deere implements uniform in quality and design.

JOHN DEERE, MOLINE, ILLINOIS

HAY MAKES GOOD YIELD.

Clover and Alfalfa Harvest Is Good—Small Grains Are Ripening Well —Cool Weather Delays Corn—Live Stock, Especially Dairy Cows, Show Fine Condition.

WISCONSIN.

Barron County.—We have had considerable rain during the last two weeks. Small grain looks well. Winter rye is very good. Potatoes will yield above the average. Because of dry, cold weather in May and June, hay will fall below the average. Corn is poorer than the five-year average because of the late spring. Nearly everyone has a large garden. Live stock of all kinds look well; very little is being fed, dairying being the main industry.—Wm. Bartlett.

Calumet County.—All crops are fine. Potatoes look well, but some have rotted. Corn has grown well on high land, but on wet land was drowned out. Peas and beans are ripe. Pastures are good. The clover crop promises well this year. Gardens look well.—Joseph Buchinger.

Crawford County.—We are having good growing weather except that it is a little too wet for corn on heavy soil. On sandy soil the crop is doing fine. Prospects indicate a bumper crop with a favorable fall. The harvest of winter wheat, rye and early oats has commenced. Wheat and oats are well filled and will make good crops, but rye did not fill as well as usual. A good crop of early potatoes is assured. Late potatoes are growing well. Vegetables are plentiful and fruit promises a large yield. Farmers are busy making hay. Cattle on pasture show a healthy condition.—George Ashbacher.

Dunn County.—All grain crops look fine; they are fully equal to those of last year, except corn. Storms have done no damage, but rains have left the ground full of moisture. No more rain is needed until after the grain harvest. Pastures are excellent. All live stock looks well and free from disease.—E. A. Finley.

Eau Claire County.—Oats and barley are doing well. The barley crop filled well, but the stand is a little thin. Oats have started to head. Rye has made good growth and has filled well. Clover hay looks patchy and the weather has been poor for putting it up. The timothy crop is light. Corn seems to be doing very little because the weather is too cold. On lowland it has not grown much for three weeks. Pastures are good and cattle look well. Crops in general are hardly up to average.—C. A. Koll.

Florence County.—The hay and grain crops are below normal. Cold, wet weather has caused rotting of potatoes to some extent. Corn looks bad. Gardens are backward. Live stock are in normal condition and no diseases have been reported.—Phil Kelms.

Forest County.—No damage was sustained from heavy rains, but cool weather delayed planting. Corn is grown here only for fodder and silage. Cool weather benefitted the small grains, which look better than usual. Old meadows will be light, but the new seeding promises a big yield. Live stock are excellent and the absence of flies has favored the cattle very much.—H. A. Kamm.

Iron County.—Heavy rains and cold weather have delayed all crops. Potatoes look well. Meadows will not make more than 75 per cent of a crop. Little haying has been done. Pastures are good. Small grain and corn are short, but look fine and may make normal crops. Live stock look well and their number is increasing.—J. A. Becker.

Juneau County.—Although still small and backward, corn has made a start on the upland; on the lowland it is very unpromising. Small grains look fine; wheat promises the best crop for several years. Rye also promises well. A big acreage of buckwheat was sown, perhaps 25 per cent more than normal. Potatoes look fine and the acreage is above normal. Hay will make a full crop, but the weather is bad for saving it. Live stock are healthy and doing fine, but no feeding operations are under way.—J. W. M.

Kenosha County.—Corn is backward on account of cold weather, but has the best stand it has had for several years. A good crop of hay is going up at this time. Potatoes look fine. Cabbage and sugar beets are excellent. Gardens will yield abundantly, but fruit it not plentiful. Excessive rains have stimulated pastures. Cattle are doing well.—Geo. Kreuscher.

Kewaunee County.—At least 5 per cent of corn planted was lost by excessive rains, but it was replanted and now is doing well. Small grains, grasses and garden truck are all about two weeks late, but show excellent condition. Potatoes look well. Haying has begun and promises to make more than an average crop. There is a shortage of spring colts and pigs.—Fred Lutz.

La Crosse County.—Corn is late. Wet weather has hindered field work and some fields are getting grassy. The hay crop is heavy, but haying has been delayed by rain. Pastures are not looking well, but small grains are fine. A large number of young stock, in only fair condition, has been sold to the packer. The tendency seems to be to reduce the number of feeders. The early potato yield is lighter than usual and some of the potatoes have rotted. New potatoes are selling for about $2.40 per bushel.—S. J. D.

Marinette County.—Corn has been delayed by cold rains. On lowlands some replanting was necessary because of drowning out. Warmer weather prevails now and the crop has made a fair start. Potatoes never looked better, especially the early planting. Bugs are appearing, but have done no damage. All small grains look well, pastures are good, haying has started. The hay crop is about two weeks later than usual. New meadows are good, but old meadows are thin and the whole yield will fall below that of last year. Live stock look well. Small fruits are late; strawberries are good and also the early cherries. Apples are not promising much this year.—H. B. Pederson.

Ozaukee County.—The corn crop looks poor this year because of too much rain. Potatoes are fair and hay is plentiful. Barley will make a fair crop. Pastures are short and meadows are poor because of too much rain. Live stock are in good condition. Feeding operations show an increase.—J. N. M.

Polk County.—The heavy rains have done no damage to this county. Corn is still backward, but growing nicely now. Small grains never looked better. Newly seeded meadows are good, but old ones are thin. Pastures look well and live stock show good condition. Butter fat brings 40 cents a pound. Hogs will be scarce and high priced this year. A larger acreage of beans than usual was planted and they look fine. All gardens and fruit are doing well.—Wallace Fountain.

Richland County.—On lowlands the corn crop was damaged by cold rains. The crop is later than it was last year; much of it stands less than waist high. Oats look well. Barley is good. The hay crop promises a good yield. Pastures are fair. Fruit is plentiful.—E. C. Stewart.

Sauk County.—In general the corn crop is below normal. Continued cool will make the prospects of a mature crop very doubtful. Pastures and meadows are all that could be desired of them. Since pastures are good and feed costs are high, little summer feeding of cattle is in progress. The first crop of clover is making from three to five tons per acre. Weather conditions are retarding the harvesting of this crop. Small grains look promising, except where drainage is poor and the soil sandy.—Richard F. Klemm.

Shawano County.—The corn crop is very backward except on sandy land. During the last three days, however, it has grown splendidly. On lowland the crop looks worse than it has for years, but we have hopes of a fair crop, at least for silage. The yield depends largely on the conditions during the next sixty days, or eighty days. Small grains, such as rye, oats, barley and wheat, look much better than last year and should equal the average for the last five years. Hay is later than a year ago, but the new seeding is unusually fine. Pastures are splendid. Thousands of acres of good clover are going to waste on cutover land in this part of the state because of lack of live stock. Gardens are better than for years. Insects have bothered very little. Live stock never looked better in this vicinity. All crops with the exception of corn are as good as they have been for the last thirty years.—M. H. Wallrich.

St. Croix County.—The number of cattle and hogs is about the same as last year. Pastures look well and cattle show good condition. There is a tendency to ship more calves to market than formerly. The high price of milk and the high price of veal combine to bring this about. With cheese at 24 cents a pound it hardly pays to keep the calf longer than it takes to get him ready for market. Most of the cattle in this region are mixed breeds, but they follow the dairy type. The unusually high price of corn hastens the marketing of cattle and hogs before they are finished. The outlook for corn is poor and the pea crop is below normal, which does not promise well for the pork raiser. Rye and barley will make good crops. Hay will yield well. The fields of wheat and oats are fine.—Stephen Iversen.

Taylor County.—The weather has been fine for all kinds of grains, meadows and gardens. However, the nights are a little cool for corn, tomatoes and cucumbers. Hay and clover look fine and will make fair crops. Some harvesting is now in progress. Corn is small and late. Potatoes promise a full crop and the acreage is above normal. Pastures have done well and dairy stock show good condition.—John E. Miller.

For Your 1917 Corn Crop

THE **International Ensilage Cutter** shown above is a good size for individual use, or for neighborhood use wherever a medium-capacity machine is required. Note how simple and compact it is, and how safely the gears are housed.

Then there are both smaller and larger Internationals. Type F is the lightest-running cutter made—you can run it with 4 to 6-h. p.; capacity 3 to 6 tons per hour. The larger sizes will put up to 25 tons per hour into the silo, and a 25-h. p. engine will handle the heaviest loads.

Corn growers everywhere know that **International Ensilage Cutters** cannot be beat for uniform cutting, high elevation, safety and durability. They fill silos at the lowest power cost. Every feature of these cutters, the knives and blowers on the same flywheel, the carefully machined bearings, the complete oiling system, the absence of all unnecessary gears and sprockets, the steady feed arrangements, all tend to make them easy running and power saving.

The International you choose—of whatever size—will do the good work it was built for, at the lowest cost. That you may feel assured of. Our catalogues will tell you of all the details. Write the address below.

International Harvester Company of America
(Incorporated)
CHICAGO U S A
Champion Deering McCormick Milwaukee Osborne

GALLOWAY'S TRACTOR

"Pulls Anything, Anywhere, Anytime." That's what users say!

A four wheeler delivering 12 full horse power on the draw-bar (with a surplus of 4 h. p. by actual dyamometer test) and 20 h. p. on the belt (with a surplus). Four cylinder, valve in the head, water cooled, long stroke, modern gasoline motor, transmission a unit with motor. The Galloway Efficiency Farmobile gets its name because of the small amount of power lost between engine and draw-bar. We have exclusive right on this patented transmission. By actual test its sustained efficiency at the draw-bar is 86.7%. That's why it "pulls anything, anywhere, any time." Will do any portable engine job, sawing, silo filling, corn shelling, shredding, pull 28 in. grain separator, feed grinding, pumping for irrigation, etc. Will handle three 14 in. bottoms 8 to 9 in. deep in clover and timothy sod. For building roads, dragging and grading it cannot be excelled. Double chain drive, gears run in oil tight case in oil bath; rear wheels 58 in. high; 15 Hyatt roller bearings and 6 ball bearings used in the Galloway Efficiency Tractor. Extra heavy duty motor, Schebler carburetor, Eiseman magneto, Pierce governor, engine never races; ball wheel sprockets and chain, covered; only two levers to control it; one man operates tractor and plow with ease. As far ahead of one and two-cylinder tractors as four and six cylinder motor cars are ahead of the old style one and two cylinder cars.

Let Us Show You

WEIGHT ONLY 5000 LBS.
LOW PRICE A BIG SURPRISE

If you want to see the most efficient 12-20 h. p. farm tractor on the market today, get on the train and come to Waterloo or send for our literature telling all about this new, wonderful Galloway Efficiency Tractor with its patented transmission—the secret of its wonderful efficiency. Address

ENGINEERING COLLEGE AUSTIN, MINN.

More About the Big State Fair.

Mr. F. M. White of Madison, to Have Charge of Tractor Show Which Will Be a Big Feature of the Fair.

THE Wisconsin State Fair for 1917 will be held at State Fair Park, just outside of Milwaukee, September 10th-15th. Weather permitting, it will be the biggest fair that has ever been held.

High spots in this year's program are a tractor show of more than ordinary proportions; a market and food exhibit, showing preparation, marketing, shipping and distribution of food products; $50,000 in premiums and several new classes for live stock; a new $25,000 poultry building; an automobile show of new and of used cars; and, lastly, repainted buildings and properly drained grounds.

Since the state fair has come under the direction of the state department of agriculture a steady improvement has been noticeable in the fair each year. Under the old system buildings and grounds were rapidly getting into poor shape. Now each item of expense and each necessary improvement is properly taken care of in businesslike fashion. Each department of the fair is under the care of an efficient superintendent with a practical knowledge of the work.

F. M. White, of the agricultural engineering department of the university, will have charge of the tractor demonstration. The demonstration will be held in the morning on 1,200 acres of land near by, and the tractors will be on exhibition in the afternoons and evenings on the grounds. Wisconsin stands alone in providing a tractor show for her citizens in connection with the state fair. But Wisconsin's fair officials, and Sec. Oliver E. Remey in particular, are strongly in favor of demonstrating every piece of machinery which will increase the man power per acre and result in greater and more economical food production. There are now only about 1,000 tractors in the state, which has some 220,000 farms of various sizes. Not all these can make use of a tractor, but thousands of them can and will do so as soon as they are convinced of the possibilities of the tractor. The same is true in regard to all machinery. More machinery means greater production and cheaper labor. It is by machinery that we must solve the help problem.

The classes for live stock have been made more attractive for the small breeder of the state in that greater opportunities are given him to win ribbons. The Wisconsin competitions have been added to eliminate the chances of the professional showman gathering in all the prize money. Open competitions have, however, been made attractive enough so that outside breeders will find it worth their while to exhibit at Wisconsin. The judges for all classes of live stock have been selected with a view to making ribbons at the Wisconsin fair something particularly desirable. All judges are chosen on their merits alone.

The automobile show will be the largest of its kind in the country. There will be 52,000 square feet of floor space given over to new machines and an equal amount of space for used cars.

The old creek which runs through the section where the sheep and swine barns stand now flows through a concrete flume and the ground has been filled in so that it is now dry instead of a mire. The race track has also been drained.

There will be space for 20,000 automobiles on the grounds, which can be parked free of charge.

The racing events promise to be especially good. Four days will be given over to horse racing and two days to auto racing. Two big stakes of $5,000 each have been guaranteed by the Milwaukee Chamber of Commerce and the Plankington Hotel.

There will be a boys' and girls' camp again under the direction of Professor Bewick, of the University of Wisconsin. A pageant showing the advance of agriculture in Wisconsin is planned for this year which will be presented entirely by the boys and girls. The thousands of children, led by the boys' and girls' department, will sing "The Star Spangled Banner" on Children's Day, September 10th.

In character of entertainments Wisconsin has led all other fairs. Wisconsin was among the first to do away with all questionable entertainments and the amusements this year will be more than ever free from objectionable "acts." Aeroplane flights and fireworks are the biggest of the twenty acts which will be given each night.

The educational side of this year's fair, however, is going to be the one big thing. The finest cattle (beef and dairy), hogs, horses, sheep and poultry, together with canning and fruit exhibits, will make the fair supreme in live stock. The tractor and machinery exhibits and demonstrations will make it likewise supreme industrially.

Every department headed by an expert in that particular work is the secret of the fair's growth in every branch. The entire responsibility, however, actually rests on Secretary Remey and Commissioner of Agriculture Norgord. But if sincerity plus ability plus work will accomplish anything, then Wisconsin will take a long step forward this year to soon being able to say that we have the best fair of any state in the Union.

Clearing With a Tractor.

To the Editor:—I can honestly say that from my own experience I think the tractor the most efficient and economical machine yet invented for putting our lands under cultivation.

We had three men running our 12-25 tractor and they pulled the stumps and broke up about twenty acres of land in less than two weeks. We are using a twenty-eight-inch breaking plow and cutting a twenty-four-inch furrow to the depth of seven inches. We turned under all the average grubs and most of the small stumps, while the trees and larger stumps we pulled with the tractor before we started plowing. All our neighbors state that it is the finest piece of breaking they have ever seen.

We figure that we made a saving of $5 to $6 an acre and besides did a much better job.

Although we have not had any repairs on our tractor this season, I must confess that pulling stumps is hard on the tractor on account of the temptation to overload it, and most operators get more or less careless when the day is nearly over and have a tendency to jerk the tractor, but this is by no means the fault of the machine.

For my part I think that the tractor is so far ahead of horses that there is no comparison. I plowed about forty acres this spring on sixty gallons of gas and twenty gallons of kerosene and about four gallons of oil.

I would recommend a small tractor, not larger than 10-20, on a 160-acre farm, while a larger farm ought to make good use of a 12-25 or an 18-36. Of course, it must be taken into consideration that there is some work that cannot be done with a tractor, such as tilling or breaking steep hillsides, hauling produce to market (that is, in this locality), and numerous other things. Horses cannot be entirely dispensed with on a farm, but we have plenty of work for four horses on 250 acres of cultivated land besides the work that we do with the tractor. Anton Omernils.

Burnett Co., Wisconsin.

Detecting Ticks in the Flock.

When sheep are heavily infested with ticks they bite and scratch and rub against any available object, including other members of the flock. The natural position of the wool is disturbed by these efforts to obtain relief from the intense itching; more or less wool is pulled out, and the fleece may have a ragged appearance.

If sheep ticks are causing the trouble, they may be found by parting the wool over the neck, breast, shoulders, belly and thighs. They are large enough to be seen readily and are of a brownish color. On warm days they often may be observed crawling over the tips of the wool. If ticks are present pupae usually will be found attached to the wool fibers. These are seen easily with the naked eye, being about one-eighth of an inch in length. Their color varies from yellowish white to dark brown, and the shell is glossy and firm.

Any condition which causes the sheep to bite and scratch themselves may be mistaken temporarily for ticks. In every instance close examination should be made and the cause definitely learned. It should be remembered, however, that the presence of ticks does not exclude other possible causes of the irritation, such as scab, lice, common ticks, bearded seeds, thorns, etc.—[Bulletin.

17 YEARS Of Experience Behind This TRACTOR

New Simplicity kerosene engine with throttling governor. Smooth running; instantly changes to gasoline or kerosene. Special carburetor means perfect combustion.

Simplicity Blower-Cutter—cuts fast, delivers maximum amount of silage per horse-power. Substantially built, safe, durable.

HERE'S a tractor that will give you good, downright, honest service. It has stood every tractor test, working under all conditions of soil. It has proved itself a tractor of merit—and our reputation of 17 years' standing is back of every tractor we put out.

TURNER Simplicity TRACTORS

are all-around tractors, practical for the average sized farm. They will do your plowing, discing and harvesting; also your hauling and belt work. Powerful enough for the heavy jobs; light enough to handle the small jobs economically.

Simple control, easy to handle. Practically all working parts enclosed. Equipped for kerosene or gasoline. Waukesha Tractor Motor, Hyatt Roller Bearings—standard design throughout.

Tear out this ad, write your name and address on the margin and mail for descriptive literature. Mark a cross under the Simplicity engine and Feed Cutter if interested in these products.

TURNER MFG. CO., 101 Lake Street, Port Washington, Wis.

Running Water on the Farm.

Farmers Can Ill Afford to Do Without This Convenience—By Louis W. Bridgman, of the Wisconsin State Board of Health Dept.

RURAL life has already attained many of the luxuries and conveniences of the urban dweller. The telephone, the automobile, rural free mail delivery, and musical instruments are some of the farmer's modern day possessions. But the utility most essential to the health, convenience, protection and general well being of the farm home is none of these, but may be made an adjunct of such homes. We refer to a home water supply system. These private plants have been so well developed that a rural home may be as comfortably served and protected as any city home having the advantage of waterworks. What this means for the economic freedom of the farm housewife is not difficult to understand; what it may mean as an encouragement for the young folks to remain on the farm is also a factor not to be lightly regarded. It means at once an end of the worst of kitchen drudgery, and a time—and labor saver around the barn and dairy. Hot and cold running water can be had in any farm home in Wisconsin by the expenditure of a reasonable amount for equipment.

What is here to be described is entirely independent of any other water systems; the source of supply is from either the dug well, drilled well, spring, stream or lake, whichever is best suited to the purpose. The machinery consists, briefly, of a steel storage tank, stationed in the basement, or underground, or in any other suitable place, protected from the weather; a pump for installation in the water sources; an electrical connection, gasoline engine, or windmill pump, and necessary fixtures, appliances and piping for conveying the water to the various faucets throughout the home and farm buildings. For the average farm, where electrical connection is not available, gasoline or similar power is preferred, especially because it can be used for a multitude of power purposes, such as running the grindstone, feed mill, washing machine, woodsaws, corn shellers, cream separators, churns, vacuum cleaners, etc.

CROSS SECTION OF MODERN FARM PLACE SUPPLIED WITH HOT AND COLD RUNNING WATER.

The principle of the elevated tank was the forcing of water through the house by pressure from above. The basement tank comprehends forcing the water upwards to all parts of the house and to other farm buildings by means of compressed air. Omitting technical details, this system may be briefly described as follows:

The pump is set in the well. It is connected by supply pipes with the air-tight tank located in the basement. The motor or engine operates the pump, which forces water into the tank through an opening in the bottom. With no outlet at the top, the air already in the tank is compressed from the force of the water entering from below, or by the medium of an air compressor equipment. This pressure forces the water through the outlet pipes connected to the bottom of the tank and leading to the various faucets, the kitchen sink, bathroom, washbowls, etc., in the house, and to the outside fixtures where water is used for the usual farm duties. When the tank gets half full, all the air which, before water entered, filled the tank, is compressed into the upper half, and a pressure of fifteen pounds to the square inch may be formed. Such a force is able to send water through pipes to a height of nearly thirty-five feet. The air remains in the tank and is compressed when more water is pumped in, and expands downward, pushing the water before it, when the water is drawn off. To be able to pump water to the second floor, the tank should be pumped one-third full of water. If still fuller, the supply available on that floor will be practically unlimited.

Electric power, when available in adequate voltage, is desirable because of its ease of application and relatively low expense. The original cost of this power is, of course, smaller than gasoline power. The motor is usually so installed that it starts automatically when more air storage is needed and stops when the necessary pressure has been obtained. The only attendance required is occasional lubrication and cleaning. A motor with over one horse power will do the pumping for the average farm.

A windmill pump can be made to work satisfactorily if the proper installation is made. This method is, of course, the most inexpensive. Its chief defect is found in the inconstant supply due to lack of winds. Such a pump serves very well if two cylinders are used—one to lift the water from the well and the other to force it into the storage tank.

Gasoline or similar power, which probably is best adapted for most farms, can be used as low as one horsepower and can be located anywhere on the premises—in the basement, garage, barn or other suitable building. It is necessary to run the engine only a short time daily to lift all the water needed about the farm. One engine can be used to pump water and generate electricity at the same time, if a private electrical plant is installed in the home.

There is no longer excuse, outside of absolute lack of capital, for the average farm home being without running water and the fire protection which goes with it. This facility revolutionizes conditions for the farm housewife. It is the constant pumping and carrying of water that makes farm housework hard. It is usually the woman's part to do this work. Then the water must be heated over a fire, with time and expense other adverse factors. These difficult working conditions may not always affect women unfavorably, but their usual tendency is to impair their health and lower their resistance to disease. The convenience of a running water system for all the family should in itself commend the plan. There is nothing more desirable than modern devices for cleanliness, such as baths, lavatories and laundries in every home. Bathtubs and lavatories are modern essentials in the public health movement. Where these are lacking the natural tendency is to neglect personal ablutions, and sanitary science has demonstrated that this neglect often spells illness and loss of vitality, and predisposes to fatal disease. Bathing in sanitary bathtubs with hot and cold water always on tap is likely to become a fixed habit, not a distasteful and deferred duty, and easily grows into a pleasure which increases with the force of the habit. A clean body conduces to clean living.

Running water is fully as great a boon to the farmer and his help around the barns and dairy as to the women folks in the home. Fresh water can be pumped to faucets placed at the most convenient places for their use. A system of the kind described enables the farmer to give his stock water heated to just the right temperature. Freezing cold water offered to cows has the wrong effect on their digestive workings, chilling the stomach and interfering with the proper flow of the digestive juices. Stock must have plenty of water to produce fat and milk, and there is a happy medium in the quality of the water supplied them. Water warmed to the right temperature will pay good dividends in increased contentment on the part of the cows, thus conducing to better production. To the farm hand who must water the stock, horses, pigs and chickens, the use of running water should mean much. The farm chores lose much of their disagreeableness when pumping and carrying water from the well are done away with. Stables and pens can be flushed daily; wagons, buggies and automobiles washed with the hose, and an abundant supply of water provided for cleansing the cans and pans in the dairy house.

A farm water supply having an adequate pressure is a most valuable advantage on any farm as a protection against fire. Because of their isolation from city fire protection, rural homes are more likely than not to be destroyed if fire gets a fair start. It is one of the marked points of a farm water system to be able to increase the pressure in emergencies to throw a powerful stream. One faucet constantly connected with a fire hose will serve as an efficient fire protection at all times, and is an inducement towards lower insurance premiums. A full supply of water is always at hand, and the system assures a constant good pressure.

Any system of running water requires that the buildings be properly heated in order to avoid freezing of the pipes in cold weather, and that the engine may do its work under proper conditions as regards temperature, freedom from frost, and other factors. Therefore, a house warmed by furnace heat or some system of air or water heating is much preferred over stove heat. The former is not essential, however, if due attention is paid to adequate heating by stoves.

FARMERS' MARKET

Wanted—For Sale—To Exchange

THIS department is to bring the buyer and the seller together. You may have live stock, poultry and eggs or machinery for sale. You may want to sell or buy a farm. Write your copy for the advertisement. The rate is six cents per word, each insertion.

The Wisconsin Farmer, Madison, Wis.

FARM LANDS.

SILENT PARTNER WANTED—We have a fine chance to buy fine farms close to the city of Oconto, Wis., suitable for stock farms, that would feed over a thousand head of cattle, at a very low price on account of old age and death of owners. There are over 100 head of thoroughbreds on them now that would go with the farm. There is big money for the party that would furnish the money to swing the deal. Address C. S. Hart, Oconto, Wisconsin.

FOR SALE—Two improved eighties, adjoining Missouri river, on beautiful flat south of bridge at Mobridge, S. D. Price per acre, $125. FOR SALE—Improved Wisconsin farm, 138 plus acres, adjoining beautiful lake. About seven miles from Danbury or Webster. Price $40 per acre. Will accept farm in north river section of South Dakota for equity. M. T. Woods, Mobridge, S. D.

HARDWOOD cut-over land, silt loam, clay subsoil. Not sandy or gravelly. Close to towns. Good roads. In the heart of the dairy country. You deal direct with the owners. No agents and no commissions. Easy terms. Write for map and booklet 9. North Western Lumber Company, Land Department, Stanley, Wis.

SQUARE QUARTER, Red River Valley land, all under cultivation, buildings little value, three miles from two good railroad market towns. Best quality soil, well drained, no waste land; excellent neighborhood. $45 per acre for quick sale, easy terms, 6 per cent, no trades. C. L. Lindstrom, Grand Forks, N. D.

FARM FOR SALE—Within five miles of a village of fifteen hundred inhabitants. Fifteen acres cleared. $2500 worth of saw log timber. Price right, and terms reasonable. Write Healy-Brown Co., Wausau, Wis.

340 ACRES FOR RENT—Mile from town, fine chance for a good stock man. I will help stock it. Have a smaller farm I will sell to right man on easy terms. M. A. Peoples, Ladysmith, Wis.

WOULD YOU SELL YOUR FARM if you got your price? Sell direct. No commissions. Particulars free. Charles Renich, G-2, Woodstock, Illinois.

FOR SALE—80 acres best timber land, Clark county. Inquire John Nicholson, Coal City, Ill.

HELP WANTED.

WANTED AT ONCE—Three men to work on poultry farm. Must thoroughly understand either incubation and brooding, feeding or health and sanitation. Are willing to pay good wages to the right man. Address Oak Dale Farm, Austin, Minn.

MONEY TO LOAN.

MONEY TO LOAN on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage 6% with privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

CALVES FOR SALE.

CHOICE HIGH-GRADE Holsteins, Guernseys and Short-horn calves. A few select ones at $15 to $35 each, expressed at little cost. Write Ed Howey Co., South St. Paul, Minn.

MILKING MACHINE FOR SALE.

FOR SALE—Milking machine. Two-cow unit. Automatic vacuum and natural air pressure type. In first-class condition. Address G. G. Daugherty, 33 S. Stone Ave., LaGrange, Ill.

ALFALFA SEED.

ALFALFA SEED—$8.00 per bushel. Good purity and germination but dark color. Better grades for more money. Write for samples and prices. Henry Field, Shenandoah, Iowa.

ALFALFA SEED—Nearly 100% pure, $8.75 bu. Alfalfa book free. Samples mailed. Timothy, $3.50. Rape, 14c lb. Fall turnips, 75c. Johnson Bros., Nebraska City, Nebraska.

HONEY.

HONEY—Pure extracted honey. Better and cheaper than butter or sauce. Price list on application. M. E. Bares, Stanton —, Eau Claire, Wis.

HOLSTEIN COW.

REGISTERED HOLSTEIN COW, defective udder, richest breeding, bred to a 44-lb. butter sire, $150. R. M. Hartman, Appleton, Wis.

BELGIAN HARES.

EARN $20 WEEKLY raising Belgian hares. Pa[illegible] 10c. Ulysses Anderson, 2421 Orden, D[illegible], Colorado.

TELEGRAPHY.

LEARN TELEGRAPHY—Positions guaranteed. [illegible] Telegraph School, Eau Claire, Wis.

Special! Want a Man in Every County to represent me

THE SIMPLEX

EVERLASTING concrete post, the only fence post ever made that the wire can be put on and taken off at will. Nothing to break or rust and will last forever. Answer at once as I only have one man to a county. Let me help you in business. Reference required. J. S. GIBSON, Mfr. & Patentee, 2323 W. 35th Place, Chicago, Ill.

ENGRAVING Halftones made from pictures or drawings of stock for your letterheads, post cards, catalog advertising. Quick service, best work, reasonable prices. Write for information.

Engraving Dept. Des Moines, Iowa

FARM MECHANICS

Questions and Answers.

Lubrication of Motors.

Do you recommend the use of graphite with the engine oil of an automobile?

Answer.—We do not. Graphite is an excellent lubricant for steam engine work, but not for an auto engine. The high heat in the combustion chamber may cake the graphite around the piston rings and cause them to stick. It may also clog the small oil passages through the crank shaft and bearings.

Arc Lights.

Please answer the following question through the Farm Mechanics department: Will a generator capable of lighting thirteen seventeen-candle-power twenty-watt lamps be strong enough to operate an arc lamp? It is a ¼ K. W. generator.

Answer.—Your generator is only half large enough to operate an ordinary arc light. Four hundred to 500 watts are required; 200 to 350 candle power is produced. The arc light is wasteful of power.

Size of Pulleys.

Please tell me in your Farm Mechanics department how large pulleys I will need to reduce the speed of 550 R. P. M. at my engine to 55 R. P. M. at my separator, using a jackshaft. The pulley on the engine is six inches in diameter and the pulley on the separator is fourteen inches in diameter. The speed of the jackshaft is immaterial.

Answer.—The pulley on the jackshaft driven by a belt from the engine pulley should be four and two-sevenths times as large as the pulley on the jackshaft that is belted to the separator. For example, a thirty-inch pulley and a seven-inch pulley may be used on the jackshaft, the thirty-inch pulley being belted to the engine and the seven-inch pulley to the separator.

Tractor Gearing.

I have a forty-horse-power motor. I would like to make a tractor with it. I am going to cut off the propellor tube of an auto and set the differential up to the transmission, using the rear axle as a jackshaft. I intend to use binder wheels for drivers. I am using the sprocket wheels of a manure spreader. The small sprocket has eighteen teeth and the large one fifty-four teeth. How many plows would the outfit pull, and what would be its speed if the engine runs at 900 R. P. M.? If this does not gear the tractor correctly, what size sprockets should I use?

Answer.—This gearing would give over seven miles per hour on high. This is twice as fast as it should travel. A better ratio for your sprockets would be fifteen teeth and ninety teeth. The tractor should pull three fourteen-inch plows under any reasonable condition. The binder wheels are rather small for the drivers and this would probably be the limiting feature of the pulling power of the outfit.

Dimming Auto Lights.

Would a piece of colored celluloid be all right to use in auto headlights for dimmers? Would it be all right to take a round piece and cut in two putting half in each light? Would that do as well as having the glasses ground? Could I use that by law?

Answer.—Dimmer and speed regulations are usually local ordinances; therefore, a dimmer that would be satisfactory in one city might not be considered sufficient in another. We believe that the method you have mentioned would be considered satisfactory. The half circles of celluloid must be so placed that the bright light will shine on the ground. A medium shade of brown should give good results. A round piece of brown celluloid about two and one-half inches in diameter located at the center of the glass might be all right. Whiting, mixed with water or gasoline, is often used to frost the glass so that the lights will not be too bright. This is an inexpensive and satisfactory method of dimming.

Not Enough Dry Cells.

I have two electric lights on my buggy, which I wired myself, as per sketch. I use two-candle-power six to eight-volt Mazda bulbs, and run them with five dry cells connected in series. They don't seem to give a bright light when both of the bulbs are burning, but when I short circuit the wires on one light the other gives a good light. If they are wired wrong, please publish a sketch showing how to wire them. If not, how can I make them give a better light?

Answer.—The sketch, which we are not publishing for lack of space, shows the batteries and lamps connected in series. This wiring would be O. K. if you use ten dry cells in series instead of five. Using only five dry cells, you should connect the cells in series and the lights in parallel. To do this, ground one terminal of the battery and run a wire from the other terminal to both of the lights, grounding one terminal of each light. Place the switch in the line leading from the battery to the ground. A still better combination would be to use ten dry cells, connected in series multiple, five in a series, the lights being connected in parallel.

A Small Tractor.

I am sending a sketch showing the pulling mechanism of a small tractor. The engine to be mounted on this frame is four horse power. I believe the mechanical parts shown will work all right, but I would like to know how to make some device for the rear shaft or rear sprocket for turning corners, as the outer wheel has a greater distance to travel than the inside wheel. I would like for you to publish a sketch showing how to make this part.

Answer.—Figure I shows the arrangement of the above tractor. C is the engine crank shaft, A the drive pulley on the engine, B the pulley on the jackshaft driven from A; SS are small sprockets on the jackshaft and LL are large sprockets. The device for starting and stopping is not shown. If pulleys A and B have flanges the

FIGURE 1.

belt could be laced loose enough to slip and a belt tightener used to start and stop the machine. No provision is made for backing, which probably would not be necessary with a small machine like this.

To permit one wheel to travel faster than the other when turning corners, attach a ratchet to the hub of each drive wheel, as shown in Figure 2 at R. The sprocket, S, must be mounted

FIGURE 2.

on a long hub free to turn on the rear axle, which must be stationary. The sprocket is mounted on this hub by bolts through the holes marked B. Two ratchet pawls, P P, held in place by springs, act as drivers when the pull is on the sprocket. When rounding a corner the driving is done by the inside wheel, the ratchet permitting the outside wheel to move faster. It would be impossible to back the machine with this arrangement.

A Jet Pump.

I would like a little information on the construction of a jet pump. I would also like to know if it will draw water about seventy feet with an eight-foot lift. I saw the cut of one in the Farm Mechanics department some time ago, but I have mislaid it. Any information you can give me will be appreciated. My boiler carries 100 pounds of steam pressure and has three-fourths-inch pipe connections.

Answer.—The jet pump or ejector, as it is often called, works on the principle of an atomizer. A small jet of steam is blown into a pipe. The jet creates a suction back of it. The jet pump, with steam at 100 pounds pressure, will lift water twenty-four feet. If the pump is placed near the water level it would raise the water seventy feet. Under the conditions mentioned in the above letter a pump with three-fourths-inch pipe connection should pump over 1,200 gallons per hour; with a half-inch connection it would pump over 600 gallons per hour. The pump should not cost over $4 and your local hardware dealer should be able to order one for you. If not, write us again.

Carbon Prevention—Gasoline Economy.

What is the best preparation to put into an automobile engine to prevent carbon from forming? What make of car of the same horse power uses the least gasoline per mile?

Answer.—The best carbon preventive is a good set of piston rings and a proper regulation of the oil supply. Carbon is usually caused by the oil working up past the rings. This may be due to poor rings; too high an oil level in the crank case, where the splash system is used, or too much pressure and poor-fitting bearings where forced feed is used. Carbon may also be due to too rich a gasoline mixture. In any case, an ounce of prevention is worth a pound of cure. There are some compounds on the market that claim to prevent carbon if used with the gasoline, but we have never tried them.

It would be impossible to say which car has the best fuel economy on account of the different weights and horse powers of the cars. Much depends upon the adjustment of the carburetor, the timing of the spark and the judgment used by the driver in controlling his spark and throttle.

Using Kerosene and Gasoline.

Is it practical to use a mixture of kerosene and gasoline in a one-horse-power gasoline engine? Can the mixture be used in a Ford car?

Answer.—Many small engines will work successfully on kerosene or a mixture of kerosene and gasoline after the engine has been run long enough to become hot. The fuel should be heated by running it in a coil of copper pipe around the exhaust pipe or through the jacket water, the latter to be preferred. The temperature of the kerosene should be between 170 and 200 degrees. The air should be heated, the usual method being to carry it from a sheet iron jacket around the exhaust pipe to the carburetor by a flexible metal hose. If the engine pounds from preignition, arrangements should be made to allow a little water to drip inside the sheet iron jacket on the exhaust pipe. The steam will be carried in through the air.

The oil in the crank case must be watched, as unburned kerosene may work down into the crank case and ruin the oil, causing the bearings to burn out. There are some carburetors on the market that claim to burn kerosene successfully in Ford cars. We would not advise you to try burning kerosene or even a kerosene-gasoline mixture in your car without a special carburetor.

"DELCO-LIGHT works for me every day in the year, furnishing electric light and power."

"When I want light I just press a button. There are no lanterns to carry. There are no lamps to clean.

"I have running water in the house and barnyard, pumped by electricity. The churn, cream separator and washing machine are run by a small electric motor.

"The entire family is delighted. And what appeals to me is the fact that Delco-Light is rapidly paying for itself in time and labor saved." *Jacob Stine, R. R. 4, Lewisburg, O.*

Thirty thousand other users are finding Delco-Light to be a good investment.

Teaching the Child by Example.

Little children invariably copy the sights and sounds about them. Thus their earliest education is acquired not by precept or teaching but by unconscious imitation of those with whom they live. The child, even before he learns to talk, is quick to notice and imitate the manners and behavior of those about him. Likewise, when he begins to talk he picks up words and phrases used by his elders and copies their manner of speech.

It is easy to see, therefore, the effect of one's own conduct upon that of the child. If the language of those among whom a child lives is correct and agreeable, if their manners are pleasant, if they exhibit a thoughtful consideration for others and a gentle and kindly behavior, he unconsciously acquires similar ways. The habit of courtesy comes not alone nor chiefly from direct instruction, but from imitation. If a child sees that his elders are habitually courteous in their association with each other, if kindliness and consideration for each other are the habits of the home, these qualities will inevitably stamp themselves upon the child. Good manners are an invaluable asset to every person, but good manners have their root and foundation in fine qualities of mind and heart, and only the constant daily exercise of them will help give the child that charm of manner which is such a delight in persons of every age. In like manner the opposite qualities are imitated and help to produce a different sort of child.

Parents have a great responsibility in molding and shaping a child's character. These early lessons in conduct and manners are never quite eradicated and it is the parents who play the greatest part in the teaching of these lessons. Men who as children were accustomed to hearing uncouth language will even in manhood lapse into this fault, no matter how well educated they may have become, and the same is true of physical mannerisms and even of the mental attitude. If a child hears nothing but scolding, faultfinding, complaining and quarreling he is almost sure to develop these qualities in himself. On the other hand, if he lives in an atmosphere of kindliness and courtesy he will as readily acquire gentle habits and a pleasant manner. It is the duty of parents, then, to "live" as well as teach the fine qualities they wish to develop in their children.

Waste no Fat-Suggestions for its Utilization.

At this time when all kinds of fats cost so much, it behooves the thrifty housewife to utilize every bit that comes into the kitchen.

The fat from mutton or lamb may be used in making soap, or in making tallow that is good for chapped hands.

Goose grease is an old-time remedy for sore throats.

Chicken fat, rendered, makes an excellent cooking fat. It is especially good for biscuits, cornbread, muffins or spice cakes.

Beef fat or suet is much cheaper than lard and can, in most cases, be substituted for it.

Any fat from pork can be rendered and used in cooking. When trimming meat at home, save all fat and render it. If the meat is trimmed at the market, insist on having the trimmings delivered with the meat.

The unrendered rind that is cut from meat makes an excellent grease for griddles, skillets or other pans. When cooking bacon, pour off the excess fat and save it. It is very good for browning potatoes or parsnips.

The cracklings that remain when fat is rendered may be used in soap, corn breads, spice cake or for chicken feed.

Any butter that is not fresh may be worked over with cold water and greatly improved.

Rancid olive oil can be freshened by heating with a few slices of potato. —[Magdelene Hahn.

Let Nothing Spoil.

Heat, dirt, improper handling, flies, insects and rats or mice are the greatest food wasters.

Keep perishables cool, clean and covered. The moment meat, fish, milk and eggs are allowed to get warm they begin to spoil. Bacteria and germs multiply rapidly in slightly warm food and quickly make it dangerous or unfit to eat.

Keep perishable foods in the coolest, cleanest place you can provide, preferably in a good refrigerator or ice house, but, at any rate, in covered vessels suspended in the well, or in the coolest clean place in your home or cellar. Do not keep perishable foods in a hot kitchen or pantry or in a sunny place a moment longer than is necessary. Dry cold is a better preservative than damp cold.

The dust particles in the air carry molds and germs. Meat, fish and milk are ideal breeding grounds for such germs. Keep your food covered so that these bacteria and germs will have as little chance as possible to get on your food.

House flies—better called "typhoid flies"—are among the dirtiest things that enter our homes. They fly from sewers, privies and manure heaps, carrying filth on their feet, which they deposit on any food on which they light. Frequently germs of typhoid fever are carried by flies in the filth on their bodies, and in their excrement (fly specks). Ordinarily cleanliness demands that flies be kept out of our homes and away from our food. Health protection makes it essential to banish flies. Keep all food covered, or at least screened from these carriers of deadly disease and filth. Destroy flies by every possible means.

Rats and mice destroy millions of dollars' worth of food and other property every year in homes, on farms and in business establishments. Many rats harbor the germs of bubonic plague. Trap and kill them. Look upon every mouse as an enemy to your property.

Eradicate roaches and house ants. Keep weevils out of cereals. Keep your food where such pests cannot reach it.

Keep household pets away from food.

Don't let fresh vegetables or fruits wilt or lose their flavor or begin to rot because they are handled carelessly. Keep perishable vegetables in cool, dry, well-aired, and for most vegetables, dark rather than light places. Learn how to store potatoes, cabbages, root crops, fruits and other foods so that they will keep properly for later use. Don't think that any place in the cellar or pantry is good enough to store food. Heat, dampness, poor ventilation, bruising or breaking will rapidly make many vegetables rot, ferment or spoil. Warmth and light make vegetables sprout and this lowers their quality.

When there is a surplus of fruits or vegetables that will spoil if kept, cook or stew them and keep them cold and covered for use in a day or two. Can or preserve all surplus food from gardens for winter use. In a morning's work, with ordinary home utensils, you can put up many cans of vegetables and fruit for winter use. When any fruit or vegetable that can be canned becomes plentiful can it for home use next winter.

Write today to the United States Department of Agriculture or to your state agricultural college for full information as to how to keep food in the household and how to can and preserve all surplus fruits and vegetables.

Make saving, rather than spending, your social standard.

Puts up Beans Like Kraut.

To the Editor:—I read the letter from the lady who wanted to know how to put up string beans like kraut. I put them up in this way: I wash them well, string them and then cut real fine, cutting lengthwise. Then I put them in jars and proceed as in making kraut. Do not get them too salty.

When I want to use them I wash them well and put them on to cook in cold water. They are fine in vegetable soup and we also like them cooked with milk. A Reader.

Wants Some Advice About Cooking.

To the Editor:—I wish some of the good cooks who read the Home page would tell me how they cook green string beans and cabbage. We like both of these vegetables, but get tired of the same old way of cooking them. Also I would like to know how to roast an old hen so that the meat will not all dry up. I never have any luck with them. One more thing I want, and that is a good recipe for bread dumplings. Can someone give me one of their good tried recipes? Mrs. H. L.

Here Is a Real Mother.

To the Editor:—I want to write a few lines to help little Vesta, whose letter appeared in a recent issue.

Dear little Vesta, have you not some good neighbor woman who will help you about your dresses? God bless you, dear child. Don't think of your dear mother as being dead, but think of her as I do of my mother who went away twenty long years ago. I just feel as though she has gone away to her good home and, while we are very lonely, let us be good and do all the good we can to all the people we can, then all will be all right in the end.

If I were where I could, I am sure I would try to help you some about your sewing and I would make the dresses in length to come about half way between the knees and shoetops.

I think it is all right for you to go to good, wholesome entertainments as long as your brother goes along. But I would go to church and Sunday school.

Now let me tell you about myself, dear little Vesta. I am a married woman and one of those despised stepmothers. I have been married twenty-one years. I helped my husband to raise one little boy that was left without a mother just as you were. I loved him and tried to be as near a real mother to him as I could be, and now he is a married man with two little boys of his own and I still love him. There never was a night too cold or too dark that I would not make an effort to go to him if he needed assistance. I shall always have a warm place in my affections for him, for he is a dear, good boy.

Then fourteen years ago last April one of my sisters was laid away. She left one little boy twenty months old and it fell to my lot to care for him. I did so with the help of my good husband, and we have him with us yet.

One year ago another of my sisters was called away to the good home and left a little boy twenty-six months old. So it was my lot again to take him and he is also with us now. His papa joined the army and we shall care for him just as though he were our very own.

So you see, little Vesta, my heart goes out to you and to all little orphan children. I never hear of one or read of one being left that I do not wish I could help them in some way. I do not boast of anything I have done in the way of caring for the dear little children that I have had with me, for I just feel that when I have done all that I can do I have only done my duty. I have no children of my own, but I love all the dear little folks.

A Friend.

Recipes.

Spoon Cornbread.—One cupful white corn meal, two cupfuls boiling water, one tablespoonful butter, one teaspoonful baking powder, one teaspoonful salt, one egg yolk well beaten, one-half cupful cooked hominy, one-third cupful cooked rice, one cupful milk, one egg white. Add corn meal gradually to boiling water, boil five minutes, add butter and let stand until cool. Add baking powder, salt, egg yolk, cooked hominy and rice, and milk. Beat two minutes, then add stiffly beaten egg white. Turn into a buttered pudding dish and bake in a hot oven forty minutes.

Peanut Butter Cookies. — Three-eighths cupful peanut butter, one-half cupful sugar, one egg well beaten, three-fourths cupful flour, one-fourth teaspoonful salt, three-eighths teaspoonful cinnamon, three-eighths teaspoonful soda. Work peanut butter until creamy, add sugar gradually, egg, soda dissolved in three-fourths tablespoonful hot water and dry ingredients. Chill, roll thin, shape, arrange on buttered sheet and bake in moderate oven.

Lemon Egg Nog.—Beat an egg yolk until it is lemon colored and thick. Then add a teaspoonful of sugar gradually and follow with the stiffly beaten white of the egg. Add a tablespoonful of lemon juice and serve while cold.

Pimento Salad.—One quart stewed tomatoes or tomato juice, one slice onion, one teaspoonful salt, four whole cloves, one teaspoonful sugar, pinch of thyme, two tablespoonfuls gelatin, one-half cupful water, one cupful chopped pimentos. Boil tomato and seasonings together for ten minutes. Soak gelatin in the cold water for five minutes, add to tomato mixture and when gelatin is dissolved, strain. When it begins to thicken add the pimentos. Turn into a mold, first dipped in cold water, and chill. Serve on water cress and garnish with pimento olives.

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

Tom Gets a Fright.

Dear Young Folks:—I am a girl twelve years old. I live in a little town named Broken Bow. I have lots of fun. We have a picnic nearly every Saturday and our B. Y. P. U. has a party every other Saturday.

I have a pet cat named Tom. One time he got on the table. Mama's teapot was on the table and Tom knocked it off and broke it. Mama whipped him and he ran off and never did come back until one day I found him up town. I brought him home and fed him and he never got on the table again. Ethel.

Wants to Be Kind to Vesta.

Dear Young Folks:—I hurry to the mail box every Thursday in order to get the paper. I always read the letters you write. I am twelve years old. I am in the seventh grade and I like school very much. I have written twice before, but I suppose my letters were failures.

In one paper there was a very interesting letter signed "Vesta." I thought I would like to do Vesta a kindness and tell her the things she wants to know. Mother said she would judge Vesta by me. If she is

around four feet, nine inches tall she should wear her dresses two or two and one-half inches below her knees. And mother doesn't think it would hurt for Vesta to go to a few parties with her brother, but she thinks she is most too young to go to a great many. Mother thinks she must be pretty smart to do all her sewing.

I have a pet pony named Bobby. He is black and white. I ride him to school. He is very gentle.

I take music lessons and like it very much.

We live on a 160-acre farm. I would not give up country life for city life.

I hope Vesta takes to mother's plan.

Blanche.

Metta and the Prince.

Dear Young Folks:—I am a girl twelve years old and in the seventh grade at school. I like the story of Metta and the Prince and I want to tell it to you.

Metta lived with her grandmother and they were very poor. One morning Metta started to market with a basketful of eggs and she felt something pulling at her skirt. She turned around and saw a queer little man.

"Good morning, Metta," he said. "I am in trouble and want you to help me." Of course, Metta said she would and he told her what to do.

"Go to the stump where the rosebush grows, sit down and cover me with your apron. Don't get up until I pull your dress." Metta did exactly as he said and tucked her apron around him so that he was completely hidden.

No sooner was he out of sight than an old witch came around the bend of the road. She had a long nose and sharp eyes and she wore a tall hat and carried a big staff.

She stopped beside Metta and said, "Get up, girl, and let me by," but Metta had promised the queer little man not to move and she meant to keep her promise, so she kept quite still.

This made the witch very angry, so she took the basket of eggs and tramped on them. Still Metta never moved and the witch was so cross that she gave a dreadful howl and turned and ran away.

Then Metta felt a tug at her skirt and the little man stepped out and said, "You have done my master a great favor. I can tell you nothing more, but come again tomorrow at the same time." Metta promised to come again and he disappeared.

Metta was a little frightened about her eggs, but she gathered up the basket and went home and when she handed it to her grandmother she was surprised to find it filled with gold pieces, so, after all, there was not the least thing to worry about.

The next day she started again as she had promised, and the very same thing happened and the witch was so angry this time that she raised her staff to beat Metta, but still Metta was not afraid. Again the old witch ran away as fast as she could go.

As soon as the witch was gone Metta heard a noise and when she looked behind her where the rosebush grew she saw a handsome prince. He took her hand and said, "Metta, that old witch cast a spell over me three years ago and you have broken the charm. Every day for two years she came to sprinkle me with ashes to keep me under her spell. This was the last year and if she had succeeded in throwing the ashes over me today I never could have returned to the world again, but would always have remained a rosebush."

Then Metta and the prince went to the grandmother's house and they were married and lived very happily.

Emma.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for July 29, 1917.

God's Gracious Invitation.

LESSON TEXT—Isaiah 55:1-11.

GOLDEN TEXT—Seek ye the Lord while he may be found, call ye upon him while he is near.—Isa. 55:6.

The Bible is throughout a forward looking book. No matter how dark the light, it looks forward to the dawn of a new and better day. Whenever written, the prophet looks forward toward the end of the Babylonian exile. Isaiah died about 142 years before that event. That scene is laid in Babylonia. Isaiah prophesied in Jerusalem.

I. The Invitation, (vv. 1-8) In order to understand the fullness and blessedness of this invitation, we should read in its connection chapters 53 and 54. In chapter 53 we have a prophecy and vision of the Messiah, making his atonement for sins, "wounded for our transgressions." Again we have in this connection a picture of the Messiah as our leader and Savior. In chapter 55 we have the invitation and joyous welcome to the beautiful city which he is establishing for us.

(1) Who is Invited? The word "Ho" is perhaps an abbreviation of the word "Hold," used to excite attention. This invitation is extended to every one: (a) the "thirsty," to those who are needy; (b) the poor and the rich; those "without money," and the supply is abundant, even as the water. Every one is invited without limitation or distinction. The greatness of a man's spirit is measured by the number of his desires and thirsts, by their qualities and by his capacities or the intensity of his thirst. Those invited were to have "wine," a luxury, and "milk," a staple necessity, without money and without price. The currency of the kingdom of Heaven is grace (v. 1).

(2) Who Will Come? (v. 3). Only those who are listening and who are attentive. Many fail of eternal life because they do not pay attention to the claims of religion. "Come unto me," (Matt. 11:28). We go to God for salvation and help, and we find life. Life is more than mere existence. It is the natural, harmonious, joyous activity of every part of our being. The result of coming is, "your soul shall live," and the surety of it is, "an everlasting covenant." Literally, an agreement with promises which can never be broken, namely, "the sure mercies of David." (See II Sam. 12:29; I Cor. 17:7-27; Ps. 89:1-4; also Luke 30:41, 44). We are bought, but we did not pay the price. The mercies of David are the antitype of our Savior; the mercy of grace. True satisfaction is in its right order. (See vv. 2, 3). Christ is a faithful witness, the exalted one, (v. 5) to this covenant.

(3) When to Come (v. 6). While he may be found, and while he is near, implying a time when he may not be found and a time when he will not be near. All of God's promises are conditional.

(4) The Way to Come (v. 7). Forsake open sin, turn from unrighteous thought, turn to the Lord and receive his "multiplied pardon." Man is everywhere depicted in the Scriptures as wandering away from the true God and there is no salvation if we insist on continuing in sin.

II. The Transformation (vv. 8-13). God's promises have back of them all the power of the universe and are as certain as the process of the seasons. In working out his transformation in the character of man, we are to think his thoughts after him. We see and know only very little of this spirit, but God sees, knows and controls the universe, which is at his command. (I Cor. 10:13; Phil. 4:19). We are to enter into his way, and his ways are as the heavens, higher than those of the earth. Having entered into his ways we are to bring his fruits (see John 15). If the Divine seed (v. 11) is implanted within us, then we may expect to see the fruits of the kingdom of God, which are born of the spirit. (Gal. 5:22-26). This transformation involves service, for we are to have a mission, "go out to all the earth," being led by the Messiah and thus receive "joy and peace." As sure as "the rain cometh down and the snow from heaven and returneth not, but watereth the earth," so is the seed of the Word in the hands of the sower, to become bread to the eater. As we go forth we have his promise (v. 11) that, "it shall not return void, but shall accomplish that which I please, and it shall prosper in the thing whereto I sent it."

As a result the "thorns" (evil) shall be displaced by "fig trees" (good). God's word bears fruit in implanted lives. (John 6:33; James 1:18; I Peter 1:23). God calls this word, which is spoken of by the prophet, "My word." What the prophet says, God says. What an inspired man says, God inspires him to say. God's promise will be consummated in redeeming society, as well as redeeming creation (vv. 12, 13; Ch. 35:10; 49:9, 10; 51:11; Jer. 31:12-14; Isa. 25:1, 2). The language about the mountains and hills breaking forth into singing, is interpreted in Psalms 65:11, 13.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Inclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date 1917 spring and summer catalog, containing over 550 designs of ladies', misses', and children's patterns, also some points for the needle. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

1367—Child's rompers and cap. The pattern is cut in 3 sizes: 2, 4 and 6 years. It requires 2½ yards of 36-inch material for a 4-year size. The cap requires 1¼ yards of 24-inch material.

Waist 2135-Skirt 2131—Smart and attractive. The skirt pattern 2131 is cut in 6 sizes: 22, 24, 26, 28, 30 and 32 inches waist measure. It requires 5 yards of 44-inch material for a 24-inch size. The waist pattern 2135 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure, and requires 2⅞ yards of 44-inch material for a 38-inch size. Two separate patterns, 10 cents for each pattern.

2140—A popular model. Pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Size 36 requires 7 yards of 36-inch material.

2151—Girls' dress with sleeve in either of two lengths. Pattern is cut in 4 sizes: 2, 4, 6 and 8 years. It requires 3¼ yards of 24-inch material for a 4-year size.

2143—An ever-popular middy style. Pattern is cut in 5 sizes: 4, 6, 8, 10 and 12 years. It requires 4¼ yards of 27-inch material for an 8-year size.

1743—Junior dress, with two styles of sleeve and with underwaist. Pattern is cut in 3 sizes: 12, 14 and 16 years. It requires 1¼ yards of 27-inch material for the underwaist and 5½ yards for the dress for a 14-year size.

2137—A smart little dress for mother's girl. Pattern is cut in 4 sizes: 4, 6, 8 and 10 years. It requires 3¾ yards of 36-inch material for an 8-year size.

2138—A simple nightgown. Pattern is cut in 5 sizes: 12, 14, 16, 18 and 20 years. Size 16 requires 4⅛ yards of 36-inch material.

2136—A neat and becoming house dress. Pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 7 yards of 36-inch material for a 36-inch size.

1977—A smart and practical ladies' apron. Pattern is cut in 4 sizes: 34, 38, 42 and 46 inches bust measure. It requires 7¼ yards of 36-inch material for a 38-inch size.

1756—A new skirt model. Pattern is cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. It requires for a 26-inch size 3⅝ yards of 44-inch material.

2005—Ladies' shirtwaist, with or without yoke, and with collar rolled high or low. Pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 3¾ yards of 36-inch material for a 36-inch size.

Plans for uniting the 7,000 flour mills of the country to aid the government in its task of food distribution are now being worked out, according to an announcement by James F. Bell, Minneapolis flour man, who is chairman of the United States millers' committee formed by request of Herbert C. Hoover, public food administrator. An open address, published here today, and signed by Mr. Bell, says: "A flour mill in active operation may become of equal or greater value than a regiment of troops."

Can nothing that can be kept without canning. Dry such vegetables as corn, string beans, navy beans, mature lima beans, okra, etc.

A real furnace. Heats whole house comfortably, dependably, cleanly and economically *from one register.* Exactly same construction as the old reliable *Mueller* line, but without pipes or flues. Ideal for old or new homes and buildings with small or partial cellars. Saves 35% in fuel. Burns hard or soft coal, coke or wood.

Made of solid cast iron, has triple jacket, substantial firepot and radiator, best type grate. Designed right, built right. 60 years of experience and the *Mueller Guarantee* behind it.

Tear out this ad, write your name and address on margin and mail to us for valuable free book on pipeless heating, and name of nearest Mueller dealer.

L. J. Mueller Furnace Co., 204 Reed Street Milwaukee, Wis.

Makers of Heating Systems of All Kinds Since 1857

"Drive" on Badger Stumps.

Land Clearing Demonstrations Again in Full Swing and Much Practical Information Being Given on Subject of Clearing Cutover Sections.

THE biggest demonstration of pulling stumps ever undertaken began its fourteen weeks' tour through northern Wisconsin at Murry, Rusk county, July 16th. The demonstrations are carried on by the college of agriculture and are under the direction of F. M. White, of the agricultural engineering department of the college. The work this year will be somewhat different from that of the two previous demonstrations in that it will be much more extensive. Not only demonstrations will be given—these are going on all the time—but the labor and time required to pull stumps by hand, machine or horse power or powder will be carefully noted. Each method of land clearing is given a thorough trial on a space of one or two acres set aside for that particular method. Getting rid of stumps under varying conditions of types of soil, size of stumps and number of stumps per acre in the quickest way possible is the object of the work. Nowhere has there ever been a careful check made on the amount of labor and time required by the different methods. Facts in regard to this will be gathered on this trip.

The blasting of stumps requires some knowledge of how to figure on the power of the explosives that are to be used. At this demonstration an expert from a large powder company is on hand to give definite information on the number of sticks it will require to blast a stump of twenty or eighty inches across in clay or sandy soil, where to place the charge in order to do most effective work, how to load a cartridge without any danger to the operator, and how to blast by the electrical method or with fuse and match.

Companies manufacturing machinery for pulling stumps are also represented and the visitor to these demonstrations can investigate each company's claim to his own satisfaction. They have skilled men on the job who are able to show the visitor how stumps can be removed by horsepower pullers. The work of clearing a space of an acre or two at one setting of the machine can be seen here. The men in charge will gladly show the proper ways of attaching a cable to a stump, how to crack a stump before pulling it or how to pull it and then crack it in order to make it easier to drag the stump over to the piler. Root hooks for the snags and time-saving and labor-saving methods for getting at the blind stumps are also shown. A one-man outfit, which is just what the name implies, an arrangement by which one man can pull stumps successfully, is likewise included. Block and tackle pulling with rope and chain is given a tryout alongside of the commercial pullers. Two kinds of pilers are building the stumps into piles ready for burning.

AN IRRESISTIBLE FORCE AGAINST STUMPS.

Ten acres were secured at Murry by the college to carry on this work. Similar tracts have been spoken for at each of the stops that are to be made along the route. These ten acres were divided up into two-acre plots and on each a different method of removing stumps was practiced. The first three days were given over to gathering information on the size of each stump blasted or pulled, the time required and the labor necessary to do the work. The last days were devoted entirely to demonstrations. While people were welcome on all days, the last days were given over especially to answering questions for visitors from all over Rusk county and beyond. No grand stand blasting was done, nor were extraordinary stumps left for the last days. It is not the object of those in charge to make people wonder at the spectacular things than can be done with powder and puller, but the object is to give honest, every-day demonstrations of the work of clearing land quickly with a minimum of labor. A similar program of gathering data and giving demonstrations will be followed at each stop.

The companies coöperating with the college of agriculture in this work are the Du Pont NeMours Co., of Wilmington, Delaware; the Kirstin Co., of Escanaba, Michigan; the Flynn Co., of Superior, Wisconsin; the LaPlant Choate Co., of Cedar Rapids, Iowa, and the Merrill Iron Works, of Merrill, Wisconsin. Owing to a slowness of freight movements the last two companies were not able to begin work at Murry, but will join the special later on.

GETTING THE BIG ONES WITH A PULLER.

Northern Wisconsin should be greatly benefited by the demonstrations which have just commenced at Murry and which will be held in fifteen different localities in the northern half of the state. Seventy-eight per cent of Rusk county, for instance, is within five miles of a railroad. Nevertheless, only 2 per cent of Rusk county is under the plow. Crops in Rusk county on the land that has been cleared are equal to those of our southern counties both in yield and quality. The college of agriculture realizes that this condition which is true of most of our northern counties can be more quickly overcome when proper methods for getting rid of stumps have been worked out. The demonstrations that are carried on in connection with the experimental work will be a means of convincing old and new settlers that it does not require a lifetime to clear an unimproved piece of land. The experimental work must depend upon months and probably years of careful observation in order to be of value in regard to facts and figures. The demonstrational work, however, will be of immediate value in that one can see in one or two days' time how fast an acre can be cleared by any of the various methods now advocated. The old timers generally do not look with favor upon this work of showing the northern Wisconsin farmer on how to clear his land. Yet their objections can hardly be said to be based on anything better that they might know of. As a matter of fact, the methods which will save time and labor are not being followed by many of the settlers at this time. New settlers have always had considerable difficulty in learning about the method by which land can be most easily cleared. This year and in the years to come new men will make their homes in northern Wisconsin in greater numbers than ever before. As a rule, these new farmers are used to a different type of farming altogether. What holds true in Iowa and in Illinois does not apply to northern Wisconsin. The entire system of farming that these men have been used to for years must be adapted to meet the conditions of a new country. To these men the demonstrations are invaluable. Their neighbor might have cleared his farm with one type of machine or by blasting or even by hand. The newcomer would have to travel many miles, however, and use up considerably more than a day or two, in order to find a man for each of the methods that are now being practiced in clearing land; and then he would not have the service of the expert to answer every question of the machine

PILING THE STUMPS FOR BURNING.

Here's The Best Engine I Ever Made—My Patriotic Prices Save You Big Money!

Galloway Saves You On First and Last Cost with Best Engine Built

Don't be fooled on the engine question. Let Galloway post you on the secrets of engine making and selling. I'll tell you some engine facts in my book that will astound you. Learn the truth about engine claims and know all about heavy weight engines, light weight, four cycle engines. What horsepower, bore and stroke mean. Learn how to judge engines. Then see how dealing with me—Galloway the maker—you can save on your engine and get the type exactly suited to your needs. You cannot make a mistake after you read my free book.

It's My Masterpiece Engine

I call it that because that's exactly what it is. It has features (exclusive features), that make it the best engine ever made, bar none. Point for point—part for part—it excels every other engine I know—and I know them all. Test it—try it—any way for any kind of work—tough or easy jobs—and you'll agree with me that my masterpiece engine is a masterpiece in every sense. If you pay less than my price you skimp on quality. If you pay more, you pay too much.

I Guarantee the Biggest Engine Value in the World—Write and Ask Me to Prove It

Yes sir, the best engine—quality for quality—size for size—power for power—at the price. That's what I offer you in my Masterpiece Six. And I'll give you brand new, this-year engine improvements that are exclusively mine—cannot be had on any other engine but the Galloway. For instance, adjustable bearings, economy carburetor, valves-in-head, double ball governor, water-cooled cylinder head, automobile-ground valves.

Power Test On Your Own Farm

But you don't have to take my word, or anybody's word. You can try my Masterpiece Six on your own farm for a free power test if you want to. Let the engine—by the work it does for you—decide whether you'll keep it. Test it on easy, hard or medium work. It's all the same—but test thoroughly before you decide.

GET THIS FREE BOOK with Patriotic Prices

It tells everything you ought to know about engines. How to pick them out and why you should demand a heavy weight, large bore, long stroke and low speed. It also explains Galloway's direct-to-you plan of selling and why it means you get your engine at these patriotic prices at the time when the nation is calling for big crops. Write for the book today, sure!

CHOICE OF FIVE BUYING PLANS

It's easy to own a Galloway Masterpiece Six or any other size Galloway engine. My fair buying plans give you the terms you like and a power test on your farm. Send tonight for this book. Learn these engine facts, and facts on Separators, Spreaders, Tractors and other implements. A postal will do. We ship from St. Paul, Chicago, Council Bluffs, Kansas City or Waterloo factories.

Wm. Galloway, Pres.
Wm. Galloway Co.
35 Galloway Station
WATERLOO, IOWA

clearing and stump blasting work. The concerns which are interested commercially in the land-clearing work as well as the railroads that traverse the cut-over sections are doing a commendable service to northern Wisconsin by coming forward in the manner in which they have, to help in every way possible to make this land-clearing special a success. It is costing every one of these concerns good money to coöperate with the college and there are no immediate results in sight. The great cry that has gone up for increased acreage and increased acre yield in order to produce a maximum amount of foodstuffs within the next few years is finding an excellent response on the part of these companies. After Murry, July 16th to 21st, the train moved to Kennan, in Price county, where it will be from July 23d to 28th. The route after that is as follows: July 30th-August 4th, Holcombe, Chippewa county; August 6th-11th, Joel, Polk county; August 13th-15th, Frederick, Polk county; August 15th-18th, Siren, Burnett county; August 20th-25th, Hines, Douglas county; August 27th-September 1st, Brill, Barron county; September 3d-8th, Seeley, Sawyer county; September 10th-15th, Washburn, Bayfield county; September 17th-22d, Mercer, Iron county; September 24th-26th, Merrill, Lincoln county; September 27th-29th, Rhinelander, Oneida county; October 1st-6th, Phelps, Vilas county; October 8th-13th, Laona, Forest county.

The drudgery has been banished from the work of stump pulling and stump lands, being the cheapest land available to a farmer today, will be sought after by settlers more eagerly in the years to come than ever before. Some acres have a hundred stumps on them, others not as many. Some stumps come out readily and others pull hard, but the work for the man is nearly the same in every case. Where he does not wish to use horse power he can use powder, and where he wishes to use both he can do so at a saving of time, labor and money. Each condition, however, requires separate attention.

SPLITTING STUMP WITH DYNAMITE AND PULLING IN TWO SECTIONS.

Cow-Testing Reports.

Pure-bred Holstein the High Cow.

To the Editor:—In June we had seventy-four cows which produced over forty pounds of butter fat. Our record for July will probably be about as good. Pastures are still good. Some of the farmers in our association are feeding grain all summer. The corn crop was behind until about the second week in July, when it began to pick up, and prospects are now good. Clover is very heavy this year and it is lodging in many places so that farmers are cutting it from two sides. Our forty-five-pound list for June follows:

Owner, name and breed	Age	When fresh	Lbs. milk	Per cent of fat	Lbs. B. fat
Steven Dvorak					
Beauty, N.	6	Apr. 7	1290	3.7	47.73
Frank Hessel

Jersey Cows Making Good Records.

To the Editor:—A registered Jersey herd owned by Ora P. Taylor, of Elkhorn, is doing very good work in the Geneva Coöperative Cow-Testing Association this year. Eminent's Lily White 287410, has made the best record for one month of any cow in the herd, she is a four year-old, freshened March 29, 1917, and for the month of May she produced 1,048 pounds of milk, testing 6.7 per cent, making 70.2 pounds of butter fat. For June she produced 1,107 pounds of milk, testing 6.7 per cent, making 74.2 pounds of butter fat. When she made her June record she was on pasture and was just getting a small amount of silage when she was put in the barn to be milked.

Erma's Rosebud 287415, is another four-year-old cow which has done very good work. She freshened November 6, 1916, and has made 436.1 pounds of butter fat in seven months and twenty-one days. She has never made a real large record for any one month, the largest being only 68.6 pounds of butter fat, but her production has held quite uniform one month with another making 792 pounds of milk, testing 6.2 per cent, making 49.1 pounds of butter fat for the eighth month in milk.

Ernestine's Rosebud 375680, the first daughter of Erma's Rosebud, and sired by Noble's Reindeer 111171, freshened January 3, 1917, at the age of eighteen months and has produced 166.9 pounds of butter fat in five months and twenty-five days.

Mr. Taylor has eighteen pure-bred Jerseys in milk at the present time and all of them are making very good records. Up to the present time Mr. Taylor has not tested his cows officially, but contemplates doing so next year.

Guernseys Make Good Showing.

To the Editor:—Mr. C. E. Ericksen carried off the honors in the Alban-New Hope Cow-Testing Association for the month ending July 4th, with his herd of Guernseys. Ten cows which completed the monthly test averaged 774 pounds of milk and 37.9 pounds of butter fat. The cost of feed per cow was $5.82 and the total value of product per cow $17.79, making a profit of $11.97. One grade Guernsey in this herd produced 1,141 pounds of 4.8 per cent milk, making 54.8 pounds of butter fat. Mr. Ericksen is a firm believer in feeding his cows a certain amount of grain with summer pasture. Herds which averaged a pound a day of butter fat or better are as follows: G. J. Olstad, Holsteins; F. Leroy Larsen, Guernseys; Moore & Galloway Lumber Co., Herefords; J. P. Madsen, Guernseys; M. J. Wrolstad, Guernseys; F. L. Taylor, Holsteins; A. L. Brekke, Holsteins; E. O. Hellem, Guernseys; F. A. Nace, registered Holsteins. The forty-five-pound list for the month follows:

Owner, name and breed	Age	When fresh	Lbs. milk	Per cent of fat	Lbs. B. fat
C. O. Wogsland					
Belle, R. Gur.	5	3-6-17	859	6.2	53.3
C. E. Ericksen					
Rolin, G. Gur.	9	2-29-16	1012	5.1	51.6
Whiteface, G. Gur.	9	3-3-17	1141	4.8	54.8
G. J. Olstad

Netherland, R. Hol.	5	4-7-17	1488	3.6	53.6

F. W. Drake, Official Tester.
Leo D. Dunlap, Secretary.

Columbus Association.

To the Editor:—Our forty-five-pound list for the month ending July 12th follows:

Owner, name and breed	Age	When fresh	Lbs. milk	Per cent of fat	Lbs. B. fat
R. F. Kalkhorst					
No. 12, P. B. Hol.	6	4-29	1041	5.2	54.1
A. L. Leffingwell					
Eddy, G. Jer.	5		936	4.62	52.6
Daffodil, G. Jer.	2	5-21	795	5.97	47.5
Julius Heyden					
No. 37, P. B. Hol.	6	5-1	1551	3.6	55.8
Henry Dolan					
Emma, G. Hol.	4	4-7	1446.5	3.6	52.1
August Goldner					
Boldt cow, G. Hol.	5	4-7	858	5.5	47.2
John Bradley					
Nancy June, P. B. H.	8	2-28	1467	3.5	51.4
B. C. Mercedes Pontiac					
P. B. Hol.	4	4-7	1368	3.3	45.1
Courtland Rose B. C.					
P. B. Hol.	4	3-11	1239	3.9	48.3
J. E. Barstow					
Blackie, G. Hol.	8	3-1	1209	3.9	47.2

The best herd average was Henry Dolan's which was 1,135.1 lbs. milk and 35.6 lbs. fat.

C. F. Wehrwein, Official Tester.

Considerable interest is being manifested in the stocker and feeder show to be held in South St. Paul September 20th and 21st. A sale will close the show and H. O. Tellier, well-known auctioneer, of Farmington, Minnesota, has been engaged to cry this sale.

Separators for Cheese Factories.

Cheese factories of Wisconsin are not all using whey separators, though the whey separator has proved its worth wherever it has been installed. Aside from the fact that the butter fat lost in cheese making is not being turned into a profitable product by the factory, it is safe to say that not half of the fat contained in the whey tank is utilized by the patrons for feeding purposes.

The accompanying picture is a good illustration of average conditions. The tank setting on the lower side of the factory has over it a platform with a pump on it. This pump takes the whey from the bottom of the tank. The warm whey flows from the factory into the tank each day. The fat globules in the whey rise to the top. As the pump reaches to the bottom of the tank only the thin portion containing no fat is taken out and the fat remains in the tank. As new whey is added more fat rises to the top only to go to waste because of the system.

D. S. Bullock, field man for the Live Stock Breeders' Association, who took this picture, is authority for the statement that in many instances from one-half to three-quarter-inch layers of fat are present in these tanks. The fat goes up and down in the vat as the whey is added and taken away. Each day more fat remains in the tank. When the tank needs cleaning the cheesemaker takes this fat, which is by this time a sticky mass, and buries it. That is good profit going to waste, as can be proved by the factories which have installed the whey separators.

THIS SORT OF TANK AT OUR CHEESE FACTORIES SHOULD BE DONE AWAY WITH.

In 1916 the figures from twenty-eight factories taken at random from Dane, Iowa, Lafayette and Green county establishments showed a profit from whey cream which averaged for each of the twenty-eight factories $1,426. This profit is going to waste in hundreds of cheese factories in Wisconsin. It is a situation which ought to be remedied at once.

A whey separator will do this. It will conserve the butter fat for the patrons and turn waste into dollars. Under the existing conditions neither factory nor patrons make use of the butter fat contained in the whey. The greater portion of it actually rots on the surface of the tank until it is necessary to clean it out and cover it up. Said one patron: "The best we ever do with it is daub it all over ourselves when we try to take it out of the tanks with a bucket."

Factories which have the separator installed pump the whey to a tank overhead from which it feeds automatically into the whey separator. This butter fat can be sold to butter establishments which make a business of turning this product into butter. There is a chance here for an added profit for every one of our coöperative cheese factories and the thousands of patrons supplying these factories will do well to look into the matter.

Keep as Many Cows as Possible.

To the Editor:—In my judgment the most important things for the Badger farmer to consider in the next three months is the careful and thorough cultivation and harvest of his crops; the construction of more silos wherever such are needed for winter feeding and for supplementing pastures in summer. They also need to study carefully the optimum utilization of labor. To this end an effort should be made to keep as many cows per man as one can reasonably handle. The nation is looking to Wisconsin to play a large and important place in supplying dairy products, and we need to speed up along this line, with a view of at least increasing our output 25 per cent.

An enterprising farmer in Jefferson county has recently arranged with a number of boys from his town to go to the farm in the morning and under proper supervision spend their time in hoeing corn. The boys carry their lunches with them in order to save extra work for the housewife. This is serving two useful purposes—it is helping increase the food supply and it is helping to develop the boy.

D. H. Otis.

Emergency Food Agent Jefferson and Waukesha Counties.

Care of Cream in Hot Weather.

To the Editor:—In the care of cream on the farm and also in the way it is delivered to the creamery in hot weather there are many different methods employed. Frequently where only a few cans are produced the cream is allowed to remain on the farm too long before it is delivered at the creamery. This, of course, results in cream of a poor grade. In many cases the cream is cooled too slowly. Just the other day I was at a farm where the cream was cooled by placing it in a tub of water. The cream warmed the water and the water cooled the cream and soon both reached the standstill stage. I happened to be there when that stage had been reached and I should judge that the temperature was 70 degrees. At that temperature bacteria work vigorously and undesirable flavors are the result.

Just as soon as possible after the cream has been extracted from the milk it should be cooled to a temperature below 60 degrees and kept cool until delivered. When the milk is taken from the udder it has a temperature of about 98 degrees Fahrenheit, which is just right for the work of the wrong kind of bacteria. The average well water has a temperature of about 50 degrees and offers a very practical means to cool the cream on the farm. One of the cheapest ways of doing this is to provide a small tank through which all the water must pass before it goes to the stock watering tank. This tank should be placed in a building so that the warm rays of the sun will not shine on the cream cans and so that the cream will have some protection from the storms of summer.

Shotgun cans are best in which to cool the cream, as the cream cools more quickly in them and they are more conveniently placed in and taken out of the tank than other receptacles. The cream should be stirred while being cooled. Stirring hastens the cooling process by liberating the animal heat and bringing the warm parts of the cream in contact with the cool sides of the can. In running the water into the tank and out again it is a good idea to have the inlet at one end at the bottom and the outlet at the other end and at the top of the tank. A clean cloth spread over the top of each can to keep out dust is better than a closely fitting lid, a change of air thus being assured which helps to keep the cream odorless.

Some of those who employ this method of cooling cream like to have the cream separator in the same building. This is not a bad plan where there is plenty of room and the machine is kept as clean as possible. The room, too, must be kept clean, of course. Wherever there is a board floor in the milk house it will be found difficult to keep it clean and sweet, for when milk or cream is spilt, it begins to decay and then it is almost impossible to keep a floor as clean as it should be. A concrete floor is much better than wood and it does not cost any more than the average board floor.

When cream is being transported from the farm to the creamery or shipping station it is important that the cans be protected from the rays of the hot sunshine. I have known cream to be hauled four or five miles in hot weather without so much as a blanket over the cans. Under such conditions the temperature of the cream frequently rises as high as 12 degrees during transportation. Such a rise in temperature encourages souring and a low grade of cream. In hauling cream in hot weather a wet blanket should be placed over the cans and this in turn covered up with a dry one. Felt jackets for the cans can be obtained from dealers in dairy supplies and in our experience in using them we have found that they are worth a good deal more than they cost. They are easily slipped on and off the cans and help wonderfully in keeping the cream cool during delivery.

Subscriber.

Farm Cheese Making.

To the Editor:—In the June 7th issue I find an inquiry about how to make cream cheese. I have found a good many who have preferred mine to that bought at the stores.

If the evening's milk is to be used together with the morning's milk, it should be strained into common cans or any suitable vessel, which in warm weather is placed in cold water or otherwise kept cool until the next morning. It is a good plan to stir the milk well before going to bed, partly to help it cool quickly and partly to prevent too much cream from rising. The next morning after weighing the morning's milk, it may at once be strained into the cheese tub. Then pour in the evening's milk and stir

COW-EASE GUARANTEED TO MAKE GOOD OR I WILL!

MY personal money-back guarantee is back of every can. Cow-Ease is not an experiment, but a tried, sure fly-repellant that has made good for sixteen years. I originated it and I *know* that

COW-EASE

Keeps Flies off Cattle and Horses

It is an absolutely harmless liquid—applied with a sprayer. It does not gum the hair or blister the skin. Its cost is trifling, and a gallon will spray a cow over 200 times.

Cow-Ease positively keeps flies away and keeps your cows quiet and contented. You reap the benefit in more milk and *better* milk, and in easy milking. Flies not only irritate your cattle and reduce the milk yield but they are ladened with deadly disease germs. Get rid of them.

Thousands of farmers and dairymen are using Cow-Ease to their profit. Why not you? Remember I personally guarantee satisfaction or "your money back." Ask your dealer for Cow-Ease to-day

M. Elton Vose Vice-President.

CARPENTER-MORTON CO. 87 Sudbury St., Boston, Mass.

Manufacturers of Cow-Ease. Established 1840.

TRIAL OFFER If your dealer cannot supply you, send me his name and $1.25, and I will deliver prepaid to your address a half-gallon can of COW-EASE and SPRAYER for applying. For west of Missouri River and Canada, above Trial Offer, $1.50.

High Feed Costs Smashed!

Down they go—to *smash!* In scads of cases cut down a HALF! Thousands of farmers are selling their No. 1 hay, milling off-grades. They're making the grandest alfalfa chop; fattening hogs, cattle, sheep, poultry and *purses!* making it cheaply, easily, with our famous patented Recutter Attachment (sizes for fields use). Handles leaves, stems and all! No waste! no injuring color of hay. Makes dandy combination feeds from clover, rice, straw, cornstalks, bean straw, pea vines, oats and rye. Biggest guaranteed capacity 1,200 to 2,700 lbs. per hour. 600 to 900 lbs. of meal per hour with Junior Mill (run with 6 to 8 h. p. engine). Cracks peas, corn and beans.

SMALLEY SILO FILLER

SEVEN SIZES

Tremendously simplifies silo filling. Grip Hook Force Feed table automatically feeds cutter—saves wage and board of from one to three men. Makes richest feed, increases silo tonnage.

Blower built independent of cutter. Let your fan spin fast or slow, the speed of knife shaft is unchanged. No belt to slip, wear out, and waste time, money, power. Patented low-speed one-pulley chain drive is faster, cleaner. Saves 1-8 to 1-4 power costs! Powerfully built. A fourth heavier, with wonderful record for long service. Handsome new catalog FREE. Write for it to Dept 55 SMALLEY MFG. COMPANY Manitowoc, Wis.

Only $2 Down

One Year to Pay!

$29 Buys the New Butterfly Jr. No. 2. Light running, easy cleaning, close skimming, durable. Guaranteed a lifetime. Skims 95 quarts per hour. Made also in five larger sizes up to No. 8 shown here.

30 Days' Free Trial Earns its own cost and more by what it saves in cream. Postal brings Free catalog, folder and "direct-from-factory" offer. Buy from the manufacturer and save money.

ALBAUGH-DOVER CO. 2168 Marshall Blvd. CHICAGO

100,000 now in use

well. Any common tub or tight wooden box may be used for cheese tub. If you have an open boiler the milk may be heated in a shotgun can or a tin bucket placed right in the boiling water, but it must be stirred all the while unless the temperature of the water is as low as 140 degrees, when it may be left alone, though the heating takes much longer if not stirred. This way of heating I have found the best, as it is always necessary to have a large boiler for heating water for cleaning purposes and it is much safer than heating it over direct fire.

When the milk is heated to 84 degrees, remove the can from the boiling water and add the rennet. If coloring is to be used, this must be stirred in carefully before adding the rennet. Cheese color can be bought in fluid form in the same sized bottles as butter color. Some do not use it at all.

For farm cheese making rennet tablets are very handy to use. The number of tablets required is one for every hundred pounds of milk. This tablet should be dissolved in pure cold water and the solution is then added to the milk. Stir well four or five minutes and stir now and then gently on the surface so as to prevent the cream from rising, but take care to stop in time so that coagulation be not disturbed. Cover the vat and if a reliable rennet is used in the right quantity it may be left about half an hour without any attention. After that it must be watched closely and whenever the curd splits or breaks clean when a finger is passed through it, it is ready to cut. The cutting may be done with any knife which is long enough (it can be made out of tin or hard wood). With this the curd is cut crosswise, taking care that it is cut right down to the bottom of the vat. Then take a common skimmer, insert it slowly and then gently lift it up, and allow the curd to break by its own weight. When the whole mass is reduced to cubes of two or three inches, leave it for about five or ten minutes, then stir the curd gently, breaking up the pieces until they average one-half or one-fourth inch in diameter. The curd is now left to settle and as soon as possible part of the whey is dipped off into a can or pail. Stir again and when settled dip off more whey. Keep this process up until the curd feels shotty or the particles are hard enough to rub between the fingers without sticking together.

Add good dairy salt at the rate of four ounces to the curd from 100 pounds of milk. Too little salt allows the cheese to ripen too fast and too much salt will make the cheese too dry and prevent its curing properly. Of course, the salt must be distributed evenly in the curd.

It is now filled into the molds or hoops. The best hoops are made of heavy tinned iron, but can be made of wood if only care is taken to have it perfectly straight and smooth inside. Place a piece of cheesecloth inside the hoops and have folds as smooth as possible. When full, the edges of the cloth are laid smoothly over and the lid is put on.

This cheese is usually pressed twenty-four hours. The pressure must be about 500 pounds for a ten-pound cheese. When taken from the press it is bandaged by sewing a piece of cheesecloth around it. The room in which it is kept should be well ventilated and the temperature considered best is between 50 and 60 degrees. The cheese should improve until it is ten or twelve months old, but can be eaten any time.

Mrs. Anna Frank Sorensen.

THE INDIANA SILO

Fifty thousand are now in use on the finest farms in America.

If you are going to buy a silo—this satisfactory service rendered everywhere—should be of special interest to you.

The cost of all materials is advancing like the price of wheat and corn.

Why not save money by contracting for your silo now. It undoubtedly will cost you more next spring or summer.

Let us send you our proposition—to contract now for your silo and deliver it later.

We still have openings for a limited number of farmer agents.

Waukesha County Holstein Meeting.

The summer meeting of the Waukesha County Holstein-Friesian Breeders' Association will be held at the home of Mr. Fred Pabst, Oconomowoc, Wisconsin. Mr. Pabst is one of the largest breeders of Holstein-Friesian cattle in the United States and stands out as being a leading man in the Holstein industry in Wisconsin.

The principal speakers of the day will be Mr. Moscrip, Lake Elmo, Minnesota, who is recognized as being the best judge of Holstein-Friesian cattle in the United States. Mr. Moscrip judged at practically all of the large fairs and dairy shows last fall. He was judge at the Waterloo Dairy Cattle Congress, at the National Dairy Show, at the Minnesota State Fair and at the Illinois State Fair. Mr. Moscrip owns a large herd of the famed "Black and Whites." His herd is founded upon size, individuality, uniformity and production. Another speaker of the day will be Hugh G. Van Pelt, of Kimball's Dairy Farmer, Waterloo, Iowa.

J. E. Stallard, recently selected by the county board of Waukesha county as a county agent, is to begin his new work on August 1st and will be introduced to the county at the meeting on August 2d. The county association took an active part in securing a county agent for Waukesha county. The project was first put before the county board by the association two years ago. The association thus takes pleasure in the introducing of Mr. Stallard to the county on that date.

Another feature of the day will be the sale of a pure-bred heifer calf which is to be given to the Red Cross movement by the association. The calf's name is Brookvale Segis Burke and comes from the herd of D. J. Howell, who recently sold a two-year-old heifer at the Waukesha County Holstein sale for $2,150. The dam of the calf, Segis Pontiac Burke, is from Sir Urmagel Burke, a 31-pound bull with a sister who made 35 pounds of butter in a week. Her dam has a record of 25.06 lbs. butter in seven days. Sir Urmagel Burke has 39 A. R. O. daughters. Several of them with records between 25 and 30 pounds of butter in a week. He is by a three-fourths brother to De Kol Burke, who has 77 A. R. O. daughters, including several world's record animals. The dam of the calf was bought at the Waukesha sale by Aitken Brothers from Mr. Howell for $500.

The plan for the day will be as follows:

10:00 a. m. Assembled at Pabst Stock Farm No. 1.
10 to 11 Trip by auto to visit the famous Pabst herds.
11:00 a. m. Judging demonstration by Wm. Moscrip at Farm No. 1.
12:00 Charcoal dinner served by Mr. Pabst in the large open-air arena on the Pabst ground which is situated just west of Farm No. 1.
2 p. m. Address, "How to Feed the Dairy Cow Under the Present Feed Conditions," Hugh G. Van Pelt, Kimball's Dairy Farmer, Waterloo, Iowa.
3 p. m. Introduction of J. E. Stallard, county agricultural agent.
4 p. m. Sale of Red Cross calf.

Music and other entertainment will also be provided.

Mr. Pabst's farms are located between Delafield and Oconomowoc. The roads leading to the farm are in excellent condition.

Persons who take the trip by street car get off at Nashotah station, which is a short distance from Farm No. 1.

Dr. L. R. Jones is responsible for the statement that root crops are more susceptible to lightning injury than other plants, while the grasses and cereals as well as cotton are completely safe in the worst electrical storm. Wisconsin potato fields are open to lightning damage, the stricken spots usually varying from a few feet to a rod or more in diameter.

INSURE YOUR CORN CROP NOW

No matter what your corn crop is like you need a

GEHL SILO

A good corn crop pays its biggest dividends when in a silo. A poor corn crop can be saved only by a silo. At present prices a silo will pay for itself the very first season.

Don't wait until your crop is ready for harvesting before you build a silo. There is a serious shortage of silo building materials this year and you may not be able to buy later in the season. Insure your corn crop now. Write at once for prices and description of Gehl Silos.

GEHL BROS. MFG. CO.
203 South Water St., West Bend, Wis.

The President Says:

"It is of the most imperative importance that everything possible be done and done immediately to make sure of large harvests."

Conserve and Increase Your Forage Crops

Turn under part of your pasture and plant it to saleable crops. Feed your stock cheaper, easier, more profitably with a few acres of corn cut into ensilage with a Kalamazoo Ensilage Cutter and stored in a Kalamazoo silo. Stop wasting land that should be used for money crops. This year, if ever, farmers have a chance to make *big profits*.

Kalamazoo LIFE-TIME-SILOS

are built to meet the exacting farmer's needs. Best in design, material and workmanship. Have every desirable feature a silo should have and embody the "know how" acquired through more than twenty years experience in silo building.

Glazed Tile Silos—fire-proof, frost-proof, storm-proof, decay-proof, vermin-proof. Galvanized reinforcing. Require no paint, no upkeep expense or repairs. First cost is the last cost—a written guarantee goes with every one.

Wood Stave Silos—Your choice of four of the best time-defying woods. Kalamazoo Silos are manufactured complete ready to set up. Quickly and easily erected by inexperienced home labor. All Kalamazoo Silos are made with Galvanized Steel Door Frames and continuous doors, forming a safe ladder entire height of silo.

Write today for our free descriptive booklet. If interested in an Ensilage Cutter, ask for Kalamazoo Cutter catalog. *Easy Payments*, if you wish.

Army and Navy Packet For You

Count the Dots and Win a Beautiful Prize

You see in the picture, an Automobile covered with dots. Can you count the number of dots on this Auto? If you can do this, we will send you as a prize, *a packet of five beautiful Army and Navy post cards*, lithographed in rich colors and also a certificate of entry in our grand contest for a Saxon Automobile. All you have to do is to enclose a two cent stamp in your letter to pay postage and cost of mailing.

SAXON AUTO GIVEN AWAY

Remember the Saxon will absolutely be given away at the close of the grand contest. In case of a tie a Saxon will be given to each person so tied. Send at once so you can be entered in this great contest. Full particulars by return mail. THE AUTO MAN, Dept. 314, Des Moines, Iowa.

Use A Wood Tire Hollow Wall Silo

Cannot Sag, Blow Down or Rot.

Cures and preserves silage perfectly. Prevents freezing of silage. Easy to construct. A real farm building, permanent and rigid. No hoops to get loose. No guy wires. No staves to shrink or swell, but a smooth, double wall from base to roof, the inner wall being of *California Redwood*.

Guaranteed for 20 Years

"But Lasts a Lifetime" WOOD TIRE
AIR SPACE
INNER WALL
OUTER WALL

The patented wood "tire" is built up of inch boards, and shipped in sections. The boards overlap in step formation at both ends. When nailed together, these sections form a ring of unusual strength. The silo frame forms its own scaffolding.

Send for our folder which shows how the Wood Tire Silo is built, and also what owners think of them. A postal brings it. Write today.

Live Stock and Commercial Notes.

Gathered by Representatives of The Wisconsin Farmer.

Giant Invincible One Among Many.

THE best junior yearling boar, of the Duroc breed, that we saw while in Minnesota is owned by J. J. Cain, of Skyberg. Mr. Cain is the breeder that made the big "killing" in the futurity and open classes at Hamline last year, and he is getting ready to come back this year. The attraction on this farm is Giant Invincible, a son of Chief Invincible 2d, he by the noted Chief Invincible. This is the boar that Mr. Cain purchased while attending the Omaha show last fall. He measures seventy-four inches from between the eyes to the root of the tail, stands thirty-eight inches high and has eight and three-quarters inch bone. Combine these measurements with a boar that has quality and conformation and one would naturally expect to find a good one. Giant Invincible is the best herd boar prospect that we know of and we have no doubt but what he will have this boar at Hamline, but he will not be in show condition. He does not want to fat him this year, but expects to show him as a half-ton boar a year from this fall. Just keep this boar in mind and if he doesn't grow out to be one of the best boars in the northwest we will be badly mistaken. The pigs sired by him came late, but they are good for their age. On January 16th Mr. Cain will hold his first bred sow sale and most of the offspring will be bred to this boar. There will also be several sired by him. Remember these notes, for Giant Invincible is one of the coming boars of the breed.—Adv.

At H. A. Derenthal's.

OUR first stop on our trip among the swine breeders of Minnesota was at H. A. Derenthal's, Wyckoff, Minn., who has what is commonly termed the champion, Chester White herd of the Northwest. We found Hank with some 150 spring pigs. He was unfortunate in losing some of his earliest litters, consequently has not as many pigs as generally found on East Side Stock Farm. His show herd is fine and he has an aged herd ready that is a credit to him as a breeder of Chesters. He also has an outstanding showing of "under-year" stuff and will be especially strong with fall gilts. Just at this time Hank does not know whether he will take Ignatz out again this year or not. He has used him heavily and would need to be crowded fast to get in show condition. This boar is siring a fine lot of good-footed, high-backed Chesters and he is worth more as a sire than he is as a show boar. There are some real herd-boar prospects in some fall boars that he has. These have been held back for the select and critical buyer and anyone wanting something choice would not go wrong on one of these boars. They are sired by Ignatz and Callaway's Kind and out of prize-winning sows. One good boar is out of the grand champion sow at Hamline last year. The spring pigs are also being shipped. Wisconsin breeders will make no mistake by getting some of this blood in their herds. Write this breeder.—Adv.

J. J. Reid & Son, Oconomowoc, Wis.

IN interviewing Mr. Reid, Jr., the other day with reference to their herd of Holsteins he informed us that they now have 20 daughters of Tritomia Ormsby. The first two daughters of this sire have made very creditable A. R. O. records, one making 19.7 pounds of butter as a two year old and the other, 17 pounds butter as a senior yearling. Mr. Reid also gave us a bit of interesting news with reference to their herd sire, Sir Pietertje Ormsby Mercedes 43d, the 34.5-pound bull which they purchased from E. C. Schroeder, Morehead, Minn. Early Dawn Peep, a full sister to the dam of their herd bull has just made 1,287 pounds butter in a year. The performance of this cow and the dam of their bull, Aaggie Wayne Peep, makes a world's record for the production of butter in a year for full sisters. The dam of their bull also holds three records for the production of three consecutive years so that their herd sire is now a world's record bull on two points.—Adv.

Chippewa Stock Farm.

L. P. MARTINY, Chippewa Falls, Wisconsin, writes that during June he had a good call for Guernseys from men that were critical buyers. He sold four bulls and four females and still has six excellent sons of Stranford's Glenwood of Pinehurst 6th and Dasher of Sarnia, the latter the second prize two-year-old bull at the state fair, that are for sale. Mr. Martiny has an excellent herd of cattle and the bulls he has for sale will please. Remember this is the home of one of the best aged Poland China boars in the state—Big Bone Wonder. He will weigh well over 900 pounds by fair time and he is a "real boar." Better buy a bull or a boar; Martiny has the goods.—Adv.

Jerseys at Tomah.

E. E. WYATT, Tomah, Wis., needs no introduction in Wisconsin, for, as an officer of the Jersey Breeders' Association and an institute worker he has a large acquaintance. We don't want you to forget his Jersey herd when you are in the market for anything of this breed. He can supply your wants. He also raises Durocs.—Adv.

Herefords for Beef.

SOME of our readers are no doubt interested in Hereford cattle and for their information we want to recommend Walter Bros., Chippewa Falls, Wis., as they have one of the very best herds in the state. Outstanding bulls head the herd and their foundation cows are as good as can be found in the Northwest. They have bulls that will please the most critical. Write them.—Adv.

Wilkins Makes Good Guernsey Sales.

CHAS. A. WILKINS, Platteville, Wis., has one of the good Guernsey herds of the state, containing cows that have excellent A. R. records. In a recent letter he says: "The Guernseys I have been advertising in The Wisconsin Farmer are all sold at satisfactory prices. Am sending you the names of the buyers that you can use as you see fit. Have some fine calves coming on sired by Langwater Frenchman. Will be with you again later." Mr. Wilkins sold bulls to the following: Dickson Bros., Almena, Wis.; Earl Packard, Curtiss, Wis.; Aug. Runde, Cuba City, Wis.; Runde Bros., Cuba City, Wis.; S. S. Wenger, Wakarusa, Ind.; Chas. Lade, Polar, Wis.; Thos. Moran, Arlington, Wis.; Henry A. Marshall, Coopersville, Mich.; Geo. B. Snowden, Platteville, Wis.; Joe Linden, Platteville, Wis. Females were sold as follows: Two A. R. cows and one heifer to Emil Walthers, Medford, Wis.; one A. R. cow to Fred Jenner, Arlington, Wash.; one cow and heifer calf to J. E. Wrage, Arlington, Wash.; one A. R. cow to Richard S. Rawson, Platteville, Wis. The females sold were to be used for foundation cows in the various herd. In passing we might mention that The Wisconsin Farmer was the only state paper Mr. Wilkins used.—Adv.

E. E. Rosencranz, Oconomowoc, Wis.

We were greatly interested in looking over Mr. Rosencranz's herd the other day to note the splendid breeding represented in the pedigrees of the two herd sirs which he is now using. His junior sire is a half brother to the sire of Ormsby Jane Segis Aaggie, the cow that now holds 17 world's records is the dam of the $53,200 bull calf recently sold at the great Wooster sale and the cow that is rated by a number of the most eminent judges of the day as being the greatest living cow of the breed. The dam of this junior herd sire was the first cow bred in Waukesha county to produce 100 pounds of milk in a day and is also one of the first thirty-pound cows. The senior sire is a grandson of Sir Ormsby Hengerveld De Kol. This animal is line bred containing more than 50 per cent the blood of his grandsire. One of the best cows in Mr. Rosencranz's herd is a 24-pound granddaughter of Homestead Junior De Kol, a cow of remarkable individuality as well as one which indicates persistent mark producing tendencies.—Adv.

Orion Col. S.

WE recently saw Orion Col. S. and this good Duroc Jersey boar has done fine since he was shown at Milwaukee last fall. The owner, W. C. Jenkins, Bangor, Wis., expects to show him again this fall and we feel that he will make a creditable showing in the aged class. We consider Orion Col. S. one of the real good big-type boars in Wisconsin—a boar with a wonderful high-arched back, good depth and length, and his breeding is the very best, being by the noted Col. S. Jr., and out of a daughter of old Orion Chief. Jenkins also has one of the largest fall boars we have seen. With a little flesh he would weigh well over 500 pounds. A yearling sired by Pathfinder is also being used in this herd. A senior yearling sow will be shown that is very choice; she is sired by the noted High Model and is a grand sow. Watch for the Jenkin exhibit at the fairs. He will have out some good sows. Don't forget Orion Col. S., one of the good boars in the state.—Adv.

Don't Forget the Northern Grown Durocs.

DON'T overlook the P. P. Schmidt & Sons Duroc herd at New Richmond, Wis. This herd should especially appeal to the farmers and small breeders in the north central and northwestern part of Wisconsin, for the Schmidt Durocs have been raised under northern conditions. The boars and gilts that they have for sale must give satisfaction, they are recommended that way. They come from prize-winning blood and the price is reasonable. Write for details and mention The Wisconsin Farmer.—Adv.

Another Chester White Convert.

THE last addition to the Chester White column in The Wisconsin Farmer is A. L. Kirst, Tomah, Wis., and the pigs that he has for sale will compare favorable with the other advertisers in our publication. Mr. Kirst has not been "in the game" as long as some, but he is a good feeder and caretaker and he has his pigs "coming." July 1st his March pigs weighed right at 100 pounds. His spring crop represents some 50 head of March and April pigs and the owner need not be ashamed of them, for we feel confident they will please the buyer. Mr. Kirst expects to buy an outstanding herd boar this fall and his ambition is to have one of the good Chester herds of the state. He has two choice sows selected for the Madison sale. If you want Chesters—gilts or boars—write this breeder, he'll give you a square deal.—Adv.

Madson & Sons' Polands.

WE recently saw the Madson Poland China herd at Madison, and they are certainly doing fine. We saw their pigs about the same time last year and we are glad to report that they have a much better lot this year. Their pigs are the most uniform lot we have seen. They did not have any early March pigs, the first one came about the middle of the month. Of the 75 head of spring pigs on the farm there are only two runts, which is very uncommon this year. The Defender boar is quite a hog. He is a junior yearling and sired by the good Minnesota sire, Choice Expansion, out of a D's Defender dam that was a winner at Minnesota as a senior yearling. The Madsons have a good boar in Defender and he is siring a nice bunch of pigs. They also have pigs sired by Big Bone Bob by Big Ben and Big Buster by Big Carver. One of the best litters is by Big Pfander, a noted Illinois boar. We will have more to say about the Madson pigs. They will have some fine boars to offer this fall.—Adv.

Mr. S. G. Courteen's Guernsey Herds.

MR. COURTEEN'S Guernsey herd which is on his beautiful estate a few miles from Oconomowoc, Wis., has been improved greatly since we last visited it and we were particularly interested in the new herd bull which is a grandson of May Roma, formerly the world's champion Guernsey cow. Bob Roma Superior is practically a faultless individual sired by Bob Roma and out of the splendid imported cow, Belle Daisy of Sarnia by Galaxy's Sequel. Their senior sire, Glenwood's Champion by Glenwood's Boy of Haddon, is a half brother to Dairy Maid of Pinehurst. He is the sire of a number of very attractive bull calves now on the farm and has to his credit 20 A. R. daughters. His best daughter has 802 pounds butter fat in a year. It will be remarked that Beauty Eagle which sold about a year ago for $1,550 is also in this herd. She was at one time the highest producing cow in Waukesha county and now is the second cow in the production for one year.—Adv.

Durocs at Pagel's.

GEO. PAGEL, Zumbrota, Minnesota, has some sixty-five spring pigs, most of which are doing very nicely. His good boar, H. C. Wonder, has made a good growth since he was shown last year and is a better boar now than he was then. The pigs by him are good. The best litter on the farm is sired by the grand champion, Big Wonder. He also has a good litter by Investor out of a High Model dam. Pagel has a good herd of sows and has a nice "layout" for a hog farm. He may hold a sale in October and sell boars and gilts at that time.—Adv.

Future Prospects.

WITH this issue of The Wisconsin Farmer, John North is before our readers again, offering heifer and bull Holstein calves. They are from two to ten months old and are sired by Jewel Aaggie Alcartra 143923, who is out of a twenty-one-pound three year old. By the way, this cow will also be offered for sale and she is worth investigating. The young stuff that is for sale is nicely marked and are being priced to sell. Write John North, Kilbourn, Wis., for details and please mention The Wisconsin Farmer.—Adv.

Drake & Son for Short-horns.

WITH the number of Short-horns owned and raised by H. B. Drake & Son, Beaver Dam, Wis., they are at all times in a position to supply you with bulls or heifers. They have some good cattle, Scotch and Scotch topped and the herd is headed by a good Whitehall Sultan bred bull. If you are in the market for Short-horns write H. B. Drake & Son, Beaver Dam, Wis., and please mention The Wisconsin Farmer.—Adv.

Villager-Bred Bulls.

VILLAGE MYSTIC, the Short-horn bull at the head of the C. J. Schoenfeld & Son herd, is a son of the noted Villager. This firm has some very likely young bulls for sale sired by Village Mystic and some of them are out of Scotch cows. Their address is Fox Lake, Wis., and if you want cattle of this breed write for further description.—Adv.

Buy Bull Calves.

GEORGE A. WILSON, Neillsville, Wis., makes a specialty of selling Holstein bulls as calves. At this age they come very cheap and the express rate is not noticeable. They are sired by a well-bred bull and out of good-producing registered cows. If interested write and mention this publication.—Adv.

The Short-horn Grows in Favor.

IT doesn't require an extensive inquiry among farmers and cattle breeders of experience before one is impressed with the additional weight of 100, 200 or 300 pounds which the mature Short-horn possesses. The Short-horn not only has greater scale, but a superior quality of flesh, and its docile temperament and adaptability to all conditions commends the breed to farmers, feeders and ranchmen everywhere. When the value of the Short-horn calf is added to the returns from the mother's milk, it is evident that Short-horn cows are making dependable and profitable records in the dairy. When Short-horn steers repeatedly top the market at all the leading packing centers, and Short-horn cows are making milk records of from 10,000 to 16,000 pounds for one lactation period, no argument is necessary to further establish the merit of the breed. A leading packer-buyer recently stated that the quiet temperament of Short-horns was an important factor in their killing qualities and one that is not overlooked by the skillful buyer. Breeders of Short-horns are being encouraged and aided by the American Short-horn Breeders' Association which offers $50,000 in cash prizes at the 1917 fairs and shows. By this generous appropriation breeders are encouraged to put their cattle in condition and claim a share of the prize money, and the added prestige from the winning of prizes gives an increased value to the individual animal and to the herd which it represents.—Adv.

Shank's Investor.

KEEP in mind the great sale of Duroc boars and bred sows to be held by W. N. Shanks, Worthington, Minn., on August 14th. He will sell 45 head, one-third each of spring boars, fall boars and bred sows. There will be five boars of spring farrow that were sired by Pathfinder and the others will be by Investor. Let us again remind you that Investor is some boar and some sire. Buy one of his sons and you will not make any mistake. Those looking for a Pathfinder boar will be given a chance to buy one at their own price—Mr. Shanks never sets the price on anything in his auction sales. All of the sows included have been bred to Investor—come and take your choice. Plan to be in Worthington August 14th. Announcement later.—Adv.

Extraordinary Herd Boars.

WE are still of the opinion that P. W. Young, Prosper, Minn., has three of the best Poland China boars to be found in one herd in America. The blood of these boars will add prestige pound boars with quality of a medium type. If you want boars of this caliber get his boar sale list or private catalog. to your herd. You don't want to sacrifice quality to get them big—neither does Young. He can show you 1,000-Address P. W. Young, Box 100, Prosper, Minn.—Adv.

SOME mighty good bargains in registered Galloway cattle are being made by C. S. Hechtner, Chariton, Iowa, on page 25. He has a splendid lot of cows and heifers for sale and some splendid young bulls. Among the cows that he is offering are some that are show cows and some that are imported. Mention this paper when writing him, but go and see him if possible and go as soon as you can —Adv.

THE MARKETS.

Union Stockyards, Chicago, Ill., July 21st.—Corn-fed beeves, not as prime as the $14 bullocks of last week, turned the $14 notch here this week, a load of 1,200-pound two year olds touching $14.05, while a three-car string of heavy 'stillers scored $14. Both are new record prices and the distillery feds sold against an extreme top on the class of $10.95 last year. Demand for beef must be enormous, otherwise current prices would be impossible. In a numerical sense there is no shortage, as cattle receipts at western markets are running several laps ahead of the same period last year, but empty corncribs mean light weights and deficient quality. Values of corn-fed steers are constantly working higher and there is confident prediction of a $15 market this side of the Christmas holidays. Even grassers are doing a creditable stunt. Killers' needs appear insatiable and growers are responding by gathering cattle everywhere.

Sizing up the cattle market situation, the trade feels that it is logical to expect a rather liberal movement of grass cattle in the aggregate throughout the summer and early fall, but an abnormal demand situation sufficient to cope with it and hold the market to high levels. The generous needs of the United States and allied

governments for beef to supply their huge military forces and the civilian populations, the unprecedented demand for labor, the high prices being paid for that commodity and the extremely high prices current for hides, skins, etc., pressage a healthy cattle market and highly remunerative prices for the live stock producer and feeder right along.

Packers have been a bearish set in the hog trade this week and up to the close yesterday had succeeded in breaking values 40@50c from prices current a week ago. Sentiment in the hog trade is somewhat mixed. Although the June run of hogs was the smallest for the month, with a single exception, within 25 years, no one doubts that the country has a very sizeable quantity of pork in the making up its capacious sleeve, and with the hog market attractive and feed so high, it will, say the bears, keep the market hopper comfortably filled. Fortunately, there is little disease, although occasional sporadic outbreaks of cholera are reported. "One thing is certain," say those who favor the bull side of the situation, "that is that until new corn is available corn will be converted into pork sparingly, and so few choice heavy hogs, comparatively, will reach market, meanwhile that the spread in prices will continue wide, with quality commanding a big and merited premium."

Viewing the shortage in sheep and lamb supply, both present and prospective, as guaged by normal marketings, the lofty wool market and the broad demand for feeding and breeding stock, trade talent is of one mind in declaring that nothing vended in the sheep house this summer or fall can possibly be cheap in the accepted sense of the word. Feeders have paid up to $15.50 for good Idaho feeding lambs here this week, and if packers get very many good, fat lambs below $15.50 any time this summer, many close students of the trade will have to admit themselves false prophets.

Seven western markets have received approximately 190,000 cattle this week, an increase of 40,000 over the week previous and 34,000 more than a year ago, yet prices have advanced under a broad and healthy demand and new record levels on top classes have been established. Middle grades of killing steers have shown the sharpest price appreciation, most of the $10.25@12 kinds closing 35@50c higher than a week ago, while choice to prime bullocks in all weights and the common to fair light grassers are generally 25c up. The big end of the week's beef steer supply has cashed within a range of from $11@13.75. Prime long-fed yearlings topped at $13.95, prime distillery fed steers at $14 and handy weight corn feds at $14.05, with a still higher figure nominally quotable for strictly prime heavy bullocks at the close. Under $11 it has been a market for light grassy steers, a fair showing of feedery and fair fleshed 800 to 1,050-pound steers going for slaughter at $8.50@10.50. The supply of ripe winter-fed cattle left in feeders' hands is very small, the record corn market having drawn cattle out of feeders' hands from six to ten weeks earlier than they otherwise have come and the trade can see nothing but a still higher market for such specialties, although the price spread between them and low-grade steers is now the widest in trade history.

Butcher cattle values have also advanced irregularly this week, the bulk of the fat cows, heifers and bulls gaining 25@40c over a week ago, while canners and cutters are mostly 10@15c higher and veal calves a full 25c up. Most of the butcher cows are now selling between $8@9.50, occasional ripe, heavy kosher cows up to $11@11.50 and a common grass sort, bordering on cutter quality, down to $7.25. Canners and cutters are moving largely within a range of from $6@7, with good meaty cutters up to $7.10@7.20 and shelly old canners as low as $5.50. It is a $7.50@10 market for ordinary grass heifers up to a good killing class showing corn feeding, while choice to prime corn-fed heifer yearlings are quotable up to $10.75@13 and fancy mixed steer and heifer yearlings on up to the top of the baby beef market. Doggy, thin grass heifers, lacking quality to make them appeal to stocker buyers, frequently go as canners at $6.25@6.75. Choice heavy bologna bulls have advanced up to $8@8.75, bulk of the 1,000 to 1,250-pound sausage bulls now selling at $8.10@8.50 and canner and common lights at $6.25@7.50. It is a $9@10.35 market for medium to choice fat bulls, prime dry feds being quotable on up to $10.50@11. Bulk of the good to choice veal calves are making $14.25@14.50, choice odd selected lots going as high as $14.75.

A broader general demand for stock and feeding cattle than has been shown in recent weeks, brought out by excellent grazing conditions and good corn crop prospects, the healthy fat cattle trade and the recent declines in thin cattle values, has featured the week's trading and prices at the week-end are largely 25c higher than a week ago. Breedy 900 to 1,000-pound feeders in light flesh have sold up to $9.50, while a range of from $7.85@8.75 has taken the bulk of the plain to good 600 to 800-pound steers going to the country and only trashy, ill-shaped, light tailings have been available below $7. Now that haying and the harvesting of small grain will soon be out of the way in most sections of the corn belt, demand for cattle for summer grazing is expected to show more breadth and as supplies are not heavy, a healthy trade is in prospect.

CHESTER WHITE SWINE.

Champion Chester Herd of Northwest
SPRING PIGS READY TO SHIP. The best are none too good. Buy or order early.

HOLSTEIN-FRIESIAN CATTLE.

TWO-YEAR-OLD Holstein Bull

A BULL THAT WE GUARANTEE to be right in every respect and just as we describe him or no sale. He is straight, good size, well built, nicely marked, more white than black and throws light-colored calves; whose eleven nearest dams have good A. R. O. records. Sire's dam, Princess Mercedes Riebe at four years made 26.39 lbs. butter and 561.50 lbs. milk; at two years, 667.39 lbs. butter and 17,400.70 lbs. milk for one year. Sire's grandam at four years made 18.23 lbs. butter and 474.10 lbs. milk and 909.91 lbs. butter and 21,611.70 lbs. milk for one year. The dam of this bull made nearly 21 lbs. butter at three years of age; her dam made 16 lbs. butter at two years of age and her dam made 16.60 lbs. butter. If you are in need of a bull come and see this one, or write for a tabulated pedigree and price to Mountain Ash Stock Farm.
J. B. CAIN, Prop. - - - - - - - - - Glenbeulah, Wis.

Milford Meadows Stock Farm

OFFERS FOR SALE a very well-bred bull calf by Dutchland Creamelle Denver Prince (165048) that is better than a grandson of Colantha Johanna Lad and out of Canary Ormsby Johanna De Kol, a 28-pound three year old, 111.95 pounds in 30 days, which is practically a perfect individual. Write for extended pedigree. Other bull calves out of A. R. O. dams by same sire for sale.
EMMONS BLAINE, Prop. Lake Mills, Wis.

KING PONTIAC SEGIS VEEMAN

(134190) IS FOR SALE

A 29.29-Pound Son of King Segis Pontiac Count.

King Segis Pontiac Count is a grandson of King of the Pontiacs, that has more thirty-pound daughters than any bull and is sired by King Segis Pontiac, that has sired more high-priced bulls than any sire.

King Segis Pontiac Count also has the distinction of siring the greatest producing junior two year olds of the breed. He has three junior two year olds that average 28.46 pounds butter in seven days and five junior three year olds that average 31.37 pounds and 610 pounds milk in a week. The herd at which King Segis Pontiac Count stands at the head leads all others in prize winners for A. R. O. work for the year just closing.

For further particulars concerning King Pontiac Segis Veeman write to Edgewood Stock Farm, Burlington, Wis.

Are playing an important part in the development of the Holstein Breed in America. There are over 300 head in this State Accredited herd.

We sell bull calves at a price ranging from $150 up. Send for list.

Purebred Registered

HOLSTEIN CATTLE

To the open minded farmer or dairyman, the results of actual comparative tests of Holsteins with other breeds are striking object lessons of economic investment. The ten largest records of Holstein cows average 1,007 pounds of butterfat and 25,897 pounds of milk in a year. A like number of cows of the nearest competitive breed produced 974 pounds of butterfat, and 18,120 pounds of milk. One good Holstein cow will produce as much as two ordinary cows at a saving in feed and care. There's big money in the big "Black and White" Holsteins.

Send for FREE Illustrated Descriptive Booklet.

The Holstein-Friesian Association of America
F. HOUGHTON, Sec'y, Box 143, Brattleboro, Vt.

A 28.44-lb. BULL

THE ABOVE IS THE AVERAGE RECORD for his dam and sire's dam. His sire is out of the famous 35.43-lb. cow, Pontiac De Nijlander. His dam has a junior four-year-old record of 21.46 lbs. butter in 7 days. She has a 17.50-lb. yearling daughter. The bull is a black, well grown and of exceptionally good conformation. Born November 25, 1916. For pedigree and further information, address
A. M. ANDERSON WHITEWATER, WIS.

Registered Holstein Heifers

HEIFER CALVES AND YOUNG COWS for sale. Ten daughters of the 24.12-pound bull, Sir Korndyke Zoldusky DeKol, that has 10 A. R. O. daughters. He is a grandson of Hengerveld DeKol, that has 116 A. R. O. daughters. These heifers are bred to the 40-pound bull, Johanna King Segis, a son of the 40-pound cow, Johanna DeKol Van Beers. Yearling bulls and younger from A. R. O. dams with records from 14 to 30 pounds. High-grade springers and young cows. Write us your wants.
H. F. McNUTT OXFORD, WIS.

REGISTERED HOLSTEIN BULL

AND heifer calves sired by Pabst Canary Pontiac Champion 142885, and out of well-bred heavy-producing cows. Call and see our herd or write
WM. FENNER Sheboygan Falls, Wis.

HOLSTEIN CALVES

WE OFFER FOR SALE choice, beautifully marked, 15-16 pure-bred heifer or male calves 1 to 2 weeks old, out of heavy-milking dams, $15 each, crated f. o. b. cars. First check takes them. Write **W. C. KENYON & SONS, ELGIN, ILL.**

10 MORE COWS

OPPORTUNITY RAPS at every man's door. Here is a chance to get some fine animals to found a good herd of registered Holstein-Friesian cattle, for a small-sum of money. Cows from $150 to $250. They are bred to Sir Johanna DeKol 19th 64143, a young bull weighing 2500 pounds, with nine A. R. O. daughters, a brother to two world record cows, whose sire has 66 A. R. O. daughters. These cows will soon freshen and their offspring will equal the value of the cows. Also six yearlings to sell at $125 a head. Wire or write immediately, as they are exceptionally cheap.
DR. B. L. WERNER MARSHFIELD, WIS.

23-POUND HOLSTEIN BULL

BORN March 14, 1916. His dam is a 23-pound daughter of the noted "butter fat" sire, Sir Clyde. Her test is 4.23% fat. His sire is a 25-pound son of the 32-pound bull, Beauty Pietertje Prince, and whose dam is the double bred Ormsby cow, Queen Ormsby Duchess. Send for pedigree and price. Address
DOPP BROTHERS Ixonia, Wisconsin

DO IT NOW

GET THIS YOUNGSTER to improve your herd. Bull calf, born April 9, 1917, sired by a son of Pietertje Maid Ormsby 35.56 from a 22-lb. three-year-old granddaughter of King Segis. Calf is nicely marked and well grown. Will send pedigree and picture upon request.
N. DICKINSON & SON,
WALCOWIS FARMS, LAKE GENEVA, WIS.

RUST BROS.

OFFER the richly bred Holstein bull, Sir Isa Lotta Hengerveld 188663, born Aug. 18, 1915. Ready for service. His dam, Ida Lotta Hengerveld, at 3½ years made 21.34 lbs. of butter in 7 days, 31 days after calving. She is from a long line of heavy producing ancestors, records of her three nearest dams averaging 27.20 lbs. butter in 7 days. She has inherited this heavy producing ability, and transmits it. Sire of bull for sale is Daisy Johanna 5th, 1st prize two year old at Wisconsin State Fair, 1915. His dam has two A. R. O. daughters. Arthur Rust, West Allis, Wis.

THE WISCONSIN FARMER

VOL. XLVI. NO. 31. THURSDAY, AUGUST 2, 1917. WHOLE NO. 1853

Takes Good Care of His Cows.

C. H. Brugger, of Fond du Lac County, Spent Considerable Money on Dairy Barns and Ventilation But He Believes It Is Worth While.

THE first thing C. H. Brugger, of Fond du Lac county, decided upon when he bought his present place of 200 acres some five years ago was that dairying should be the chief enterprise. In order to eliminate once and for all the question of properly housing his future dairy animals, Mr. Brugger immediately decided to build a barn that was big enough to take care of any increase in his dairy herd for years to come. The dairy barn which, to his mind, would best meet the requirements of the future cost him a considerable sum of money, but it had in it every idea which he thought necessary to successfully carry on the work of milk production.

The main barn is 165 by 36 feet and runs east and west. It has on each side eight double windows 2x4 feet, allowing plenty of light during all kinds of weather. Sixty-nine cows can be stanchioned in this barn, with plenty of room left behind the cows and in front of the mangers to move about with the feed wagon and the manure carrier. At the east end of the barn two monster silos 16x39 empty into the alleyway. Leading off from the aisle at the east end on one side is the milk room with its gasoline engine and cream separator. The engine is also used to furnish the power for the milking machine. On the other side of the aisle opposite the milk room is a feed room where feeds can be stored and mixed for the herd. Above this feed room, but extending the width of the barn, is another feed room which will take care of several carloads of feed at one time. All the rest of the upstairs is available for storing hay and straw for the herd. The hip roof on the barn gives an added amount of space. The loft is big enough to take care of the entire season's supply of hay and bedding.

MODERN DAIRY BARN ON C. H. BRUGGER FARM, FOND DU LAC COUNTY, WISCONSIN.

Attached to the barn on the eastern end is the section for the box stalls and calf pens. This is 28x68 and of half the height as the main barn.

The lumber used in the building of the barn is northern pine lumber for the outside, while inside the cow barn, feed and milk rooms are finished off with Georgia pine. The barn is well ventilated on the King principle and contains all modern conveniences, as sanitary stanchions, manure carriers, cement floors and gutters and running water. Wires for the electric lights have already been put in and will be attached to a power system in the near future.

Mr. Brugger did not begin his farming with the many years of experience behind him that his neighbors enjoy. He was not even raised on a farm. His only experience previous to buying this place was when he ran a grain farm from his city desk with the help of his brother. In laying the foundation for his dairy herd Mr. Brugger went at it very slowly and deliberately. He purchased most of his stock as calves and developed them into good milkers. For several years he attempted to operate his farm over the telephone, but he finally discovered that it requires the personal touch of the owner in order to make a farm a success. Though he did not know very much about the practical part of farming, and as he now jokingly states, "It took a year to learn the trade and I am still learning," he pitched in with honest enthusiasm from the very start. "I have always liked farming," said Mr. Brugger, "and I will continue to like it with all its hard work and worries." It is Mr. Brugger's plan to develop a herd of Holstein cattle of big type and high-producing qualities. The sale from surplus animals during the last year has proved in a big way the possibility of such an establishment. Cattle buyers from every part of the United States visiting Wisconsin have found Fond du Lac county a good place to buy and Mr. Brugger, like others, found that there were not enough Holsteins to go around. He has now about sixty head, young stock and all, but his plan is to increase his herd until he can have fifty cows milking all the time. His milking machine will milk twenty-five cows in an hour and a half with three units working and two men following up the machine and tending to the milk. Additional units can easily be added to take care of fifty cows in the same time with the help of another man.

Though it is the intention to place the entire herd under official test with the Holstein association, Mr. Brugger nevertheless decided to join the cow-testing association in order to do both himself and the association some good. At the last month's summing-up nine of his cows, though they had been on milk since last fall, tested over forty pounds of butter fat for the month.

But if Mr. Brugger believes in a good home for his cows, he also believes in a good home for his family. His farm house is exceedingly well built and includes all the comforts that are the city man's and provides many advantages which the city cannot equal. It is airy, light and unique in its appearance. Like the barn, it cost Mr. Brugger considerable money to build it, but he is satisfied. Mr. Brugger believes that the comforts of a home are worth a little extra money and life is pretty short at best.

INTERIOR VIEW OF THE MAIN COW BARN ON THE C. H. BRUGGER FARM

The Wisconsin Farmer does not at any time advise its readers to spend money for improvements above what their income will warrant. At the same time it is too often the case that a good barn or a good home is looked upon as an expense rather than a permanent investment and we should take into the consideration the years of dividends which such good substantial improvements on the farm will bring. It is not just what we can make out of the barn, or just the cost of the new home as compared to the receipts of one year or even two or three years. The expenses of permanent improvements should be spread over the period which the improvements will serve the owners of the farm.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

Questions and Answers.

Steel Piston Rings.

Have steel piston rings in gas motors been found as satisfactory as rings made of gray iron? If not, why not?

Answer.—Steel piston rings are not a success. A cast iron ring wears better in a cast iron cylinder than a steel ring, as the surface of the cast iron ring soon acquires a smooth glaze, while the surface of the steel ring does not. The exhaust gases also corrode the steel ring more than the cast iron ring.

Running on Acetylene Gas.

Please tell me in the Farm Mechanics Department whether an engine would run if the gas from carbide and water is turned on the spark plug as it sparks, and then turned off automatically? If a cylinder is two inches diameter and has a three-inch stroke how much power has it? How many batteries would be required? Would a gas pipe or steam pipe be smooth enough for the cylinder?

Answer.—A gas engine will run on acetylene—the gas formed from carbide and water—but the acetylene cannot be admitted in an instant and it must be mixed with the air in the cylinder before it will explode. It would be possible to make an outfit to admit the gas during the intake stroke. The above size of cylinder should develop one-half horse power. At least four dry cells should be used for ignition. Gas or steam pipe is not smooth enough for a cylinder. A cylinder must be very smooth and round to hold compression, and cast iron makes a better cylinder than wrought iron or steel. There is a certain amount of graphite in cast iron that acts as a lubricant. Steel pistons have not been very successful.

Engine Speeds Up.

I wonder if you can advise me how to repair my gasoline engine. It is mounted on a truck, and is used mostly for running the washing machine, feed grinder, and other light work. Lately it takes spells of speeding up every little while. It runs well until it warms up, and then it will speed up until the truck bounces. After a little while, it will stop firing and then catch itself and run all right. In a few minutes it will speed up and repeat the performance. It often speeds up to such an extent that before I can get from the washing machine to the engine, it will have bounded so hard that the connecting wires on the batteries are broken.

Answer.—If your engine has a governor, some of the governor parts may be sticking. You may be feeding too much fuel through the needle valve, due to opening it too wide, or the needle valve may be worn, the hole being so large that the fuel supply cannot be properly regulated. If there is a pocket in the bottom of the intake where the gasoline can settle, the gasoline may be collecting in the pocket for awhile, and then, being carried over with the air, cause the motor to speed up. If you have a carburetor, a sticky float valve could cause the trouble. It might be that the rings of your motor are worn out, allowing too much oil to work up past the piston. This would make the ignition uncertain. The motor might fire good for a time and then, when the spark plugs become drenched with oil, the plugs would cease to fire until the oil drained off. A blue smoke from the exhaust indicates too much oil. A black smoke indicates too much gasoline.

Running Washing Machine From a Ford.

I saw in your paper that a washing machine could be run from a Ford car, and that is just what we want. Is an eight-inch pulley the right size, and how can it be fastened to the wheel? Does the car or the machine have to be fastened down solid? Could the car be used to pump water from a well 125 feet deep, and what size cylinder should the pump have?

Answer.—Your washing machine should run about 70 R. P. M. If it has a twelve-inch belt pulley use a four-inch or six-inch pulley on the rear wheel of the Ford. The pulley will be more easy to attach if made of wood. The pulley may be made in halves and clamped on the hub and hub cap of the wheel, or two bolts may be removed from the hub flanges and longer bolts used to clamp the pulley against the hub, or two or three holes may be drilled and tapped in the hub flanges and the pulley fastened on by means of cap screws.

The weight of the machine will hold it down. The car should be blocked at the front and one rear wheel should be jacked up—the wheel to which the pulley is fastened. As the power required to run a washing machine is very small, no injury should result to the car. The car should not be used in this manner for heavy work. The car should be used in the same manner for pumping water, using an ordinary pump. A power pump requiring not over four horse power could also be used. While the motor will deliver over twenty horse power, the drive is through the differential gears when the car is used as above and these gears will not stand a heavy load continuously.

Making a Cycle Car.

I would like to know if it is practical to make a cycle car like the enclosed sketch, using a nine-horse-power Harley-Davidson motorcycle engine. Would it work to have a friction slide on a square shaft for a clutch? What kind of differential should I use? How large chain wheels? Would it do to have the friction wheel made of two thicknesses of board, faced with sheet iron?

Answer.—In the figure, E is the engine, U a universal joint and S the drive shaft, one end of which carries the iron or steel disk, D. This disk is keyed to S and held in place by a set screw. It would be better to have

shaft S arranged to slide endwise a small amount with a spring behind the disk to hold it up against the friction wheel with an even pressure. F is the friction wheel, sliding on the square shaft, A, the shaft being turned round at the bearings. B is a small sprocket wheel fastened on shaft A. C is a large sprocket wheel, fastened on the rear axle. There should be about three times as many teeth in C as in B. G is a drum on the rear axle. A leather strap around this drum may be used as a brake. H is a ratchet hub on one of the drive wheels, which takes the place of the differential. The drive wheels are bicycle wheels twenty-four inches in diameter. Motorcycle wheels would be better.

This outfit should work successfully. The weight of the machine comes on the drive axle, which is not very good, but in this case it will work if the axle is strong enough not to bend. The rear axle bearings should be roller bearings with dust-excluding caps, though a babbit bearing will work if kept lubricated and protected from the dust. The friction wheel, F, should not be made of wood. Make it of pasteboard. Heavy pasteboard, known as binder board, makes a very good friction wheel. The pasteboard should be clamped between the flanges of an iron hub, about half an inch of the board extending beyond the flanges of the hub.

Adjusting Carburetor.

Please tell me how to set a Model G1.3 Bayfield carburetor on a Model 38 four-cylinder Auburn car for speed.

Answer.—The high-speed adjustment is the knurled nut at the top of the carburetor near the intake manifold flange. For more gasoline turn this thumb nut to the right. Turn the nut a little to the right and note the effect on the running of the motor at high speed. If the running is not affected, turn it a little more to the right. You will soon discover which way to turn the nut to get the best results. Do not turn the nut very far without trying the motor and noting the effect.

ALLIS-CHALMERS

FARM TRACTOR

175 Acres in 115 Hours

THAT'S the remarkable record that was made by this Allis-Chalmers Tractor, pulling a two-row lister with planter attachments in wheat ground near Downs, Kansas, last spring. The tractor ran continuously for 122 hours, with the exception of about 7 hours lost in changing crews, taking fuel, oiling and filling grease cups. A total of 175 acres was listed and planted—a little better than 1½ acres per hour, at a total cost of 33 cents per acre, including oil, fuel and help. No water was added to the radiator from start to finish. No wrench was used on the tractor from start to finish.

The Ideal One-Man-All-Purpose Tractor For The Average Size Farm

The Allis-Chalmers has a one-piece steel heat-treated frame—no bolts or rivets to work loose—cannot sag under heaviest strains. Allis-Chalmers motor bearings never get out of line through frame weakness.

The special design radiator insures perfect cooling under all loads. No Allis-Chalmers Tractor ever overheats.

Perfect balance of all reciprocating parts minimizes vibration, thereby insuring long life.

No dust or grit can possibly get into bearings or vital parts—the tractor is absolutely dust proof.

It is easy to get at every part. When valves must be ground or bearings taken up, no time is lost.

Either gasoline or kerosene is used with remarkable economy and efficiency.

The special design of the belt pulley makes the Allis-Chalmers particularly strong on belt work—silo filling, sawing, feed cutting, pumping, grinding. Long bearings of large diameter maintain perfect alignment.

The buyer of this tractor has the Allis-Chalmers guarantee, backed up by the great Allis-Chalmers organization, for 60 years a leader in the manufacture of high-grade machinery—ask your banker.

Tear out this advertisement, write your name on the margin and mail to us for complete illustrated description and specifications of this remarkable machine, with particulars of its four years record in the field.

THURSDAY, AUGUST 2, 1917.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

A STEP NEARER OUR GREAT ARMY.

WE ARE a step nearer to having a great national army in the field than we were a fortnight ago. The drawing took place at Washington without any mishap or untoward incident. The daily papers have printed the numbers in the order they were drawn, so that practically every young man who registered knows whether he is drafted for the first, the second or the third army, and so on. In case any of my young readers have not seen their numbers and do not know the order in which they will be called before the local exemption boards, I suggest that they get in touch with their local newspapers or see their county sheriff, who will probably be able to show them the list or answer their questions, at least.

The next step in forming our big, million-strong national army is to summon twice as many young men (in the order in which their numbers were drawn at Washington) as may be needed, to appear before the local boards for physical examination and possible exemption. Twice as many as are needed will be summoned, on the theory that every other man will be found either physically deficient or entitled to exemption as the sole support of a dependent wife, mother or father or as a worker in field or factory so important that he cannot be spared to don uniform and fight with gun and saber. I regret exceedingly to see that some small-caliber politicians have been appointed on these local exemption boards, while the physicians appointed are not always of the first rank. I can only hope, however, that they will do their work faithfully and well, so that no man finally drafted into the army will have any reason to feel that there was anything unjust or unfair about his selection.

As I have pointed out before, the jurisdiction over farm laborers rests entirely with the district exemption boards, the local city and county boards having absolutely nothing to do with this. The president has appointed the members of these various district boards (one each in Kansas, North Dakota and South Dakota; two each in Wisconsin, Minnesota, Missouri, Oklahoma, Nebraska and Iowa, and four in Illinois), in practically every case following the recommendation of the governors of the states. I am glad, indeed, to see that farmers are given representation on practically every one of these boards, throughout the entire grain belt. Thus in Iowa, acting on the recommendation of Governor Harding, the president has appointed Mr. E. M. Cassady, of Whiting, a member of the board for the northern district, and Mr. Harry Hopley, of Atlantic, for the southern district. Both are farmers of the most progressive and successful type, men who may be relied upon to consider the farming needs and to order exemptions where they know farm work will be delayed or hindered by the drafting of farm boys. Practically the same situation exists in the other states of the grain belt. I am glad, indeed, that this is the situation, for it makes it easier for me to answer the scores of touching letters which come to me daily from grain-belt farm mothers, who tearfully ask for a farmer to decide the farm boy's fate and not to leave him to the mercies of city men who do not understand the situation. I am in receipt of dozens of letters similar to this one, from a devoted "mother in Israel" whose sorrowing heart can be felt in every word of her tearful appeal:

Dear Mr. Pierce:—As I am a reader of your good paper I just couldn't keep from writing you on the war, as it is most important to me, having three sons that had to register for the draft. As I am a poor widow woman with no one to advise me about this exemption, I would like to have you help me all you can to keep my boys at home. They are all farmers and they do their own work and help other farmers, so they are busy all the time. So please help me all you can.

I see what someone wrote you about membership on the exemption board. Do your best to have some good men put on; some farmers, for help is scarce here now and if my boys are taken what will they do with their crops? Doesn't the governor live where you do, don't you know him well? Please see him about it and do your best and God will reward you, I am sure. Oh, if Wilson hadn't got us into this awful war, how much better it would have been. I don't think he had any business to get us in. He could have made England and France loans of money and that would have done; then they could fight it out themselves.

Now please do all you can for me and please write me at once, for I can't endure this worry much longer. One of my sons is talking of going some place to harvest. Is this all right, as harvest will be late here now. Please write and tell me right away. Now please let me hear from you, for I am nearly crazy about it all. Now please do all you can and let me know if you will write and help me.

You can readily realize that such a letter as this touched me deeply. I am glad to be able to report that this woman lives in a district where a splendid farmer has been named on the exemption board. If her sons are called, he will surely see to it that they are allowed to remain with her and the harvest fields, which need them so badly.

LOANS RUN $800,000 A DAY.

I AM advised from Washington that the federal land banks of the country are making loans to farmers, at 5 per cent annual interest, at the rate of $800,000 a day. Up to the close of business July 13th the Federal Farm Loan Board had chartered 432 farm loan associations, whose loans aggregated $20,699,337. These associations have an average membership of eighteen farmers each (they must have at least ten) and the average loan to the individual farmer is $2,250.

This report would indicate that the new system is now in smooth working order and that the farmers are quick to take advantage of this opportunity to secure money from Uncle Sam for a long time and at a low rate of interest. By next spring, when the great majority of farm loans are either made or renewed, the applications should be many times what they are now. Farm loan bonds are being issued to secure the necessary capital for these land banks and altogether the plan seems to be working out well.

I am still hopeful that within a short time some provision will be made which will enable the farm tenant to forge ahead and to get hold of his own place more quickly than it is now possible to do.

THE FARMER'S DEBT.

I WAS HARDLY prepared for the avalanche of letters resulting from the publication of the one from the Wisconsin farm woman struggling to get out of the tenant rut. Some offer situations, others advice. All are interesting; practically all are valuable. I have forwarded many of them to the woman whose letter started the discussion, in the hopes that out of the correspondence there may come at least a ray of light to lead them into easier paths.

I wish I had the space to print all the letters, but that is utterly impossible. This week I am going to print two which interest me particularly, because they deal with one phase of the subject which is most important: Is it advisable to go into debt in order to get out of the rut, to get ahead in the world? One of my correspondents says "Yes" most emphatically; the other answers "No" equally positively. Before I give my opinion, let me print the two letters. Here is the one advocating going in debt. It was written to me by Mr. H. H. Kesler, of Bedford, Missouri:

I think I can answer the letter in your article "Getting Out of the Rut." First, is this man honest? He is not, nor has he been, in debt. Some men cannot get in debt very deeply because they are not trusted. Now I will tell how I started from a hired hand. This is what these folks will want to know.

I was working for $16 per month. I worked six months and saved $53. I took that $53, hired a team to put in fifteen acres of wheat, and that winter I worked all I could. About March I bought a span of small mules, mortgaged my two-thirds of the growing wheat and also the mules I bought to secure the mule note. I did hauling for other people until time to plant corn. Then I rented twenty acres of rich river bottom land and raised nearly 1,000 bushels of corn, two-thirds of which was mine. At 35 cents per bushel this would be $350, my part being $333 or thereabouts. Now, my wheat (which did not make very much) and corn paid my mule note, but left nothing but seed wheat and corn for another crop—no money. I had to work for other people for cash money.

After paying for the first two mules I bought two more, mortgaging the four to secure the last two. I put out larger crops and hired a hand. I had to borrow money. Sometimes I paid when due, but most times renewed the note.

Then I bought 124 acres of very poor land, very cheap, but through incorrect deeds I lost twenty-three acres of it. I still own the 101 acres and have picked up little tracts now and then until I have 315 acres of good land, fair improvements, ten head of horses, six mules, forty-three head of cattle and thirty-three head of hogs, besides a tractor, farm engine, corn shredder and a lot of other farm machinery. All this in thirty-two years. I am in debt, of course, but not heavily, considering the value of the property.

Now, Mr. Pierce, tell this man he must be honest as well as a hard worker. He must go in debt. Tell him to save enough to buy one horse or mule, then buy another horse or mule (on time). He can mortgage the cash paid on one to secure the second one. Tell him to rent a small farm, go in debt for a few farming tools and buy more afterwards. He should buy a cow and a few pigs or, if he can, buy a few brood sows, etc. If this man waits until he has cash enough to start farming he will die a hired hand. This is my advice, and advice which I followed myself.

Here is the one against going into debt, with such splendid advice on specializing, on burning the midnight oil in order to get ahead in the world, that in many ways I consider it the best of all the letters received. It was written to me by a woman who desires her name withheld. I comply with her request, although I think she makes a mistake by not sharing her name with all of us here in the family circle. Her letter follows:

My husband is now fifty-seven years old, very broken in health. My health has never been good and I have always worked far beyond my strength, and as we grow older the road gets more difficult to travel. We have been "hired help" most of the years past. For sixteen years my husband was foreman, but never had wages in proportion to the amount of labor and responsibility required and I never received anything for the sixteen hours daily labor. Our boys and girls were denied even a common school education. One girl never went beyond the fifth grade. Five times we have tried to have a home of our own. I inherited from my father a great desire to raise fruit, vegetables and flowers for pleasure as well as profit, and as often as we would have a little saved up we would make the attempt, each time going heavily in debt, thinking we would be sure to "make good" this time. But I begin to think God never intended us to have a home. The first place had to be sold at a sacrifice because of heavy doctor bills and the loss of a valuable horse; the second because we could not keep up the payments and four children in school on $10 per week.

Now we have a beautiful little place of fifteen acres—my ideal home, very nearly—but last year's crop failure has made it seem impossible for us to meet our obligation and so, once again, I am heart sick over the fear that all will have to go. So I wish to say, however badly you want something for yourselves, keep out of debt. It is far better in the end. Educate your children for some special line. That is where that husband and mine have failed. I realized this before it was too late and insisted that my two boys and two girls take up special study nights. Now they thank mother from full hearts for it. Our oldest son, at the age of twenty-six, is a machinist foreman, the next, twenty-five years old, is a mechanical draftsman in Chicago and a Y. M. C. A. man. The girls are working their way through college, making up all their back studies, without any assistance from home. The boys help them when they get in a pinch, which isn't often. Neither boy has ever worked for as low wages as the highest their father ever received.

That husband is not too old to specialize on something. Do it, burning the midnight oil if necessary. It will pay big interest on the investment. I tried to persuade mine to do it years ago, but he just laughed. Now he looks at his successful boys and realizes it was no laughing matter. He can do a lot of things well, but is not an expert at any one of them. If it's nothing but a crop of potatoes, specialize on that crop.

Surely, here is a pro and con discussion which cannot fail to interest every one of us, to have valuable advice for us all. Personally, I have never been afraid of debt. I bought my first newspaper, when a mere lad of twenty, by turning over to the former owner four steer calves, of the value of $20 each, canceling an indebtedness of his of $20, giving my note for $150 due in one year and assuming a mortgage on the plant of $900. When I add that I was obliged to pay 36 per cent interest (payable quarterly in advance) on my indebtedness, you can readily see that I carried a pretty heavy burden for one so young. The fact that in a year and a half I had succeeded in paying off all my indebtedness proves that debt in my case was not too heavy a millstone about the neck of a struggling young man.

Nor have I been afraid of going into debt, in order to get ahead, in later years. I believe that the late J. Pierpont Morgan was right when he said a millionaire is not so much a man who has a million dollars as it is a man who can get a million dollars. One of the largest manufacturers of agricultural implements in the grain belt told me the other day that he would borrow all the money anybody would loan him, that "Mortgage" was his middle name. There are many men like him; they go into debt and then fight an uphill battle until they are out of debt and a little further along the road to fortune.

I wonder what my readers think of this phase of the subject. Will you write to me, giving me your experience and your opinion? Are we justified in going into debt in order to buy more land or more stock, to build better homes and barns, to add a silo to our farms? What do you think? After all, it is your opinion which counts, not mine, on this, as on all other subjects. Will you let me have it, frankly and fully?

County Farm Demonstrations.

County farm demonstrations will be held during the coming weeks as follows: Appleton, Outagamie county, August 17th; Weyauwega, Waupaca county, August 18th; Richland Center, Richland county, August 20th; Chippewa Falls, Chippewa county, August 22d; New Richmond, St. Croix county, August 23d; Reedsburg, Sauk county, September 3d.

At all these meetings a field trip and program will be held which will be of interest to the men and women alike. A. H. Wright, of the college of agriculture, will take care of all discussions on field crops; D. C. Bullock, field man for the Wisconsin Live Stock Breeders' Association, will give a lecture on live stock raising; Nellie Maxwell, of the department of farmers' institute, will give a talk on food and food conservation. Field trips to the plots at each of these stations will be made and the work that is being done at each station will be explained by Mr. Wright and the superintendents of the various farms.

These picnics are worth traveling many miles for and every farmer and his family are well justified in taking a day off in order to visit these county farms and view the experiments that are being carried on.

At the recent meeting at the Wood County Farm at Marshfield everyone present voiced his satisfaction with the work that is being carried on and not only asked questions, but quite a number expressed a desire to have their farm rotations so changed as to make use of the work and the results of the experiment station.

Seeing things is always more convincing than reading about them. Wood county farmers in attendance at that picnic expressed their surprise and satisfaction at the results. They believe the work of the county farm is a real benefit, but they were only convinced of it by seeing the plots with their own eyes.

Aiding in Wisconsin Harvest.

Farmers need help to gather Wisconsin crops. The state department of agriculture, county agents and emergency food agents are doing what they can along this line. In Kenosha county both men and women have enlisted and they have had for two or three weeks an automobile squad taking people to the farms to help in the fields and in canning and otherwise preserving the fruits and vegetable crops. Langlade county also has a flying squadron composed of busy men who are willing to sacrifice less important work to help the farmers gather all the crops. At Colfax, Wisconsin, storekeepers and clerks have been organized on a basis that each man spends a few days in the harvest fields. These helpers will be especially valuable when it comes time to dig the potato crop in the vicinity of Colfax. All these agencies are helpful to some extent. The worst slacker today is the able-bodied man who loafs in town when he is needed in the fields. Every pound of hay in the state, even that along the highways in the portions of our state where clover and other grasses grow wild like weeds, should be cut and saved. Some are predicting that hay will reach a record price this winter. But the main point is that all of it will be needed for feed and good hay saved will release grains needed by our people, our allies and our armies. A talk against wastefulness is not needed so badly in Wisconsin as it is in some other states where farmers have not learned to farm carefully or to save all the crop.

As we have repeatedly said, however, the labor problem is one for the individual farmer. If he cannot get help, as will be true in many cases, he will have to see to it that he, with the help of his family, gets in all the crop. We were talking with one of the wealthiest farmers in the grain belt the other day and he told us that he had offered $5 a day for farm help and couldn't get it. From seven in the morning until eight at night his wife drove the tractor while he handled the binder cutting oats. He told us he has the biggest crop of small grain that he has ever had; that he can't get help, notwithstanding the fact that he needs it worse than he ever did; but he also told us that not a pound of grain or hay will go to waste on his farm. He is one of the kind of men who says "it can be done" and that kind of a man succeeds, obstacles notwithstanding. Appreciating as we do the efforts of town and city folks to help, we still believe that the farmer must depend chiefly upon himself. If one man can get his work done and help another who is in sore straits for help he should do so. Uncle Sam is fortunate, and Wisconsin especially is fortunate, that farmers are not afraid of work.

Wisconsin Farmers' Exemption Claims.

President Wilson last week announced the Wisconsin Federal District Exemption Boards, members of which had been nominated by Governor Philipp as follows:

District board for Division No. 1 of the western district of the state of Wisconsin comprising the counties of Rock, Green, Lafayette, Grant, Iowa, Dane, Jefferson, Columbia, Sauk, Richland, Crawford, Vernon, Adams, Juneau, Monroe, LaCrosse, Buffalo, Trempealeau, Jackson, Wood and Portage:

John C. Gaveney, lawyer and farmer, Arcadia, Wis.

C. F. Burgess, engineer, Madison, Wis.

Richard Meyer, Jr., banker, Lancaster, Wis.

W. W. Gill, doctor, Madison, Wis.

J. A. Craig, manufacturer, Janesville, Wis.

District board for Division No. 2 of the western district of the state of Wisconsin comprising the counties, Pepin, Pierce, St. Croix, Dunn, Chippewa, Eau Claire, Clark, Marathon, Lincoln, Taylor, Price, Rusk, Barron, Polk, Sawyer, Washburn, Burnett, Iron, Ashland, Bayfield, Douglas, Vilas and Oneida:

Guy J. Johnson, labor representative, Eau Claire, Wis.

A. H. Wilkinson, banker, Bayfield, Wis.

D. W. Woodworth, doctor, Ellsworth, Wis.

Geo. B. Skogmo, lawyer, River Falls, Wis.

W. B. Heineman, lumberman and farmer, Wausau, Wis.

District board for Division No. 1 of the eastern district of the state of Wisconsin will hear claims from registered men from the city of Milwaukee only:

George Lines, attorney, 711-16 Pabst Bldg., Milwaukee.

C. H. Stoddard, doctor, 508-10 Goldsmith Bldg., Milwaukee.

Chas. H. John, manufacturer, Wisconsin Motor Mfg. Co., Milwaukee.

Max W. Babb, vice president Allis chalmers Co., Milwaukee.

Fred H. French, patternmaker, 957 39th St., Milwaukee.

District board for Division No. 2 of the eastern district of the state of Wisconsin comprising the counties Kenosha, Racine, Walworth, Waukesha, Ozaukee, Washington, Dodge, Sheboygan, Fond du Lac, Green Lake, Marquette:

George Harrington, farmer, Elkhorn, Wis.

Grove Harkness, doctor, Waukesha, Wis.

A. J. Horlick, manufacturer, Racine, Wis.

Chester D. Barnes, lawyer, Kenosha, Wis.

Harry W. Bolens, manufacturer, Port Washington.

District board for Division No. 3 of the eastern district of the state of Wisconsin comprising the counties of Waushara, Winnebago, Calumet, Manitowoc, Kewaunee, Brown, Outagamie, Waupaca, Shawano, Oconto, Door, Marinette, Langlade, Florence, Forest:

John Strange, manufacturer, Neenah, Wis.

Frank Durham, farmer, Wautoma, Wis.

John C. Thompson, attorney, Oshkosh, Wis.

Robert E. Minahan, doctor, Green Bay, Wis.

Florian Lambert, labor representative, Oshkosh, Wis.

By the time this paper reaches our readers announcement will have been made as to the time and place of meeting of these boards. Our readers subject to draft will have first received notice to appear before the local boards. They will be examined as to physical fitness before the question of exemption is taken up. The matter of exemption on account of industrial pursuits, including agricultural, will be passed upon by the federal district exemption boards herein above named. This class of exemption does not come before the local board. Exemption claims on the ground that someone is largely or wholly dependent for support on the person drafted or on physical grounds are being taken up all over the state by local boards. Appeal may be made from the local boards to the federal district boards and the decision of the federal district board is final. Exemptions claimed by reason of agricultural pursuits may be appealed from the district boards to the president, but the president announces he will act only upon recommendation of the war department. No appearance in person will be made before the federal district boards. Claims will be made by affidavit. All such affidavits must be filed within five days after claim of exemption reaches the district board. Proper forms may be had at local or district boards. In case any local board does not have the required printed forms, the correct wording for such form may be secured from a pamphlet, copies of which are in the hands of all local boards. Any man found physically disqualified for army service will be given a discharge certificate by the local board and this closes the case so far as he is concerned. In cases where exemption claim is sustained by either local or district board certificate of discharge will be issued. If the decision is against the claim the applicant for exemption will be so notified. The government will notify all those who are finally accepted for service when it is ready to receive them.

Discharges on account of exemption are conditional upon the applicant remaining in the kind of service upon which he claimed exemption. In other words, if a man is exempted because he is a farmer and he ceases to be a farmer he loses his exemption rights. The district boards have the power to withdraw or modify discharges at any time they consider the circumstances warrant. Those who are physically fit, free of dependents and whose presence at home is not essential to our national existence, will become members of Uncle Sam's new armies. It may be depended upon that none but actual workers will be exempted on the claim that they are needed on farms.

Apply for Seed Now.

At the millers' convention at Neenah the bankers' association, through its representatives, Burton M. Smith and Geo. D. Bartlett, offered to assist the millers in distributing the seed of the high-yielding and better milling wheats and rye for next year's crop. It was decided that the first 100 bankers applying for seed should be provided with from thirty to forty bushels each of what seed there is available of the Pedigree No. 1 rye and the Turkey Red types of wheat.

The seed supply, however, will be limited. It is safe to say that of these proven varieties no more than 5,000 bushels will be available for seed. If you are intending to sow wheat or rye this fall apply to your banker at once and secure from him a promise to reserve for you some of this seed. The price will not be placed too high. The object is to distribute the seed among as many farmers as possible and to place it where it will be of value. The first 100 bankers that apply will receive the seed. If you do not ask your banker to apply for seed he probably will not do so, or he will do so when it is too late. It is a question of getting in on the ground floor. You can only do so by acting at once.

Wheat will bring a good price in 1918 even if the war should end tomorrow. The world needs wheat and will need wheat from America next year as well as this. There is a strong possibility that in the near future the government will assure the farmer that his crops, and wheat especially, will not be sold at a loss, but will be bought at a fixed minimum price sufficient to reimburse the grower under all conditions for labor and money invested.

Drying Fruits and Vegetables.

Pointers on Important Method of Conserving Food---By Domestic Science Instructors University of Wisconsin,

DRYING is an old and satisfactory method—thoroughly tested by our grandmothers—of preserving a variety of fruits and vegetables for winter use. It saves storage space, sugar and containers, which is especially important at this time.

At the present time when an increased amount of food is being raised for future use, it is important that it be preserved in the most economical way. Drying requires neither sugar, spice nor special containers. Under the proper conditions, foods so preserved can be kept indefinitely.

If the supply of canning containers is limited, drying is a good method of saving the surplus.

Preserving foods by drying may be done in these ways:

By sun drying—Spread the prepared food in wire or netting trays, cover with netting to keep the food from insects, and dry in the open air. This method is useful in dry, hot weather.

By artificial heat—in the oven or a special drying apparatus—When drying food in the oven, place it, properly prepared, on clean platters, dripping pans or trays. Leave the oven door open during the process. Rapid ventilation is essential to success.

By an air blast created by an electric fan.

By combining any of the above methods. Many find it desirable to start the drying process in the oven and complete it in the sun.

TEN RULES FOR DRYING.

1. Use good material. Food selected for drying should be in the same condition as that selected for immediate table use.
2. Work rapidly. All foods and vegetables should be dried as quickly as is consistent with good results.
3. Slice large foods to get more drying surface—Small fruits, vegetables, some berries, mature beans and peas and small onions may be dried whole. Larger fruits and vegetables should be cut so as to expose more surface for drying. The usual way of doing this is to slice them.
4. Do not overheat—If the food is to be dried in the oven, the temperature should not be too high, otherwise the food will cook rather than dry. Use low heat throughout the entire process. At the beginning the oven should be somewhat cooler than later. The temperature should never exceed 140 degrees F. The use of a thermometer helps to avoid overheating. By placing a cooking thermometer through two corks in which holes have been made it may be kept in the oven while the food is drying.
5. Be sure food dries evenly—Food should be stirred frequently during the drying process. This prevents overheating and the growth of molds.
6. Keep food free from dirt and insects—Foods dried out of doors must be protected from flies and other insects. Mosquito netting or cheese cloth stretched on frames may be used. Always be careful to avoid dust and insects.
7. Watch dampness—Do not allow food to become damp during the drying process. It is better to bring food which is being sundried indoors at night.
8. "Conditioning"—All food should be thoroughly dried before it is stored. It is best to allow it to remain in a dry place for several days, turning it frequently in the meantime; this permits more complete and effective drying. The process is technically known as "conditioning."
9. Storing dried food—Store dry food in paper bags, boxes, tin containers, such as pails, and cracker boxes. These should be kept in a dry place free from insects and moisture.
10. Save the cooking liquid—Soak all dried food twenty-four hours before cooking. Cook in the water in which it has been soaked; allow this to evaporate to small bulk, and serve with the fruit or vtgetable or use in soups or sauces.

Corn—Method 1—Immediately after picking and husking place the ear in unsalted, boiling water for five minutes to set the starch and "milk;" plunge into cold water; drain or wipe with clean towels; cut kernels from cob, being careful not to cut too close to the cob. Use sharp knife. Dry by any of the suggested methods, preferably in the oven.

Corn—Method 2—Husk freshly picked corn, remove tips of kernels with sharp knife or cabbage slicer; extract pulp or "milk" by scraping with a blunt knife; mix thoroughly; partially dry by placing corn pulp in a pan over hot water until mixture thickens. Spread on clean dripping pans or platters; stir occasionally while drying. When thoroughly dry, condition and pack.

String beans—Method 1—Directly after picking, string the beans, wash in cold water, drain on soft paper or towels; cut in one-inch pieces or slice lengthwise. Dry by artificial heat.

String Beans—Method 2—Directly after picking, string and wash beans; plunge immediately into boiling water for five minutes; then plunge into cold water; drain on soft paper or towels; cut into desired form—either one-inch pieces or thin slices cut lengthwise—and dry by artificial heat.

If beans have become too old to use

Drying fruits and vegetables by forcing air across the trays by means of an electric fan.

as string beans, allow them to ripen; then shell and store.

Green Peas—Shell freshly picked peas, steam ten minutes or boil five minutes; plunge in cold water, drain, and dry by artificial heat for six or eight hours.

Greens and Herbs—Spinach, beet greens, lettuce, dandelions and chard supply mineral material and other necessary food substances which may be lacking in the winter diet. As great a variety of these as possible should be dried.

Herbs are also valuable since they

The placing of bricks under the four corners of this homemade drier to be used on the kitchen range permits the free circulation of hot air up through the trays; thus carrying off the moisture.

add variety to the flavor of winter foods. Celery tops, parsley, mint, sage, onion tops, pepper and cress are useful for this purpose.

All greens and herbs should be carefully picked over and washed in several waters. The quicker oven method of drying makes them retain their natural color and flavor better. Only in very hot, dry weather should the sun-dry method be used. Dry thoroughly, condition and pack.

Pumpkins and Squash—Prepare by steaming, boiling or baking; mash and

Another arrangement for the drier over the range—in this case supported by a rope from a pulley attached to the ceiling.

spread on clean dripping pans or platters, and dry in the oven, stirring frequently. Condition and pack as indicated for corn.

Pumpkin and squash may be sliced and dried without previous cooking.

Other Vegetables—All other vegetables, such as carrots, turnips and potatoes may be dried. This, however, should be done only when storing facilities are poor or when the product is to be shipped a long distance. Wash, pare or scrape; cut into one-fourth-inch slices; dry and pack.

Small Fruits and Berries—Small berries, such as blueberries, currants, gooseberries, raspberries and even cherries and grapes can be very successfully dried. The length of time required is from six to eight hours.

Use only sound, unbruised fruit; wash clean and drain on soft paper or clean towels. Spread on clean dripping pans or platters and dry in oven. Be careful that the oven is not too warm in the beginning. A low temperature (100 degrees Fahrenheit) at first will be about right. If this is gradually raised to 130 degrees or 140 degrees Fahrenheit, the best results will be produced.

Berries may be successfully dried in trays in open air where the weather is hot and dry.

Apples and Pears—Wash fruit, pare, core and cut into one-fourth-inch slices. Dip immediately into a weak salt solution made of three level tablespoonfuls of salt to one gallon of water. Drain; spread on trays, dripping pans or platters; dry until somewhat leathery. Condition and pack.

Rhubarb—Select young stems of rhubarb, wash and cut into one-half-inch pieces, using a very sharp knife. If the skins are not removed, the rhubarb retains its pink color. Dry, condition and store.

Higher Yielding Wheat and Rye.

Good Seed and Proper Preparation of Seed Bed and Early Sowing Seem as Important as More Acreage.

"AS MUCH more winter wheat and fall rye as we can raise without injury to dairying, live stock in general, or other profitable farm crops," is the way one of our prominent agriculturists sizes up the situation in Wisconsin. And in our judgment this is about right. It is very gratifying to note the deep interest taken in grain raising by our experiment station officials, by the millers of the state and by the Wisconsin Bankers' Association, and this will all be productive of good results. Wisconsin will increase its wheat acreage, but in all probability increased wheat production per acre will be a bigger factor than increased acreage. To simply adopt the millers' slogan, "more wheat and more rye for Wisconsin," does not necessarily mean that various lines of farming and live stock are to be abandoned and the attention of farmers turned to wheat and rye to the exclusion of other important products.

Wisconsin, according to the estimates, is not feeding herself. The annual consumption of wheat for flour and seed in the state is approximately 16,000,000 bushels. Of wheat Wisconsin produced in 1916 3,700,000 bushels and of rye 6,075,000 bushels or a total of less than 10,000,000 bushels. This leaves Wisconsin 6,000,000 bushels short in supplying her own needs. To raise this 6,000,000 is the object of the various bodies that are coöperating in this campaign for more winter grain.

High-milling and high-yielding winter wheat and rye have long been the object of the Wisconsin Experiment Station. Through the college of agriculture investigations have been conducted at the various county branch stations and at Madison in order to ascertain what strains of wheat and rye will yield the highest and be worth the most for bread-making purposes. This work under the direction of Prof. R. A. Moore and his assistants, E. J. Delwiche and B. D. Leith, has been going on for more than fifteen years. The results so far indicate that both winter wheat and rye varieties possessing the qualities sought for have been developed in the Turkey Red wheat and the Pedigree No. 1 rye.

The Wisconsin Bankers' Association is interested in the production of better-yielding and better-milling grains, and, through their agricultural committee, in charge of Burton M. Smith, of North Lake, will assist in the distribution of several thousand bushels of seed during the coming weeks. Geo. D. Bartlett, secretary of the Wisconsin Bankers' Association, one of the chief speakers at the meeting, called attention to the fact that his association some seven years ago commenced coöperating with other associations in the state to bring about the agricultural superiority of Wisconsin. First by contest in grain growing and then by the distribution of Wisconsin Bankers' Bulletins and by various other means this association has had a leading part in calling the attention of outsiders, as well as the farmers of the state, to Wisconsin's greatness in agriculture. Financial assistance rendered by Wisconsin banks within the last few years has amounted to many millions of dollars. According to Mr. Bartlett, the coöperation of the experiment station, the State Millers' Association, the State Grain Dealers' Association and the 850 bankers belonging to the bankers' association will make it possible to call the attention to Wisconsin farmers to the need of higher yielding and better milling winter wheat and rye in a stronger way than any other combination or organization could do. The members of the experiment station association are already growing these grains. Similar movements for the improvement of barley, corn and potatoes have resulted in increased yields with these crops and the present movement has every chance of being equally successful.

A moving picture story on grain breeding at the Wisconsin station by Prof. K. L. Hatch, of the extension department of the college was run at a local theater.

According to E. J. Delwiche, the sections adjoining to Lake Superior, the red clay belt and the sections in the clay belt of eastern Wisconsin, will grow these winter grains profitably. Drainage and fertility are of more importance to wheat than they are to rye and the seeding dates for winter wheat should not be placed later than the first week in September, while rye can be seeded as late as October 1st-5th.

The hard winter wheats, according to B. D. Leith, rank a very close second to the famous hard spring varieties of the Northwest and Canada. They will make just as good bread, and, while they do not yield quite as well as the soft winter wheats the quality is superior. The Turkey Red type recommended by the station will excel all other winter wheat thus far tried on the station farms. They have tried nearly all varieties of winter wheats at these stations.

Several of the millers testified to the excellency of the milling quality of the wheat and rye recommended by the station. The question of seed will form a difficult problem, as the supply is limited. Nevertheless, it is the intention to charge only a moderate price per bushel.

Badger Dairy Cows Improving.

Conditions Favor Culling of Herds---All Live Stock Healthy---Pigs Are Scarce---Small Grains Look Fine---Pastures Hold Out Well.

WISCONSIN.

Adams County.—With warmer weather the corn crop is showing improvement, but in most cases the stand is poor and the growth three or four weeks late. The crop of tame hay was large, but some of it was damaged. Rye promises a fair crop and will be ready to cut next week. Oats look well except on low ground where they drowned out. Bugs are plentiful. Pastures are good and all live stock look well.—W. B. Barnes.

Brown County.—The last two weeks were cloudy with lots of rain. The corn has been damaged by thunder storms. Potatoes, sugar beets, cabbage and other garden truck were also injured. Wet weather has made haying difficult. Rye will be ready to cut soon. Live stock look well, and the number of pure-bred animals is increasing. Corn is very backward and will have to make rapid progress in order to mature before frost.—J. D. McAllister.

Burnett County.—Many farmers reduced their herds when pastures began to dry up in June. Pastures are now green and rich and cattle show fine condition. Corn and grass crops appear above normal at this time. Corn was held back by cool nights, but is growing rapidly now. Feeding operations show up about the same as usual.—Erick H. Johnson.

Burnett County.—Grain looks fine and the potatoes are the best they have been for many years. Hay made a big gain during the last ten days and will at least be 75 or 80 per cent as large as last year's crop. Corn has grown slowly and needs warmer weather. Live stock are doing fine and the late rains have brightened up the pastures. Garden truck looks fine. Beans are doing well and there will be a production of this crop that will exceed that of last year by 150 per cent.—A. G. Peterson.

Clark County.—Excessive rains, cold weather and cutworms have retarded the growth of corn, making it show about 50 per cent of the usual growth and stand. Warm weather during the past week has improved the fields that were not damaged much and if conditions remain favorable a crop may be secured. Small grains are better than they have been for several years. Meadows and pastures are excellent. Gardens are unusually fine and fruit promises a good crop. Strawberries produced heavily. Live stock are in splendid shape and the herds are increasing in size very rapidly.—Louis Buddenhagen.

Clark County.—All crops look well, except corn which is rather slow. Potatoes and gardens are about the best they have ever been. Farmers are hoping to establish a cow-testing association in this county soon. Many of them haul milk to a local cheese factory.—N. W. Scherer.

Door County.—Cattle look well and all stock prices are high. Plenty of moisture has kept the pasture in good condition. Weather has been too cold for oats Corn is backward and will need plenty of warm weather in the next few weeks in order to mature a crop. Beans look well. The hay crop yielded well. Farm help is scarce. Farmers are helping one another in order to get the work done.—John Aznoe.

Douglas County.—Weather has been too cold to produce good hay so this crop will be short. Small grains and all root crops look well at this time. Corn is not extensively raised in the northern part of this county yet. Potatoes look promising. A number of cows may be disposed of this fall because of the high price of feed. Some farmers are starting in with a few sheep on account of the high prices paid for wool and mutton.—J. N. Ottun.

Buffalo County.—Live stock in Wisconsin are making such progress that we may justly feel proud of the industry. Good milk cows sell as high as $125 a head and more. Many farmers in this locality are beginning to raise pure-bred stock, as they are worth much more. Old corn is scarce and hogs are going to market about half the market weight. Barley has a good color and is just about ripe. Corn is growing nicely since the weather warmed up. New potatoes are fine.—John Wald.

Dunn County.—Live stock have never looked better. Cool weather and abundant pastures have kept them in good condition. Creamery receipts have been unusually heavy for this time of year. The hay crop has been cared for and returns are better than was expected. Farmers in the east are sending dairy cattle to the block and the Middle West must, therefore, grow feedstuffs and raise every good heifer in order to maintain the number of dairy cattle in the country. Grain looks splendid; corn, however, is ten days late.—J. D. Miller.

Grant County.—Small grains look exceptionally well. Weather has been cool, so they are doing fine. Hay is good in most sections. Corn looks well, although it is far from what it should be. The fall weather will have to be very favorable if we get a crop. Gardens and fruit look fine. Live stock are in good health.—A. V.

Green Lake County.—Small grains look better than they did last year. Corn with the exception of being late has a very good prospect. Only a small percentage was destroyed by wet weather. Tame hay looks better than usual and pastures are very good. Fruit, garden truck and potatoes show good condition. Live stock have been doing well and there is a slight increase in the number of them.—G. B. W.

Juneau County.—Corn on lowlands has been damaged by rains. Corn on upland appears normal and compared favorably with last year's crop. Small grain will probably yield 25 per cent higher than the five-year average. Pastures and meadows will rank above last year's condition. Live stock are healthy and normal in number. Feeding is increasing a little. More interest is manifest in dairying lines than formerly. Farmers are culling their herds. Pure-bred stock is coming to the front. —C. E. Haskins.

Lafayette County.—Dairy stock and products are high priced. Milk brings $2.50 at cheese factories. There are few sheep and the pig crop falls below normal in numbers, but seems to be doing well. Barley has been harvested and oats will be ready in a few days. The oat crop will yield heavily. Early potatoes are plentiful and excellent in quality. Haying is nearly finished. Fruit promises well. Pastures show good growth of grass.—W. J. Martin.

Langlade County.—Farmers are raising better stock by using registered sires. All the heifer calves are saved, but the bull calves are disposed of. All live stock is improving, but especially dairy cattle. Butter and cheese are increasing in volume of production—the increase is perhaps 25 per cent greater than last year's total. Young pigs are scarce. All crops look well, except corn. Oats have headed out and barley is in bloom. Rye is well filled. Potatoes look well. Pastures are getting short. —Chas. Lade.

Lincoln County.—Live stock of all kinds are healthy. Dairying is the most important line in this section. Some very good herds have been built up. Holsteins lead in preference. Not much young stock is kept. Pastures are good and some very substantial cream checks are coming to the farmers. One man received more than $500 for the output of June. Pigs are healthy, but scarce. Corn is growing slowly; the crop may not be more than 50 per cent normal. The small grain looks well, but is late. Haying has just started and promises a big crop. Potatoes are doing well. Gardens and small fruit have good prospects.—G. A. Patterson.

Manitowoc County.—All live stock are thrifty. Farmers are turning to dairying on a larger scale than ever before because prices of dairy products are high. Calves were sold off close and there are not many beef cattle. Pastures look fine. Hay promises a fine crop, but the weather is unfavorable for curing it. All grains promise good yields, especially on high lands. Corn is about three or four weeks late on account of unfavorable weather. Garden truck and potatoes are fine.—Edward E. Straka.

Marinette County.—Live stock is claiming much interest among farmers, especially dairy stock. More than 500 cows are tested each month in this section. Five carloads of dairy cows were brought into this locality this season and there is demand for more. The Cöoperative Buying Association is doing good work. Pastures have been good. Prices for milk are unusually high. The number of silos is steadily increasing. Small grains and potatoes are in excellent condition. A remarkably good crop of hay has just been harvested. Corn is behind, but growing rapidly at present.—W. E. Morton.

Marquette County.—Although rains have been excessive no damage has been done to corn. The prospect is more favorable than last year. Small grains are 50 per cent better than last year. Pastures up to the present have been fine. Grass in the meadows is still light, but still grows. Gardens are far ahead of what they were last year. Feeding operations show an increase. —Emil Hein.

Oneida County.—Live stock are in good condition and pastures show up well, but are now getting dry. Flies worry the cows and prevent them from feeding in the daytime. The milk flow however, remains good. Much of the milk goes to cheese factories. Calves are doing well. Farmers are realizing the value of pure-bred stock and are looking for better cows. Holsteins and Guernseys seem to be the favorite breeds in this section. Although the bugs are bad, potatoes are growing fine. Corn has made good progress lately. The hay crop will fall below normal in yield. Small grains look promising. Gardens and fruit promise well.—Chas. H. Jewell.

Outagamie County.—Live stock are in very good condition and many dairy calves are being raised. White scours in calves and bloat in cows caused some loss. Pastures are very good. Hogs are in good health. Horses show good condition, but fewer colts are being raised than usual. There are no young beef cattle. Oats, barley and rye have improved wonderfully. Winter wheat is about 70 per cent normal. Corn looks well, but seems a little backward. Potatoes are very good.—Harry Lepplu.

Sawyer County.—Dairying prospects are improving throughout this vicinity. A number of pure-bred sires have been brought in and also some grade and pure-bred females. While herds are not increasing much in size they are improving in quality. Pastures are very good. The milk production was high until hot weather and flies came. All young stock, both dairy and beef, look fine. Haying is in full swing, but the crop on the average is light and most of it is timothy and alsike clover, because the red clover winterkilled. Grains look well, especially wheat and early oats. Corn is backward and has a poor stand. A few fields on the lighter soils look well. Potatoes promise well at this time.—Jens Uhrenholdt.

Wood County.—Farmers are raising more heifer calves than usual, but fewer steer calves. Most of the unprofitable cows are being fattened and marketed. Thin ones were sold for canners. The prices of milk and cream encourage farmers to keep good milkers. Pastures are improving and the flow of milk is very satisfactory. Hay is late and hard to save on account of rains. Prospects for potatoes and oats are above normal. A good acreage of buckwheat was put in and will yield well. Corn is late, but has improved in growth recently.—P. B.

Winnebago County.—Corn has grown rapidly during July. The weather is more settled and seasonable. Most of the crop is late this year, and makes the prospect poorer than last year. The small grain prospect is excellent, however. Clover, timothy and alfalfa will yield abundantly. Wild hay is not so good. Small pigs are scarce and high priced. Pastures look well and seem to hold out satisfactorily. The apple crop is light. Strawberries and small fruits are promising.—Seymour L. Smith.

More Tractor Experience.

To the Editor:—I am using a tractor, but have had the machine only a short time. I have plowed ten acres with it and that was land which was well cleared. I find that I can do splendid work with this tractor and save a lot of hard work cutting oak grubs and roots. I used a twenty-inch breaking plow with wheel truck and find that I can cut roots, etc., larger than is commonly done with horses. My machine is an 8-16, eight horse power on drawbar and sixteen horse power on the belt, and I regard this as a good all-purpose machine for a farmer of this section. In plowing for my neighbor, ten acres, I averaged over ten acres a day and burned forty-five gallons of kerosene, at 9½ cents a gallon, and about six gallons of gasoline at 24 cents a gallon, for the entire job. I also used about five gallons of lubricating oil, at 34 cents a gallon. My total expense for the job was about $10. I received $6 per acre for my work and so you see cleared about $50. I am starting on a twenty-acre piece for myself and will sow rye this fall. I will try and break forty to fifty acres for rye. I intend also to run ensilage cutter this fall and may be able a little later to give you more facts about the tractor. A year from now I will know more about the machine and its value than now.

CURRENT EVENTS

NO attempt is made at Washington to minimize the seriousness of the war situation in Europe. The United States is in the war and will go through with it, but any hope of a short struggle has gone glimmering with the apparent complete collapse of the Russian war machine. The development was not unexpected by many army officers. When the offensive of July 1st was started by the Russian forces, the most frequent comment heard in Washington was that it was probably the dying kick of the old Russian machine. For the United States the Russian collapse may have an immediate and direct bearing. It will, if the German general staff presses its advantage, release additional German forces to bolster up the western front where American troops are to be engaged. The German line on the west has not been seriously impaired at any point, officials here believe. It has been noted, in fact, that the one strategic advantage gained in recent fighting was gained by the Germans. Many officers here believe that when a small sector of the British line in Belgium was overwhelmed, the Germans improved their weakest front materially. That being the situation, the importance of assembling and training a huge American army becomes all the more important. Men whose names were drawn early for the conscript army are already being examined by their local selection boards, while the state exemption boards are holding meeting and perfecting organizations. The sixteen cantonments, where the million soldiers will be drilled, are being rushed to completion and the new army should be in uniform by the first of October, at the latest. A second army will be assembled a few months later, so that by next spring the United States will have close to 2,000,000 men under arms.

APPROXIMATELY two-thirds of the national guard of the country is now in the federal service under President Wilson's call. The remaining units will be brought in August 5th, on which day the whole force of probably 300,000 men will be drafted into the army of the United States and will lose its status as militia. From that day on the state troops can be used for any duty the president may direct and will be subject to no limitations that do not apply to the regular army. The first increment of the guard was called out ten days ago. Those called now in the second increment embrace New England, middle western and northwestern states and several southern states. Probably more than 150,000 men went on the federal pay roll. New York, Pennsylvania and Ohio troops and those from several other states were in the first increment. With federalization of the entire force complete after August 5th, the ranks of all regiments then will be filled up to full war strength with men from the selective draft lists. If transportation is available, the best of the state troops may be hurried to France at once, stopping only for final outfitting before they sail. The intensive instruction to fit them for trench warfare will be given at the American training camps in France, where General Pershing's regulars already are at work.

THE Russian offensive in Galicia has crumbled, whole Russian regiments retiring before the Germans and Austrians without making any attempt whatever to hold the ground they had gained, at a heavy cost, but a few days before. In the crisis, the man of the hour, Kerensky, has been appointed a virtual dictator. He is doing everything humanly possible to restore order and discipline, but the task is almost too great even for a man of his force and leadership. It is now recommended that all deserters and soldiers who retire, except under the strongest pressure from the enemy, be summarily shot as cowards. Whether the iron hand will be forthcoming to make Russia a gain a factor for the allies is very doubtful, however. It is reported unofficially that much of Russia's determination of the past few weeks is due to the work of Elihu Root, at the head of the American commission, who has handled things with force and vigor. But Russian affairs are sadly demoralized and but little can be expected of that nation for some time to come, if ever during the war.

PLANS worked out in congress for raising war revenue were overturned by announcement of forthcoming additional estimates for war expenditures aggregating more than $5,000,000,000, principally in anticipation of assembling a second army of 500,000 men under the selective draft. Secretary McAdoo, at a special meeting of the senate finance committee, revealed that the war department alone is preparing estimates to cover additional expenditures of nearly $5,000,000,000, and asked the committee to hold up the $1,670,000,000 war tax bill until the detailed estimates of all departments are submitted. The committee agreed to the request and pigeonholed a report on the measure which it had planned to submit. The new estimates, including $500,000,000 additional for the shipping board and $100,000,000 for the navy department, are to be submitted to the committee soon. Then there will be another revision of the war revenue measure, probably resulting in an increase of the bill's gross tax levy by from $35,000,000 to $1,500,000,000. Further credits may also be authorized in the form of bonds or indebtedness certificates. Besides the additional sums needed for the American war program, Secretary McAdoo told the senate committee that the $3,000,000,000 authorized for loan to the allies for their further assistance would be needed.

WHILE the United States is preparing to spend an additional five billion dollars for war preparation, as outlined by Secretary McAdoo last week, Great Britain goes ahead spending about $35,000,000 a day, with the largest war budget now asked for or ever known in history. Moving in the house of commons a vote for $3,500,000,000, the largest war credit yet asked and bringing Great Britain's expenditure to the colossal total of $36,460,000,000, Andrew Bonar Law, chancellor of the exchequer, gave startling figures of the amazing growth of great Britain's financial burden in the world war and emphasized from the financial viewpoint alone the great importance of the United States entering the war as insuring that the allies would not be deprived of victory through lack of money. The house was astonished to learn that Great Britain's advances to the allies and dominions had already reached the huge total of more than $5,000,000,000. The daily war expenditure although it shows a substantial improvement over the figures given on May 9th, when Mr. Bonar Law asked for the last war credit, still approaches $35,000,000 daily and exceeds the budget estimate by $5,000,000 daily, but comparing the last seventy-seven days with the first thirty-five days of the financial year, the expediture showed a reduction of a million daily.

THE administration food control bill, rewritten after five weeks' bitter contest, was passed by the United States senate last week by a vote of eighty-one to six. The senate made so many changes in the bill as passed by the house that the bill is now in a hopeless tangle. The house appointed a committee to confer with the senate, but has instructed this committee to reject all the senate changes. As revamped by the upper house the bill gives the president broad authority over foods, feeds and fuels, the latter including kerosene and gasoline; provides for administration by a food board of three members, instead of an individual; authorizes federal fixing of coal prices, requisition and operation of mines and authorizes a minimum guaranteed price of not less than $2 a bushel for wheat at primary markets. The senate prohibition section, prohibiting manufacture of distilled beverages during the war and directing the president to buy all distilled spirits in bond, was substituted for the house "bone dry" provision and will be one subject of difficulty in conference. The food administration change is aimed directly at Herbert C. Hoover, the American who had charge of the relief work in Belgium, who has been appointed food commissioner here in the United States and to whom objection has arisen, led by Senator Reed, of Missouri. The president is said to stand firm on the proposition that Mr. Hoover is to have complete charge and that he will not accept a board to have any supervision over Mr. Hoover. The matter is badly tangled now and it will probably take several weeks to clean it up.

Speedway's Crushing Tests Prove Hudson Super-Six Endurance

Four Hudson Super-Six Specials raced at Cincinnati. All four finished in the prize money: First, in the Free-for-All; Second, Seventh and Ninth in the 250-mile classic.

At Chicago on June 16, Ralph Mulford in a Hudson Super-Six Special broke the American speedway records for 150 and 200 miles. For 200 miles he averaged 104 miles an hour—faster than any car ever traveled such a distance before.

Speedway racing is the most abusive of all motor tests. Every part of a car is subjected to manifold destructive stresses. It is endurance that counts most on the Speedway.

Hudson Super-Six speed tests are in reality endurance tests. It is possible to build faster cars than the Hudson Super-Six Special, but the speedway record of 104 miles an hour for 200 miles, now held by a Hudson Super-Six Special, proves that endurance is more important.

Our interest in racing is not so much to see how fast we can make the Hudson Super-Six. It is to demonstrate motor endurance. It would take too long, at ordinary driving speed, to demonstrate the endurance life of a Super-Six. The speedway in a few hours calls for all the stamina required in years of ordinary use.

No other racing car of prominence so nearly resembles stock production as does the Hudson Super-Six. Practically all of the notable racing cars, and particularly those against which the Hudson Super-Six Special has shown its superiority, were built especially for racing. They bear slight resemblance to the stock production of any factory. Their cost is usually so great that not more than two or three cars are ever built. The Hudson Super-Six is essentially a production car.

The very qualities of endurance that are necessary in racing are the qualities you should demand in the car you buy. It guarantees safety, low maintenance cost and long service.

You can get a Hudson Super-Six in any body type you may desire. There are eight designs to choose from. The carriage detail matches the high quality of the chassis construction.

Experiment Work in Wood County

Valuable Lessons on Better Use of Land Are Made Known at Big Gathering on Farm Near Marshfield.

WOOD county was invited to come and view at first hand the work of the county experiment station at Marshfield, Friday, July 20th. And some 300 or more came, and saw, and went home satisfied that the experiment station is a good thing and Mr. F. L. Musbach, in charge, is doing his work well.

The day was announced as picnic day, but it was more like going to school. Every hour was taken up by lectures and field trips.

Dean Russell, of the college of agriculture, opened the day's program by giving the visitors some facts on the question of food conservation and what it really signifies. His talk was based on sound arguments and free from all kinds of impossible suggestions which have lately been the chief stock-in-trade of many of our well-meaning, but uninformed, citizens and public men. The dean first pointed out the necessity of branch experiment stations, like that maintained at Marshfield. Types of soil and local conditions are important factors in determining the best types of farming to be practiced. What is good in Ashland or Spooner is not always good for Wood county and vice versa.

Better use of the land and more returns in crops and dollars from that land must be the solution of America's problem of feeding the world according to Dean Russell. The wheat output of all nations is short this year. Russia has wheat, but no way of getting it out of the country. Australia has a normal crop, but lacks transportation. Argentina has only half a crop; Canada, if reports of the last few weeks are true, has suffered severe failures in several of her wheat sections. In our own country Dean Russell stated 5,000,000 acres in Oklahoma and western Nebraska had to be put into forage crops because the wheat winterkilled.

Wisconsin is not primarily a winter grain state. She is a dairy state and the greatest in America. But Wisconsin can raise wheat. There are hundreds of farmers doing so at a profit and they are dairying besides. But wheat or rye or any other crop should be raised only from the best seed obtainable, given the maximum amount of care in regard to preparation of seed bed and tillage and should be kept free from diseases such as smuts, blights or rusts. Animal diseases, likewise, should be held in check by the use of the methods that science has evolved for that purpose.

The mistakes of Germany were cited by the dean in proof of his arguments for live stock conservation at this time. Germany in 1914-15 butchered half of the hogs in that year, 16,000,000 of them, in the belief that the war would be of short duration. She has realized her mistake now and is trying to rebuild her swine industry. We are making the same mistake, according to Dean Russell. Reports are that the New England states are selling off their dairy cattle in unheard numbers. High prices for feed—too high in the estimation of the New England dairyman—coupled with high prices of meat on the hoof, are tempting these men. This condition can be remedied by a minimum price being set for our farm products by the government. Though the patriotic side of the farmer has been successfully appealed to since the war began, it is not fair in the estimation of Dean Russell to ask farmers to continue to produce extra large amounts of foodstuffs and give them no assurance in regard to prices. The dean is not alone in his contention. He is championing a contention thousands of farmers have made since the increased production campaign was begun.

Education should also not be neglected. England did so. England is sorry. "If the war is short, why," asked the dean, "tear down what required years of hard, earnest efforts to build? If the war, on the other hand, will continue for a number of years, we must be ready to replace the men who with their education unused dies in the fight for our country. We must keep our educational institutions going. Only by feeding in from below new minds and new men can we keep pace with the destruction of lives that this war will entail."

Following the dean's address E. J. Delwiche, in charge of the northern branch experiment stations which includes Wood county, took charge of the men and showed them the field work. The women meanwhile heard Prof. J. G. Halpin, of the college of agriculture, talk on the parasitic diseases that play havoc with the poultry crop each year. Mites, lice and chicken ills of all kinds were discussed in detail and for each of the troubles a proper remedy advised.

Some excellent work of the Wood county station is that done in regard to winter wheat. Clover, peas, wheat is the rotation followed. Wheat can ask for no better seed bed than that prepared following peas. Wheat growing in Wisconsin, according to Mr. Delwiche, is a lost art. Quite generally wheat is sown too late in the season to make a successful growth. "Seeding wheat on September 6th or later is tempting nature," said Mr. Delwiche. If there is not enough time to prepare ground at least two weeks before seeding, then let the field be sown to rye. No wheat for Marshfield and vicinity ought to go into the ground after September 1st-4th. Rye can be put into the ground as late as October 1st and it will do well.

Early seeding gives the grain a better chance to stool. Six pecks of wheat to the acre is sufficient. Top dressing with manure is good. Manuring winter grains is not advisable except as top dressing. The Turkey Red and the Bacsca have proved superior for Wisconsin conditions.

Blight-resistant peas, rust-resistant grains and oats that will not lodge are some of the improved seed strains that the station intends to produce. They are making headway, too. The peas looked the best of any seen this year and were judged excellent by everyone there.

Various rotations and treatments of soil with rock phosphate and acid phosphate lime and manure form another set of experiments. Liming has been found necessary for successful growing of clover and alfalfa and beneficial to oats in strengthening the stalk and is accepted as good for corn. The four-year rotation has so far shown up well. This consists of two years of hay, ten pounds of clover and five pounds of timothy, one year oats and one year corn.

In the afternoon there was another field trip under the direction of Mr. Musbach and for the women a demonstration by Miss Gladys Branegan, of the college agriculture extension department on drying fruits and vegetables. Shortage of tin and glassware and an unusual supply of vegetables makes the old-fashioned method of drying our fruits and vegetables of importance. Sun and oven drying are the most usual forms. Oven temperature must not be too high in order not to cook the food. For each vegetable and fruit variety different methods must be followed to insure success.

Mr. Halpin then gave a talk on "How to Tell a Laying Hen," and he pointed out the factors that makes up a laying hen on living models. The red color of the comb and the disappearance of the yellow color from the legs are the surest indication that a hen is a worker. Early out of bed and late to roost, heavy feeding, frequent singing, short head and late molting are other indications of the good useful fowls.

Mr. T. L. Bewick, of the college of agriculture, in charge of the boys' and girls' club work entertained a host of youngsters during a good part of the afternoon. Weed identification and games kept the children interested in spite of other attractions.

Fond du Lac Sales Pavilion.

A cattle sales pavilion is being erected at Fond du Lac. This building will be completed in time for a May 1, 1918, sale. The structure will cost about $20,000.

The sales pavilion is the result of an agreement between the rural development bureau, representing the Association of Commerce, and F. J. Bristol, of Oakfield, and S. H. Bird, of South Byron, representing the Holstein breeders of Fond du Lac county and of the Fox river valley.

This pavilion will serve for breeders of several counties, including Fond du Lac, Winnebago, Brown, Sheboygan, Calumet, Ozaukee, Washington, Dodge, Green Lake, Outagamie, Waushara and Manitowoc.

The building will be about 120 feet square, of frame and concrete construction and two stories in height. It will be absolutely modern in every detail and will contain a large sales ring which will accommodate 200 head of stock. The first sale is planned for May 1, 1918, and this will be followed by many other important sales.

Barron County Picnic.

Members of the Rice Lake-Cedar Lake Cow-Testing Association met at the Ed Yager farm in Barron county Saturday, June 30th, for their annual picnic. There were about 150 present. Mr. E. H. Thompson gave a brief address and introduced the chief speaker, Prof. Geo. C. Humphrey, of Madison. He talked on dairying with special reference to tuberculosis and the fortunate position which Upper Wisconsin occupies in regard to this dread disease among cattle.

Prof. F. M. White, of the agricultural engineering department at Madison, talked on sanitary conditions of the farm home, urging modern conveniences, pure water, and doing away with the cesspool. Professor White advises farmers to vaccinate for typhoid fever and he succeeded in interesting a number of farmers in more conveniences for the farm home.

County Agricultural Agent Mr. Cuff urged the application of the new tuberculosis law in Barron county. While Barron county has practically no tubercular cattle, the county agent and the progressive dairymen are interested in adopting such measures as will keep the county free from this disease.

Farmers and their wives participated in a judging contest and it was a great day for dairying in Barron county.

FARMERS' MARKET

WANTED — FOR SALE — TO EXCHANGE

THIS department is to bring the buyer and the seller together. You may have live stock, poultry and eggs or machinery for sale. You may want to sell or buy a farm. Write your copy for the advertisement. The rate is six cents per word, each insertion.

THE WISCONSIN FARMER - MADISON, WIS.

FARM LANDS.

SILENT PARTNER WANTED—We have a fine chance to buy fine farms close to the city of Oconto, Wis., suitable for stock farms, that would feed over a thousand head of cattle, at a very low price on account of old age and death of owners. There are over 100 head of thoroughbreds on them now that would go with the farm. There is big money for the party that would furnish the money to swing the deal. Address C. S. Hart, Oconto, Wisconsin.

RUSK COUNTY LANDS! In the great dairying district of Northern Wisconsin, offer great opportunities for industrious farmers. We want people, looking for homes, in this ideal, partly timbered district, to write us so that we can tell them why it is to their interest to buy their lands of us. Send name and address today. Flambeau River Lumber Co., Owners, Station D, Ladysmith, Wisconsin.

CHOICE SNAPS—160 acres level lying, easily cleared land; clay loam soil; considerable building timber and firewood; good stream of water; splendid stock proposition; on good road; school, church and cheese factory 2 miles; $15 per acre. An 80 at $10 per acre; a 40 at $300. One-fourth down. Can be had without down payments. Write for particulars. The Ev. Luth. Colonization Co., No. B-M, Dept. 10, Merrill, Wis.

HARDWOOD cut-over land, silt loam, clay subsoil. Not sandy or gravelly. Close to towns. Good roads. In the heart of the dairy country. You deal direct with the owners. No agents and no commissions. Easy terms. Write for map and booklet 9. North Western Lumber Company, Land Department, Stanley, Wis.

SQUARE QUARTER, Red River Valley land, all under cultivation, buildings little value, three miles from two good railroad market towns. Best quality soil, well drained, no waste land; excellent neighborhood. $45 per acre for quick sale, easy terms, 6 per cent, no trades. C. L. Lindstrom, Grand Forks, N. D.

FOR SALE—200 A. farm; 50 A. in crops; 60 A. in pasture. Rest good wood land. With buildings. Will sell cheap. Inquire Claude Detjens, Gleason, Wis.

WOULD YOU SELL YOUR FARM if you got your price? Sell direct. No commissions. Particulars free. Charles Renich, G-2, Woodstock, Illinois.

LIGHTNING RODS that are guaranteed protection, $250.00 to find a building burned by lightning with our rods. L. F. Diddie Co., Marshfield, Wis.

FOR SALE—80 acres best timber land, Clark county. Inquire John Nicholson, Coal City, Ill.

LEARN TELEGRAPHY.

TELEGRAPH OPERATORS IN DEMAND—One superintendent writes: "Can use 25 operators tomorrow." Ladies or gentlemen. Wisconsin School of Telegraphy, Oshkosh, Wis.

LEARN TELEGRAPHY—Positions guaranteed; Young men and women. Write Northwestern Telegraph School, Eau Claire, Wisconsin.

MONEY TO LOAN.

MONEY TO LOAN on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage. 6% with privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

CALVES FOR SALE.

CHOICE HIGH-GRADE Holsteins, Guernseys and Short-horn calves. A few select ones at $15 to $35 each, expressed at little cost. Write Ed Howey Co., South St. Paul, Minn.

MILKING MACHINE FOR SALE.

FOR SALE—Milking machine. Two-cow unit. Automatic vacuum and natural air pressure type. In first-class condition. Address G. G. Daugherty, 83 S. Stone Ave., LaGrange, Ill.

ALFALFA SEED.

ALFALFA SEED—$8.00 per bushel. Good purity and germination but dark color. Better grades for more money. Write for samples and prices. Henry Field, Shenandoah, Iowa.

HOLSTEIN COW.

REGISTERED HOLSTEIN COW, defective udder, richest breeding, bred to a 44-lb. butter sire, $150. R. M. Harriman, Appleton, Wis.

BELGIAN HARES.

EARN $20 WEEKLY raising Belgian hares. Particulars, 10c. Ulysses Anderson, 2421 Ogden, Denver, Colorado.

Continued Interest in Baby Beef.

Wisconsin Boys Who Have Entered Contest Write Interesting Letters to Assistant Secretary Baker.

THE baby beef contest for 1917 is a success according to Secretary Baker, of the Live Stock Breeders' Association. Fifteen county fairs have put in classes for baby beef this year and a lot more have promised to do so, but have not been heard from as yet.

There are more entries this year than last and the letters which the boys are sending in to Mr. Baker are good evidence that every one of the young stockmen is on his toes to produce a prize winner.

This is the second baby beef contest held in Wisconsin. The rules this year permit any girl or boy between the ages of ten and twenty years to compete. The girls are yet to be heard from, however.

John C. Robinson, expert stockman himself, is the field man or baby beef specialist. He is visiting the boys who have entered the contest and supplementing his series of letters on baby beef production with heart-to-heart talks. In his letters Mr. Robinson has made clear to each contestant why baby beef raising is important, what to look for in a baby beef, the market side of baby beef production and how to feed prize-winning baby beeves. By his visits Mr. Robinson analyzes each separate case for the boy, points out the good and the bad practices of feeding and instructs him in the proper manner of caring and finishing out an animal.

Here are just a few of the letters the boys are writing to Mr. Baker, of the Live Stock Breeders' Association, telling of their experience with baby beef growing:

Baraboo, Wis. Dear Sir:—The 10th of March my calf weighed 330 pounds. The 24th of June he weighed 598 pounds. George Premo's calf weighed 360 pounds on the 10th of March and 606 pounds on the 24th of June. We are well pleased with the way they are doing. We are feeding ground oats, corn, bran and oil meal and are going to add molasses later on. Stanley H. Premo, George Premo.

New Richmond, Wis. Dear Sir:—My calf is getting ten pounds of skim milk three times a day, three and one-half pounds of oats and cracked corn three times a day and five pounds of alfalfa hay three times a day. He was six months old on the 4th of July. He now weighs 436 pounds with a gain of eighty-four pounds in less than a month. Last month he gained ninety pounds. Daniel Hasebach.

Gotham, Wis. Dear Sir:—When I got my calves this year the oldest weighed 415 pounds, the smallest 190 pounds. I began feeding oats and corn mixed while the calves were sucking a cow. I kept increasing the amount of feed as the calves' appetites increased. On June 1st I began feeding three times a day. On June 6th the oldest weighed 620 pounds and the youngest 415. Wayne Martin.

Dane, Wis. Dear Sir:—My calf is a grade Short-horn steer dropped November 3, 1916. He is not the best kind of a calf, but he is the best obtainable. As he was fed on skim milk before I took charge of him he did not make big gains like those sucking a cow. He weighed 511 pounds of the 30th of May. I am feeding ground corn, oats, barley and linseed meal in a mixture, three times a day with a little molasses. Alfalfa hay is before the steer all the time and receives water regularly three times a day. Henry Kurtz.

Bagley, Wis. Dear Sir:—My calf is growing like a weed. He will weigh about 700 pounds and he is only nine months old. He was always small for his age until a few months ago, but since then he has picked up fast. He has a good appetite and eats regularly everything I feed him. Ted Scott.

Gilmantown, Wis. Dear Sir:—My calf got along fine until the first of June when it slipped on the cement walk and hurt its back. For three weeks is could not get up, but now it is again as spry as ever. It is averaging a gain of three pounds a day. I am feeding it all the skim milk it can drink twice a day and a mixture of one-third each of oats, corn and bran and a handful of oil meal three times a day. I am now feeding him clover hay. This picture was taken when the calf was two months old. Walter C. Farmer.

All the letters carry a special invitation for Mr. Robinson, the field man, to come and see the calves and each boy is confident the advice of Mr. Robinson will do much to bring the calf feeding to a successful finish.

The final round-up for the contestants will come on November 21st and 22d when the first three prize winners at each county or district fair contest will exhibit their prizes at Madison. Last year's winner was Alvin Morley, of Baraboo. His steer was later on exhibited at the Chicago International, where it won first and reserve championship. Herr Bros. & Reynolds, of Lodi, exhibited him at Chicago.

TYPES OF BADGER BABY BEEF RAISED BY ALVIN MORLEY, SAUK COUNTY PRIZE WINNER IN 1916 CONTEST.

Farm According to Plan.

To the Editor:—Efficiency in handling the farm work this year is one of the primary considerations that every farmer should have in mind. Farm labor, at best, is not going to be any too plentiful. For this reason, as a matter of patriotism as well as one of dollars and cents, every minute of available time should be utilized to its best advantage.

The only way that this can be done is to plan ahead, to know what your work is going to be tomorrow, next week or next month. The success of large business houses is largely due to this "planning ahead" and with many firms it has been the direct means of saving them in struggling against the many problems of competition, selling and buying.

The farmer should be just as much of a business man as the banker, manufacturer or the storekeeper. Note the farmers in your neighborhood who have been the most successful. You will find that these men have planned ahead, not only in the solving of their labor problems, but in the selling of their produce, and in the purchasing of stocks, feeds and other supplies. Farmers of this sort are excellent men to follow, for what they have done others can do provided they will exert the same effort coupled with good common sense.

It is the labor problem this year which must be utilized to its fullest efficiency and this represents a problem to the farmer which will require his best business judgment. This is no time for the farm slacker or procrastinator. Work must be planned ahead and it must be done at the time planned on if the farm is to produce its maximum.

A big aid in helping the farmer to plan his work is a pocket notebook or "farm reminder." Make up your mind when the best time will be for doing the hundred and one jobs you have to do and make a note of them so that they will be done when originally planned and not a week or two late. Whenever you discover a piece of broken machinery which you are going to need later on, use your "farm reminder" so that there will be no excuse for you losing a day or two of good working weather simply on account of your forgetting about it. Everyone makes mistakes and this year of all years it is our duty to fight against them and make just as few as we possibly can.

A job which can be done during a rainy day should never be done during clear, working weather when the time can be more efficiently employed in the field. Whenever a "rainy day" job is discovered, and it is always a good plan to go out of your way to discover them, make a note of it and then utilize your working force to its best advantage when your first rainy day comes along. A great deal of time will be saved in doing this.

"A stitch in time saves nine" is a mighty good axiom. If you can do a job today which will only take a short time, but which is liable to take several days later on, do it and then credit the time saved to your labor account.

Never put off until tomorrow a job which you can do today, but whatever is done let us do that job today which will mean greater crops later.

Utilize the energy of the children by giving them certain responsibilities. It will be the best preparation in the world for the greater burdens which they will have to take up later.

There are a great many small jobs, but ones that take time, which can be done just as efficiently by them as by the regular farm hands. Make a note of these small jobs so that they will be taken care of at the proper time. Nothing will please the average farm boy so much as that of having a few calves or hogs placed under his charge, and with a little instruction beforehand in regard to feeding and management the ultimate result will be just as good or perhaps a little better than it would have been otherwise.

Make a thorough analysis of your farm. Study it from every point of view and take time to do a good job of it. Try and determine where you can make the short cuts and when and at what time your activities can be best utilized. If you have more help than you really need, arrange your work so that you can aid the neighbor who is not so fortunate. If you are short of help, do your part in making every effort to procure it. Your county council of defense has been organized to assist you in handling just such problems and they will help you with them if you will but let them know of your needs. F. D. Lewis.

College of Agriculture.

Forty tons of shelled peas from twenty acres is the yield of one Douglas county farm northeast of Lawrence, Kansas. This was the first crop. Now the same twenty acres is doing double duty by growing corn, planted since the peas were cut three weeks ago. The peas were raised by W. A. Pine and four sons. The crop, when cut and hauled to the canning factory, sold for 2 cents a pound, bringing $1,600. The output of the canning factory on this yield is estimated at 80,000 cans.

"Perfect Control"
With One Lever

MOVE this lever forward to go ahead—back to reverse—neutral to stop. Could any control be more simple? This is one of the many advantages in the Heider special friction transmission. "I didn't know any more than a six year old boy about an engine when I bought my Heider," says one owner. "Yet I plowed and double disced 200 acres, cut 70 acres wheat, sowed 110 acres, and had no trouble that I could not locate myself." The

"Friction Drive Beats 'Em All" "I believe what makes this engine the high grade that it is, is the friction drive, thereby getting seven speeds without disconnecting the power or running chances of stripping any gears." F. H. HILBORN Mohall, N. D.

Heider

12-20—Made and Sold by Rock Island Plow Co.—9-16

is the unusual tractor. And it gets unusual results. Its friction transmission is one of the biggest successes ever put in a farm tractor. You cannot strip the gears—nor lose power turning needless parts. You get your engine's best all the time, without strain, and without wasting fuel. No sudden jerks in starting the load behind the drawbar or the machinery on the belt. The Heider is the thorobred among tractors. Backed by its own experience of 9 successful years, and 62 years of building Rock Island Farm Implements with their unbeatable reputation in all parts of the world. Write for catalog and booklet of letters from owners.

ROCK ISLAND PLOW CO., 412 Second Ave., Rock Island, Ill.

Also manufacturers of the famous line of Rock Island Farm Implements, including Discs, Plows, Planters, Seeders, Cultivators, Listers, Hay Rakes, Hay Loaders, Manure Spreaders, Cream Separators, Litter Carriers, Gasoline Engines, Stalk Cutters, etc. Write for catalog.

All Heider Tractors Burn Kerosene, Gasoline or Distillate Fuel

HEIDER MODEL D 9-16—Sold with or without two Rock Island No. 9 Plows attached. Foot control of plows—automatic power lift. Handy in fence corners—a time and work saver anywhere in field.

HEIDER MODEL C 12-20—Gears enclosed in dust tight case, working in oil. Heider Tractors have standard four wheel construction—four cylinder heavy duty Waukesha motors. 7 speeds forward—7 reverse.

Letters intended for publication should be accompanied by the name and address of the writer, not necessarily for publication, but as a matter of good faith. All communications intended for this department should be addressed to Editor Home Dept., Wisconsin Farmer, Madison, Wis.

Jelly Making.

Many letters have been received by the Home Department asking for information relative to the making of jelly. The writers of some of these letters complain that their jelly is sirupy, others that it is tough and leathery, while still others say their fruit juice will not jell at all.

These conditions are accounted for by the nature of the fruit and the proportion of sugar that is used in making the jelly, as well as by the method of handling. A soft, sirupy jelly, for instance, is the result of using more sugar than the fruit juice requires, or because boiling after the sugar has been added has not been continued long enough to drive off excessive water. Too much sugar, also, will cause the appearance of crystals throughout the jelly. A tough jelly, on the other hand, results from the use of too small an amount of sugar or because the boiling is prolonged after the jellying point has been reached. A cloudy jelly is due to having cooked the fruit too long before straining off the juice or to not having used sufficient care in straining the juice. In the case of apple and crabapple jelly it quite frequently occurs that when first made the jelly will be clear, later becoming cloudy. Usually this condition is due to the use of partly green fruit, the starch in the fruit causing the cloudy appearance.

As to the failure to jell, the juice from certain fruits, such as grape, apple, crabapple, orange and current is better suited for making jelly than that from certain other fruits. This is because the juice from these fruits contain in greater proportion than others the properties necessary for jelly making, pectin and acid. Some fruits lack pectin, the fundamental jelly-making substance, in such proportion that their juice will not jell unless pectin is supplied from some other source. This is usually accomplished through the addition of the juice of other fruit rich in pectin. The peach, strawberry and cherry are examples of fruits which contain acid, but are lacking in pectin. Other fruits, such as the pear and quince, contain a sufficient amount of pectin, but are lacking in acid. In this case the proper balance can be obtained by adding juices from acid fruits. The amount of pectin which any given fruit juice contains may be determined by a simple test which is described below.

From Farmers' Bulletin 853 we quote the following explicit directions for jelly making, a careful study of which should enable anyone to make a good jelly from the fruit at hand:

Wash such fruit as berries, grapes, and currants in running water and add one cup of water for each pound of fruit. For apples, quinces and such hard fruits, wash, slice and add three cups of water to each pound of fruit. The fruit should be cooked until tender, a small quantity of water being added to help extract the juice. The fruit juice will flow more freely when heated than when cold, and the cooking develops the pectin. As soon as the fruit is tender the liquid should be squeezed through a cheesecloth and then be allowed to drip, without pressure, through a flannel jelly bag. Overcooking of the fruit is apt to result in a cloudy jelly. After cooling the juice to room temperature test it to determine the amount of pectin present. This test gives some idea of the proper proportion of sugar to juice. Add one tablespoonful 95 per cent grain alcohol to an equal volume of cooled fruit juice and shake gently. The effect of the alcohol is to bring together the pectin in a jelly-like mass. If a large quantity of pectin is present it will appear in one mass or clot when poured from the glass. This indicates that equal quantities of sugar and juice may be used. If the pectin does not slip from the glass in one mass, less sugar will be required. A fair proportion is three-fourths cup of sugar to one cup of juice. If the pectin is thin and much separated, one half cup of sugar allowed for each cup of juice will be sufficient.

The quantity of juice to be cooked at one time will depend upon the size of the vessel and the methods of heating available. The capacity of the vessel used should be four times as great as the volume of juice to be cooked. If the attempt is made to cook a large quantity of juice at one time over a slow flame, there will be a loss of color and a decrease in the yield, partly due to the destruction of the pectin.

When the proportion of sugar to juice has been determined, measure the fruit juice and place over the fire to cook. When the juice begins to boil, add the sugar immediately and stir until the sugar is dissolved. By adding the sugar when the juice begins to boil, more time is given for the inversion of the sugar by the acids of the fruit and there is less danger of crystallization.

After the sugar has dissolved, the cooking should be as rapid as possible. Finished jelly can be obtained more quickly by rapid cooking. Long cooking will tend to darken the product and destroy the pectin, which will cause the finished jelly to be less firm.

A thermometer can be used to great advantage to show when the jellying point is almost reached. No exact temperature can be given, because the jellying point differs with different fruits, with the quantity of sugar used, and with the same fruits at different seasons.

Since no definite temperature can be given for the finished jelly, the most convenient means of determining when it is finished is to test it with a spoon or paddle. Dip a spoon or wooden paddle in the boiling mass. Remove and cool by moving it back and forth for a few seconds and then allow the jelly to drop from it. As long as there is sirup present it will run or drop from the spoon. When the jellying point is reached, it will break from the spoon in flakes or sheets. When this jelly stage is reached, remove from the fire immediately and skim. Skimming at this point saves waste. After skimming, pour at once into hot, sterilized glasses and set aside to cool.

Care should be exercised when boiling the sirup not to allow it to spatter on the side of the pan and dry, because in pouring the finished product into the jelly glasses these crystals will be carried in also and the jelly become seeded with crystals. It is a good idea to keep the side of the pan wiped down with a clean, damp cloth so that the crystals cannot form.

Jelly should be cooled as rapidly as possible and when cold covered with melted paraffin. Store in a cool, dark, dry place.

Meals for the Harvesters.

The harvesting season is here and in some localities the usual rivalry between farmers' wives to see who can prepare the most elaborate meal for the hands will hold sway. But not in all communities, for some of us are learning that the simpler meals are best and that in order to the better serve others we must save ourselves.

Some of us are going to plan our meals so that a great deal of the work of preparation can be done in the cool of the morning and the cooking done in the fireless cooker. We are going to furnish only nourishing food, temptingly prepared and served, and omit the fancy dishes. We are going to plan our meals solely with the idea of supplying nourishment, with no thought as to how many different kinds of pie or cake Mrs. Jones or Mrs. Smith served. Maybe it will be a temptation to some to outdo Mrs. So-and-So, but the reward will be in the fact that the men will like it better and will go back to their tasks better fitted to perform them. If we give them what they need to sustain their strength and energy our task will be well done.

"What to have" is always a question, whether the meal be simple or otherwise. The home economics department of the Kansas Agricultural College has prepared a number of menus to help the farm wife with her harvest-time meals. These are only sample menus and can be changed to suit the locality or season. But they serve a good purpose in suggesting ideas and we give some of them for the benefit of the busy housewife:

Breakfast—Fruits and cereals, bacon and eggs, creamed potatoes, milk and coffee.

Dinner—Pot roast of beef with gravy, browned potatoes, creamed corn, sliced tomatoes, corn bread, jelly, fresh apple pie, iced tea and milk.

Supper—Cold sliced beef, browned potatoes heated in gravy, stewed tomatoes, southern slaw, bread, preserves, canned or fresh fruit, tea and milk.

Where bacon and hot biscuits occur on the same menu the bacon can be cooked in the oven while the biscuits are baking by placing it on a wire rack in a dripping pan.

For pot roast a cheap cut of meat can be used, such as a piece of rump or shoulder. Sear the meat well on all sides in an oiled iron kettle, add a small amount of water and let simmer until tender. About an hour before it is done add the pared potatoes, turning them frequently so they will brown evenly. Extra allowance of potatoes and gravy should be made for the evening meal.

Breakfast—Fruit, broiled ham, eggs, fried mush, bread, syrup, coffee and milk.

Dinner—Fried chicken with gravy, mashed potatoes, green beans, lettuce salad, bread, cherry roll, iced tea and milk.

Supper—Cold fried chicken, creamed potatoes, sliced tomatoes, bread, preserves, chocolate bread pudding with whipped cream, tea and milk.

Where the dinner menu calls for mashed potatoes boil extra ones, to be used as creamed potatoes for the evening meal. After dinner combine the remaining mashed potatoes with egg and shape into patties ready for frying the following morning. The chocolate bread pudding should be made during the morning hour. When preparing supper keep in mind things that may be cooked on the same fire for breakfast.

Breakfast—Fruit, cereal, creamed dried beef, poached eggs, potato cakes, hot biscuits, jelly, coffee and milk.

Dinner—Soup, pork, apple sauce, rice, boiled beans, boiled cabbage, fresh onions, corn bread and white bread, caramel custard ice cream, milk and coffee.

Supper—Cold sliced pork, German fried potatoes, baked beans, cottage cheese, corn bread and light bread, baked apples with whipped cream, tea and milk.

Caramel custard ice cream is made by combining three cups of milk, two eggs, one and one-half cups of sugar (half caramelized) and making a steamed custard. When this is cooled add three cups of cream and freeze. Baked apples should be prepared in the morning. Extra rice should be cooked and all that is left put into a can and molded to be sliced for breakfast.

Breakfast—Fruit, cereals, bacon and eggs, fried rice muffins and sirup, coffee and milk.

Dinner—Soup, baked ham with gravy, boiled potatoes, creamed peas, fried apples, radishes.

Supper—Cold sliced ham with mustard, potato salad, buttered beets; pickles, bread, preserves, baked custard, tea and milk.

In preparing one meal watch for opportunities to make use of the same fire and the same time and labor in preparing dishes for the coming meal. Biscuits for breakfast can be made and molded in the evening and put in the refrigerator.

Breakfast—Fruit, cereal, minced ham and eggs scrambled, creamed potatoes, hot biscuits, jelly, coffee and milk.

Dinner—Soup, New England boiled dinner, horseradish, corn bread, jelly, tapioca pudding, coffee and milk.

Supper—Corned beef hash, greens, sliced tomatoes, corn bread, light bread, fruit, cake, tea or milk.

For the New England boiled dinner, which should be started early in the morning, wipe carefully a piece of well corned beef, plunge into boiling water and let simmer four or five hours until the meat is tender. A piece of salt pork from which the rind has been removed may be added and the two cooked together. About one and one-half hours before time for serving prepare turnips, carrots and beets. Add the turnips and carrots to the stock. Cook the beets separately, using some of the meat stock to cover them. Prepare onions and cabbage and barboil each separately to take away some of the strong flavor. Cook the onions separately in some of the meat stock, and after the cabbage has been parboiled put it in the kettle with the turnips and carrots. About one-half hour before serving add pared potatoes. The meat may be returned to the kettle and reheated. Serve the onions and beets in separate dishes. Place the meat in the center of a large platter and place the vegetables attractively about it. Horseradish sauce may be served with the meat. It is made by soaking one-half cup of bread crumbs in milk, drain and mix with one cup well-drained horseradish, whip one-half cup of cream and fold in carefully the mixture of bread crumbs and horseradish.

Breakfast—Fruit, cereals, scrambled eggs, fried potatoes, graham gems, preserves, coffee and milk.

Dinner—Soup, Swiss steak with gravy, escalloped potatoes, buttered carrots and peas, sliced tomatoes, bread, fruit, shortcake, tea and milk.

Supper—Creamed codfish on toast, French fried potatoes, buttered turnips, lettuce, cottage cheese, bread, preserves, fruit gelatine cake, tea and milk.

Gelatine for supper dishes should be prepared soon after breakfast to insure its being firm. Chill thoroughly.

For Swiss steak pound flour into a piece of round steak on both sides. Season well and sear in very hot suet drippings until a good brown crust is formed. Add sufficient water to barely cover and simmer slowly one to one and one-half hours.

It is suggested, also, that the women serve themselves first. This is a good idea, because then they are rested and refreshed for the dinner period of hurrying about to serve the men.

Blue and White Tatting for Girls' Middies.

This pretty pattern is made with No. 30 thread in two colors, blue and white, with the blue on the shuttle.

With the white thread 6 d. s., 1 p., 2 d. s., 1 p., 6 d. s., 1 p., 6 d. s. Blue thread ring, 3 d. s., 5 p. woth 2 d. s. between 3 d. s., and close. White thread chain 6. Blue thread ring 3 d. s., 5 d. s. with 3 d. s. between, 3 d. s., close. White thread chain 6 d. s. Blue thread ring 3 d. s., 5 p. with 2 d. s. between, 3 d. s., close. White thread chain 6 d. s., join to white picot coming down. 6 d. s., 1 p., 2 d. s. 1 p., 6 d. s. with blue ring 6 d. s., join to middle p. of last

blue ring, 6 d. s., and close. White thread chain 6 d. s., 1 p., 2 d. s., 1 p., 6 d. s., 1 p., 6 d. s. With blue ring 3 d. s., 1 p., 2 d. s., 1 p., 2 d. s. Join to same picot with last two rings; 2 d. s., 1 p., 2 d. s., 1 p., 3 d. s., close. White thread chain 2 d. s., 1 p., 2 d. s. Now make five of these blue rings, joining each. Each has 3 d. s., 1 p., 2 d. s., 1 p., 2 d. s., 1 p., 2 d. s., 1 p., 2 d. s., 1 p., 3 d. s., and close. Between each ring, with white chain 2 d. s., 1 p., 2 d. s. After fifth blue ring chain 6 d. s (white), join to white picot, 6 d. s., 1 p., 2 d. s., 1 p., 6 d. s. Make the little blue ring of 6 d. s. Join to middle picot of 5th blue ring, which brings you to the top again.

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

Steaming of Vegetables Better Than Boiling.

Boiling removes many times more soluble matter than does steaming. This soluble material includes soluble proteins, sugars and the still more important mineral constituents. These mineral constituents represent the most important nutritive part of the green vegetable. The table given below is illuminating:

Percentage of loss of mineral matter by:

	Bleaching by boiling	Bleaching by steaming
Peas	24 %	1.6 %

This indicates that in the cooking of vegetables the steaming method is much to be preferred to boiling unless one uses for food the water in which the vegetable is boiled. The exception will occur in the blanching of the special vegetables from which one wishes to remove a strong raw odor or taste.—[Inga M. K. Allison.

A Compliment for Vesta.

Dear Young Folks:—Every time the paper comes I read the Young Folks' page. I think it is a nice, little, cozy corner.

I am thirteen years old and am in the seventh grade. I read Vesta's letter and I think she is a bright little girl. A girl twelve years old should just

wear her dresses below her knees. My mother says you are old enough to go to parties with your brother. I did when I was twelve. You must have a great deal to do if you do all the work, and I am sure you are a good housekeeper, too.

I never did know how Uncle Sam was named until the Young Folks told me.

I have a cat named Tom. He is yellow and white.

Let's all write more so we will have more letters to read. Bessie.

Poor Little Waif!

Dear Young Folks:—I am going to write to you and tell you about a little kitty I have for a pet. It is nearly three months old and is a wee little thing. Its name is Waif. We named it Waif because when it was little the mother cat would not have anything to do with it and one night it nearly chilled to death.

One day my mother and I were out in the garden and we lost it, but we found it under a potato vine fast asleep. Eula.

Takes Good Care of Her Garden.

Dear Young Folks:—As I have never written to your page before I am going to now. I enjoy reading the letters so much. I live on a 320-acre farm fifteen miles from the city. I am fifteen years old and am in the eighth grade. I have three brothers and one little sister. We have to walk a mile and a half to school.

I help my mother in many ways, and I have a great big garden for myself. I can sew, cook, bake, crochet and tat. Yesterday I cleaned my garden and pulled all the grass and weeds. I have some potatoes that I am going to sell, and also a big patch of onions. Onions are very high in price this year.

Best regards to all the little girls and boys who are readers of this page. Lillian.

How to Make Butter Scotch Candy.

Dear Young Folks:—I am a little girl six years old. I did not start to school last year, but will go this year. I know how to write some and can add and know all of the letters, both small and capitals.

We live on a farm six miles from town. I have a baby brother six months old.

I have four little kittens. I have no names for them. And I have a little dog that I call Cricket because he is never quiet.

I am going to tell you how to make butter scotch candy. I can make it by myself. One cup of sugar, one cup of sirup, one-half cup of butter, one teaspoonful of vinegar. Boil all together until it hardens in cold water. Then pour on greased plates. I hope some of you will try this because it is very good. Lila.

Three New Friends.

Dear Young Folks:—We have been reading your letters for some time, but this is the first time we have written. We are sisters, aged fourteen, twelve and eleven. We live in town and have two blocks to go to school.

We have three pet quail, one pet cat and a pet chicken. Will some of the young folks tell us what to feed the quail?

Two of us are in the seventh grade, and the other in the fifth grade. We go to Sunday school every Sunday. Margaret, Annabel and Sadie.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for August 5, 1917.

Manasseh's Sin and Repentance.

LESSON TEXT—II Chronicles 33:1-20.

GOLDEN TEXT—Let the wicked forsake his way, and the unrighteous man his thoughts; and let him return unto the Lord, and he will have mercy upon him; and to our God, for he will abundantly pardon.—Isaiah 55:7.

The reign of Manasseh was the longest of any of the kings of Judah. It is strange that a wicked king should have the distinction of the longest reign. This can be accounted for, perhaps, by the fact that the nation was in such a state that their idolatrous corruption needed to go to its fullest development. It seems to be necessary in a world of free beings, that their actions must go to a certain stage of development. It was so with the inhabitants of Canaan before that land was possessed by Israel. Israel was kept in Egypt until the iniquity of that nation was full. In this case doubtless the Lord permitted this to go on until the idolatrous practices would become extremely obnoxious.

I. Manasseh's Sin (vv. 1-9). Though he had the example of a good father, he with passionate endeavor gave himself up to the imitation of the heathen about him. This shows that grace is not inherited; a good father may have a bad son. It also teaches us that it is absolutely necessary to bring the grace of God into vital touch with our children, for that grace is absolutely essential to their salvation. Only his grace can counteract the downward pull of sin.

1. He restored the high places which had been destroyed by his father (v. 3). It is thus seen that he sought to undo the good work done by his father.

2. He erected altars to Baal (v. 3). The idols worshipped on these altars seem to have been images of licentious appearance, provoking the indulgence of the human passion. Therefore, with this worship was coupled the grossest licentiousness.

3. He introduced the star worship of the Chaldeans and Assyrians (v. 3). He even erected these altars in the house of the Lord, placing them on a level with God himself.

4. He set up Moloch in the Vale of Hinnon (v. 6). He not only encouraged this worship on the part of others, but he even caused his own children to pass through the fire.

5. He practiced magic, witchcraft, and dealt with a familiar spirit (v. 6). So gross were these practices that they did even worse than the heathen whom God had destroyed before the Children of Israel came into the land.

6. He rejected the Lord's testimony (v. 10). Doubtless the prophets had again and again admonished him, but he seems to have turned entirely aside from such remonstrances.

II. Manasseh's Chastisement (vv. 11-13). The Lord in grace used the Assyrians to chastise Manasseh, so as to bring him to see his evil ways. He was captured, perhaps while hiding among the thicket of thorns (v. 11), bound in chains and carried to Babylon. This was most humiliating. His hands were manacled, his ankles fastened together with rings and a bar.

III. Manasseh's Repentance. (vv. 12, 13). Fortunately, the chastisement had its desired effect. Manasseh was brought to his senses and turned from his evil ways. The steps in his repentance are as follows:

1. Affliction (v. 12). This was most severe. Bound with chains and dragged to Babylon. While this was severe, it was light in comparison with the sins which provoked it.

2. Supplication (v. 12). Manasseh had the good sense to cry out to God in this condition. It is the unmistakable evidence that God's chastisement is accomplishing its purpose. We are instructed in James 5:13 in time of affliction to pray.

3. Humility (v. 12). This is a common characteristic of penitent souls. Those who come under the hand of God always recognize it in their humble walk.

4. Forgiveness (v. 13). As soon as God sees the signs of penitence, he turns in mercy to the penitent and grants absolution for sin. No one needs to wait long to receive his forgiveness.

5. His kingdom restored (v. 13). Manasseh not only was forgiven, but he was actually restored to his kingdom. Those who truly repent, God will not only forgive, but he will restore (Psa. 32:3-5).

6. Apprehension of God (v. 13). Through this experience Manasseh came to know God.

IV. Manasseh's Reformation (vv. 14-20). Manasseh was not content with merely receiving God's forgiveness and restoration to his kingdom, but he sought so far as possible to undo the mischief which he had done.

1. He strengthened the fortification of Jerusalem, so as to make his people safe from the attack of a foreign foe (v. 14).

2. He removed the idols from the House of the Lord (v. 15). Through bitter experience he had come to know that an idol is nothing, that it could avail him nothing in time of deepest need.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Inclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date 1917 spring and summer catalog, containing over 550 designs of ladies', misses', and children's patterns, also some points for the needle. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

2191—Dress for elderly ladies. Pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 6⅛ yards of 36-inch material for a 36-inch size.

2018—Girls' one-piece dress, with sleeve in either of two lengths. Pattern is cut in 4 sizes: 6, 8, 10 and 12 years. It requires 3¾ yards of 36-inch material for an 8-year size.

2171—A pretty summer dress. Pattern is cut in 5 sizes: 6, 8, 10, 12 and 14 years. It requires 3½ yards of 44-inch material for a 10-year size.

2173—Dress for misses and small women. Pattern is cut in 3 sizes; 16, 18 and 20 years. Size 18 requires 4⅞ yards of 44-inch material.

1945—Child's set of short clothes. Pattern is cut in 5 sizes: 6 months, 1, 2, 3 and 4 years. It will require for the dress, 2⅝ yards of 36-inch material. For the drawers, ¾ yard, for the slip, 1½ yards, for a 2-year size.

Corset Cover 2048-Petticoat 2049—Some desirable underwear. The camisole 2048 is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 1⅝ yards of 36-inch material for a 38-inch size. The petticoat 2049 is cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. The underskirt requires 6 yards of 36-inch material with the flounce, and 4 yards without the flounce, for a 24-inch size. Two separate patterns, 10 cents for each pattern.

1804—A seasonable and becoming model. Pattern is cut in 4 sizes; 2, 4, 6 and 8 years. It requires 3½ yards of 36-inch material for a 6-year size.

2168—A practical apron model. Pattern is cut in 4 sizes: Small, 32 and 34; medium, 36 and 38; large, 40 and 42, and extra large, 44 and 46 inches bust measure. Size medium requires 6⅛ yards of 36-inch material.

1880—Boys' suit. Pattern is cut in 5 sizes: 6, 8, 10, 12 and 14 years. It requires 2⅛ yards of 36-inch material for the blouse, and 1 yard of 44-inch material for the trousers for the 8-year size.

2178—Girls' dress, with sleeve in either of two styles. Pattern is cut in 4 sizes: 4, 6, 8 and 10 years. It requires 3¾ yards of 36-inch material for an 8-year size.

2170—An ideal house dress. Pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires for a 38-inch size, 6⅞ yards of 36-inch material.

2195—A group of serviceable sleeves. Pattern includes all styles illustrated and is cut in 4 sizes: Small, 11 inches; medium, 13 inches; large, 15 inches, and extra large, 17 inches arm measurement. Medium size requires, for one pair of sleeves, 1⅛ yard for No. 1, 1⅜ yards for No. 2, 1⅜ yards for No. 3, and 1⅜ yards for No. 4, of 27-inch material.

Catalog Notice.

Send 10 cents in silver or stamps for our up-to-date fall and winter, 1917-1918 catalog, containing 550 designs of ladies', misses' and children's patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable hints to the home dressmaker.

Let's Eat More Cheese.

"More cheese might be used at home and on the farm to good advantage," is the advice of the dairy department at Iowa State College. It is one step toward food conservation, for the milk and buttermilk oftentimes wasted can be made into cheese which, pound for pound, contains about twice the nutritive value of meat and is a very good substitute for it. Following is a recipe for making the new buttermilk cottage cheese:

Use raw, sour cream buttermilk. Heat buttermilk directly from the churn to 136 or 140 degrees Fahrenheit; hold at that temperature for an hour before draining off whey. Stir buttermilk during heating and hold only enough to secure a uniform heating, this done to break up the curd as little as possible. If the whey does not show clear by heating to 140 degrees Fahrenheit bring heat to 150 degrees or slightly higher. After allowing heated buttermilk to stand for an hour run or dip whole mass into muslin cloth which is spread over some form of draining rack. A rack is easily made by tacking quarter-inch mesh galvanized wire on a shallow box in place of the bottom. When curd has drained sufficiently dry, salt to taste, about one ounce salt to four pounds curd.

The best cheese is made when a considerable amount of starter is used in the cream. If this is not done a small amount added to the buttermilk before applying heat will help the coagulation.

DAIRY

Curing a Sucking Cow.

ALMOST every dairyman knows of at least one way which, in his estimation, will keep a cow from sucking herself. Rather than bother with a cow of this kind, however, most dairymen are willing to let the animal go at a very low figure and be rid of her for once and all.

Ben Berg, of Lake Mills, however, has a lot of patience and when he saw a chance to buy the Holstein in the picture he decided she was a good cow and would not only raise excellent calves, but produce large amounts of milk herself. The cow was to all appearances a hopeless case, as her owner had tried various methods to prevent her from milking herself. Mr. Berg has devised what he thinks is the most effective system to stop cows from doing this. He places a surcingle over the cow's shoulders and right in back of the front legs. A stick fastened to the halter by means of a snapper comes back above the right front leg and is attached to this surcingle with a string. The stick is provided with a dull point which is forced into the side of the cow if she turns her head to the right in order to reach around. Failing in this she will try to reach her udder by turning her head to the left, but here the stick tied to the surcingle will hold her head effectively so that she cannot reach more than half way around.

The system is not cruel to the animal and at the same time prevents all possibility of the cow milking herself. In summer time a blanket can be thrown over the cow to keep the flies from bothering too much.

The cow in the picture has two records of over thirty pounds of butter fat in seven days. She also holds the thirty-day record for the state in her class.

The case is an example of how a highly bred cow with a bad habit is making good in spite of herself. Just a little patience and a simple contrivance has made this possible. In return the owner is getting large yields of milk and many excellent calves.

AN EFFECTIVE WAY OF PREVENTING A COW MILKING HERSELF—DEVISED BY BEN BERG, OF LAKE MILLS.

Milk That Stays Good.

To the Editor:—I am told by the folks down town that there is a great difference in the keeping quality of milk purchased from different dairies. Some will keep sweet a long time, while other brands will turn sour in a little while. There are dealers who treat their milk in one way or another, by pasteurizing or sterilizing, so that it will keep good indefinitely, but some people do not find this milk entirely satisfactory. In fact, a certain physician told me he never used pasteurized milk himself, because it made gas in his stomach and bowels, so he recommended milk just as it came from the cow.

How is it that there is this difference in untreated milk? I can answer that question in great measure. It is due largely to the care the long-keeping milk receives before it leaves the farm. On some farms only the most trivial pains are taken to keep the milk good, while on others no pains are neglected in this direction.

For instance, I now have in mind a young farmer who cools his milk down just as soon as it is brought from the milking stable. Up to the present he has been in the habit of setting the cans in a kettle or tub and pouring cold water around them, stirring the contents of the cans in the meantime.

Just now, however, this progressive young man has been putting the finishing touches on a homemade cooler. In his milk house he has made some forms of old boards, laid down a cement floor and built a deep trough for the milk cans. The work was all done by the farmer and his hired man. They dug down about two feet below the surface of the floor, filled in with stones, gravel and cement, leaving at one end a space for the deep reservoir. Around the top edge of the front of the trough a hardwood board protects the cement from being chipped off when the cans of milk are set over into the water. It is a very creditable piece of work, with the provisions for putting in and letting out the water.

Milk thus cooled down and stirred until it is free of the animal heat is bound to keep far longer than that which has not been subjected to any such treatment. Take milk that is bottled without proper cooling and aerating and it is pretty apt to sour in a little while, especially if it be not kept in a good place after it is delivered. Many cellars are wholly inadequate for the storage of milk, or anything else, for that matter. It is not always possible for the consumer to get ice, and the bottles of milk must be kept in any out-of-the-way place until needed. The wonder is that it keeps as well as it does.

After all, it is a question of the man. Some are not satisfied until they have done their best to make all they do the very best possible. These are the men who may really be called the salt of the earth. Subscriber.

Kalamazoo ALFALFA & ENSILAGE CUTTERS
Before you buy an ensilage cutter, find out all about the *Kalamazoo*—the *only* cutter on the market having a center shear. The Kalamazoo has an unbreakable malleable knife *wheel*—not a knife cylinder. Two knives are constantly cutting toward *center*—absolutely no side-thrust. No wasted power. This center-cutting knife wheel delivers a steady, even flow of ensilage to the blower—clogging is absolutely impossible. Another big feature—
The Knife Wheel is the Blower Fan
You can't realize what a power saving this means until you see a Kalamazoo in operation. All wearing parts are easily adjustable. Cutting adjustment is on shear bar only. This makes adjustment of knives simple and easy compared with other cutters.
Get a Kalamazoo—save power—save cutting cost—feed your herd on less acreage. "Do your bit" by helping produce America's biggest saleable crop.

County Exhibits Contests.

The Milwaukee Journal each year offers a cup for the best county exhibit at the Wisconsin State Fair. It is expected that a larger number of counties will be in competition for this cup this year than usual.

The cup is a beautiful piece of the silversmith's art. The base is five inches high, while the cup itself is fourteen—a total of nineteen inches. From handle to handle it measures eleven inches.

On one side the lettering is already

done, with the exception of the name of the county which will receive the cup for the best exhibit, and reads: "Presented by the Milwaukee Journal to ———— county for the best county exhibit in the Wisconsin State Fair of 1917." It will be on exhibit in one of the downtown stores just previous to the fair, which will be from September 9th to 15th.

Cow-Testing Reports.

Wood County Association No. 2.

To the Editor:—The following is a list of the forty-five-pound cows in the Wood County Cow-Testing Association No. 2 for the month ending June 30th:

Feed Better Cut Silage
It pays. Shows a big profit in dollars and cents, as proved by users of Silver's "Ohio." This machine cuts silage unlike other silo fillers. Reduces it to a mold-proof semi-pulp that packs solidly, expels all air, releases the sugar juices, ferments evenly and properly. Free from shreds and leaves. Makes the high quality silage that brings biggest milk yields from dairy cows, puts weight on fattening stock. Write for book that proves wisdom of "Silverizing" silage.
Silver's "Ohio"
The Logical Silo Filler
Cuts better silage and more of it in the day's time. A simply built giant of strength and big capacity. Backed by 62 years' manufacturing experience, by the pioneers of silo fillers. Many big leading features.
Knives that cannot spring and let "air-pocket" shreds and leaves get into the silo; patented friction reverse and single lever control, automatic beater-feed—saves a man's work at the feed table; heavy 12-gauge sheet-steel fan case, real "galvanized" pipe, low speed fan—fills highest silos with ease. 7 sizes—40 to 300 tons a day. 4 h.p. gas to big tractor power.
Two Books FREE—Our catalog—and book on Silverized silage. Write today.

Live Stock and Commercial Notes.

Gathered by Representatives of The Wisconsin Farmer.

Shanks Will Put Up Great Summer Duroc Sale.

THE sale of Durocs to be made August 14th by W. N. Shanks, Worthington, Minn., is such as to attract wide attention and patronage. Mr. Shanks has listed 45 head, one-third of which are sows bred to the 1,000-pound Investor. Lady Top Notcher 11th is one of these. She is litter sister to the top of the sow sale last winter. This sow has raised three litters of pigs in which she raised 23 pigs. She is full sister to the $800 High Model Top and to other herd boars of note. Lady Top Notcher 14th is a full sister to her and will also be included in the sale. This sow is a member of the litter that was shown with her dam, as being the best ever produced on this farm—this was at the opening of one of the sales held by Mr. Shanks. The other sows are mostly yearlings by the noted High Model, a few by Grand Model 12th. Col.'s Lady by King the Col., her dam by Osborn's Prince of Cols. This sow raised 10 pigs in her spring litter. She is a good sort and being bred to Investor should make her a most desirable addition to any good herd. Lilac Blossom 2d is another good daughter of King the Col., that is a real brood sow, raised eight pigs this spring. The sow end will be attractive throughout. The 15 fall boars are mostly by High Model, there being a few only by Grand Model 12th and by Royal Gano. These fall boars are the pick of 35 fall boars—everyone is fit to head a good herd. Among these are sons of old Lady Top Notcher 6th that were sired by Grand Model 12th. Others are out of daughters of King the Col., Col. Gano, King Gano, Crimson Wonder 3d. The spring boars comprise the greatest attraction ever listed by Mr. Shanks. Five of them by Pathfinder and ten by Investor. Investor is the one great boar to follow on High Model and King the Col. sows. Here are herd headers. Mr. Shanks was indeed fortunate when he secured this great boar. The mating of Investor with the immense sows in the Shanks herd has produced results beyond the greatest expectations of their owner. Plan to be at the sale and to reap the reward of the efficient mating practiced by Mr. Shanks. In writing for catalog please mention this paper.—Adv.

A Johnson on Each Corner.

YOU have all read or heard about Johnson Brothers, of Royal King fame. They live near Lake Crystal, Minn. There are four brothers in the firm all living on the same section, one on each corner, and Duroc hogs on each farm. Royal King is back on the job again after having something wrong with one of his legs causing serious lameness. Some breeders would like to have you believe that Orion Cherry King stuff have poor feet, but if you will visit this farm and see Royal King and his get, you will be convinced that somebody has made a mistake. The boys made a real buy when they added Fancy's Victor to their herd. He is a wonderful breeding boar and individually he will compare with the best. This is the only boar that we know of sired by old Fancy Col. If you want to see big sows with high backs and good feet visit Johnson Bros. We will not go into details about all the good sows and litters, there are too many of them. Just remember that this firm have a herd of sows as good as money could buy. They are carrying over many fall sows for the winter sale and they will certainly be attractions. Their ambition is to put up the best offering in the state on the 8th day of next January. —Adv.

Reese's King.

LOUIE REESE, Brooklyn, Wis., has a good herd boar that he calls Reese's King. He is a two year old and is by Pfander's old King of All and we think he is the only boar with this line of breeding in the state. Besides being a good individual he is a good sire, for the pigs by him will compare with any we have seen. A daughter of Fessy's Orange, a line-bred A Wonder, has a nice litter of eight. There is a litter on the place by Big Long Bob 2d, a grandson of Big Bob. The dam of the $100 gilts in the Madison sale raised another nice litter by Reese's King. The gilts and boars that Mr. Reese has for sale are all right and will please you. Their breeding is the best big-type and the pigs have been well grown. If you are going to buy Polands it will pay you to buy early. Write him and please mention The Wisconsin Farmer.—Adv.

An Old Timer.

J. A. DOERR, Viroqua, Wis., has been breeding and selling Chester Whites for a good many years. He has never made a great deal of noise, but has been selling hogs as fast as he could raise them and has been enjoying a lucrative business. Doerr Chesters can be found all over this state and adjoining states and his past customers are his best advertisers. If you want a boar or a gilt he can supply your wants and at a price you are willing to pay. Write him and mention this publication.—Adv.

F. B. Schaub, Honey Creek, Wis.

MR. SCHAUB'S Holstein herd is now headed by King Klorinda Counsellor, grandson of King Sejis Pointia and out of a 15-pound daughter of Peter Mutual De Paul. Her five nearest dams average 28.70 pounds butter in seven days. He is now offering for sale four females in his herd at a very low price considering their breeding and individuality. Three are yearling daughters sired by a son of Knight Errant. The other animal for sale is a two year old and a full sister to one of the yearling heifers—a splendid individual and just fresh.—Adv.

At P. W. Young's.

WE recently spent the day with P. W. Young, Prosper, Minn., and one needs a day to see all the good ones that Percy has to show. You will want to spend about half of the time with the three herd boars. It's a real treat for anyone that appreciates good hogs to see Young's Big Joe—he is a remarkable boar in every respect. There may be better two-year olds, but they are scarce and we have never seen one. He weighs over 1,000 now and will weigh 1,100 or over by October. If you want to see a big one that is smooth take a trip and see Young's Big Joe. After you have spent about an hour feasting your eyes on this boar take a little time for Orange Wonder, another 1,000-pound boar that has all the good points. Many of the good judges say Orange Wonder is the best boar in the herd. What would happen if we all saw things in the same light? The writer has never seen a Poland China boar that appealed to him more than Master's Giant, the senior herd boar on this farm. This grand old boar is now five years old, there is not a wrinkle or crease on him, he has a perfect foot and a wonderful back. Even at this age we think he could be made to weigh over 900 pounds and would make a creditable showing. We are perhaps partial to this boar because we know all the sows and boars in his pedigree for several generations back and every one was a good one. We will say again that no breeder has three better herd boars. Those that attended the Ed Hendricks boar sale last fall will remember that P. W. bought a boar sired by the Oakland's Equal boar out of a Black Jumbo dam. This boar cost Percy $40, but he is in the $500 class now and if he is not in the money at Hamline some one has a choice junior hid. This shows what can be done with good seed when given proper care. Young has some great boar pigs and they are for sale. They are guaranteed to please and no poor ones are sent out. We do not hesitate to recommend this herd or the breeder, it is a great combination. Write for his sale catalog containing the breeding of the various boars he has for sale. Address P. W. Young, Box 100, Prosper, Minn., and please mention The Wisconsin Farmer. —Adv.

At F. M. Washburn's.

WE found F. M. Washburn, Lake Crystal, Minn., with over 100 pigs, the majority being by the one and only Chief Invincible. Mr. Washburn sold most of the sows that were bred for early farrow, in his January sale, consequently, he has not as many early March pigs as in previous years. His pigs are good and with a few months more age they will compare with earlier pigs. We need not say a great deal about Chief Invincible. He is conceded to be one of the best boars of the breed and he is making good in Washburns' hands. The best thing we have seen sired by the highly advertised Pathfinder is a sow on this farm. She is truly a great sow and would be a credit to any herd in America. She is raising a fine litter by "Chief." Mr. Washburn contemplates holding two bred sow sales next winter. His first sale will be held January 9th and another one some time in February. He has several fall boars by "Chief." If any of our readers are interested in boars of this age get in touch with the owner. We will have more to say later.—Adv.

Siebecker at Baraboo.

BARABOO is the center of a thriving live stock country, there being many herds of various breeds around this very pretty town. One of the better swine breeders of that locality is L. R. Siebecker, who has Duroc Jersey hogs. With this issue of The Wisconsin Farmer Mr. Siebecker starts a card that will appear regularly from now on. We saw the pigs he has for sale, a short time ago and they are dandies and will please the man who gets them. He will sell you gilts or boars and at a price you are willing to pay. His pigs are in excellent condition, as their owner is a good caretaker as all stock on the place will show. This fact alone is worth consideration in buying live stock. Get his prices.—Adv.

W. G. Bartholf's Durocs, Burlington, Wisconsin.

W. G. BARTHOLF'S crop of spring pigs consists of 45 head. They are mostly sired by Outlook Cherry King by Brookwater Cherry King. They are doing splendidly and a number of very promising boar pigs were noticed in the lot. Mr. Bartholf also has on hand three fall boars sired by Outlook Cherry King and out of some of his best brood sows. These animals are in fine condition and anyone in need of such a sire would do well to correspond with Mr. Bartholf in reference to these animals. Mr. Bartholf also has one particularly fine litter by a son of Pathfinder.—Adv.

F. A. Swoboda's Holsteins, East Troy, Wisconsin.

MR. SWOBODA is now using Sir Ormsby Johanna De Kol 37, sired by Sir Ormsby Johanna De Kol, that has 31 A. R. O. daughters, including a 33.34-pound cow. He is now offering for sale two bull calves and two heifer calves sired by his herd bull. These youngsters are all sired by Johanna De Kol 37, good individuals with perfect top lines. Write Mr. Swoboda for more information regarding these calves.—Adv.

Dobson & Eastman Ready for Business.

WITH this issue of The Wisconsin Farmer, Dobson & Eastman, the popular Poland China breeders, of Lancaster, Wis., advise the public that they are ready to supply their wants. It is useless for us to go into detail about the hogs bred and raised by this firm, their history is well known to all lovers of this great breed of hogs. Their spring pigs weigh from 100 to 160 pounds and from that weight you may know they are good ones. They will sell boars or gilts and they guarantee satisfaction. They also have a few fall boars for sale and have some sows bred to farrow in September that can be spared. Everything on this farm is cholera immune, which is an important item to many buyers. Burlie advises that his show herd is coming fine and he hopes to make a strong showing at Milwaukee this fall. They will have a junior yearling boar at the fair that is a real one and he should weigh over 700 pounds by fair time. Every hog they show will be of their own breeding. There is no breeders in the state that we are more willing to recommend than Dobson & Eastman. They are absolutely on the square and whatever you buy of them must be satisfactory.—Adv.

Moss Brothers, East Troy, Wis.

AS we visited the Moss Brothers recently we were greatly impressed with their enthusiasm for the Holstein business and were glad to notice the good judgment that they used in selecting their foundation cow, Vevie Bell of Elkhorn. That is a rare individual and one that is capable of transmitting her exceptional individuality. She is the dam of Knight Errant Queen, the foundation cow of Mr. Dunbar's herd that was dispersed last spring. Moss Brothers are now using a son of Vevie Bell of Elkhorn in their herd and have for sale a good bull calf out of a sister of Knight Errant King that has 28.55 pounds.—Adv.

It Pays to Buy a Proven Sire.

HERE is a real opportunity as Mr. Emmons Blaine, of Lake Mills, Wis., has decided to sell Canary Homestead Oak De Kol 89469, one of his senior herd sires. This bull has stood at the head of one of the best herds in the state of Wisconsin for several years and has to his credit already 20 A. R. O. daughters, including a 22.82-pound junior two year old. He is a 29-pound son of Homestead Junior De Kol, as well as a grandson of Jesse Fobes Bessie Homestead, a 34.96-pound cow that has upon various occasions attracted much attention as a producer and as a show cow. He is in splendid condition and is guaranteed a breeder straight and right in every particular. —Adv.

John Swenson Has the Goods.

WE will frankly say that John Swenson, Willmar, Minn., has the best bunch of Duroc pigs that we saw in Minnesota. Other breeders have some good ones too, but John has about 150 and we only saw five that could be called tail-enders. The pigs by the grand champion, E. J.'s Crimson Wonder are fine, which proves that this boar is a worthy sire, as well as a show boar. He is looking fine and we believe he could "come back" if showed again this year. The pigs by Big Wonder are dandies and Mr. Swenson says that as long as he continues to produce the goods he will retain him in his herd. We feel safe in saying that this breeder has one of the finest lots of big sows to be found anywhere in the Northwest. We hear a lot about 700 and 800-pound sows, but they are as scarce as 1,000-pound boars, but Swenson has them as big as the biggest. He topped several sales last winter and the sows that he purchased have raised

GALLOWAY'S TRACTOR

"Pulls Anything, Anywhere, Anytime." That's what users say!

A four wheeler delivering 12 full horse power on the draw-bar (with a surplus of 4 h. p. by actual dynamometer test) and 20 h. p. on the belt (with a surplus). Four cylinder, valve in the head, water cooled, long stroke, modern gasoline motor, transmission a unit with motor. The Galloway Efficiency Farmobile gets its name because of the small amount of power lost between engine and draw-bar. We have exclusive right on this patented transmission. By actual test its sustained efficiency at the draw-bar is 86.7%. That's why it "pulls anything, anywhere, any time." Will do any portable engine job, sawing, silo filling, corn shelling, shredding, pull 28-in. grain separator, feed grinding, pumping for irrigation, etc. Will handle three 14-in. bottoms 8 to 9 in. deep in clover and timothy sod. For building roads, dragging and grading it cannot be excelled. Double chain drive, gears run in oil tight case in oil bath; rear wheels 58 in. high; 15 Hyatt roller bearings and 6 ball bearings used in the Galloway Efficiency Tractor. Extra heavy duty motor, Schebler carburetor, Eiseman magneto, Pierce governor, engine never races; bull wheel sprockets and chain, covered; only two levers to control it; one man operates tractor and plow with ease. As far ahead of one and two-cylinder tractors as four and six-cylinder motor cars are ahead of the old style one and two-cylinder cars.

good litters for him. From the present outlook there will be a wonderful January sale offering. More later.—Adv.

Watrous' Holsteins, Troy Center, Wis.

MR. WATROUS, who has the distinction of developing the highest record junior four year old record cow at her age in the state, has recently purchased Hill Vale Sir Ormsby from D. H. Howell, Waukesha. It will be remembered that he already has ten very creditable A. R. O. daughters to his credit including a 24.7-pound two year old that recently sold for $2,150 at the Waukesha county Holstein sale. We feel like congratulating Mr. Watrous and Mr. Howell in this transaction because it shows Mr. Watrous was keen to recognize the merit of this splendid sire and that Mr. Howell showed good judgment in selling his bull to a man who is capable of making records that will reflect additional credit to his ability as a buyer of good producing cows. Mr. Watrous made a 26.3-pound record on Star Vale Aaltje Pauch II. Mr. Watrous is also offering for sale his herd bull that is a full brother to Aaltje Johanna, his 28.56-pound junior four-year-old cow, and is also offering two bull calves of exceptional individuality and breeding. One of these is out of the 28.56 junior four-year-old cow and the other from a 26-pound cow. The following is a list of the A. R. O. daughters of Mr. Watrous' new herd sire, Hill Vale Sir Ormsby: Brookvale Ormsby Snowball, four years, 20.3 pounds in seven days; Brookvale Ormsby Snowbird, junior two year old, 14.18 pounds in seven days; Brookvale Ormsby Jewel, senior yearling, 16.43 pounds in seven days; Brookvale Ormsby Netherland, junior four year old, 27.33 pounds in seven days; Brookvale Ormsby Netherland II, junior two year old, 16.78 pounds in seven days; Brookvale Ormsby Anna, senior three year old, 21.32 pounds in seven days; Brookvale Ormsby Korndyke, senior two year old, 24.70 pounds in seven days; Brookvale Ormsby Queen, five year old, 24.40 pounds in seven days; Brookvale Ormsby Snowbird, senior three year old, 17.16 pounds in seven days; De Frule Fayne Ormsby, two years, 16.76 pounds in seven days.—Adv.

Poland News of Special Interest.

ONE of the best herds of Poland Chinas in Minnesota will be sold October 17th. This sale is the Gerlich & Barker herd, of Mankato, known all over the United States. This will be a dissolution sale and everything will positively be sold. Mr. Barker has purchased a farm and in order to close the partnership deal between he and Mr. Gerlich the sale will be held on the above date. Both men have agreed not to bid on a sow or reserve any for their own use, consequently breeders can attend this sale with the assurance that they will get a chance at the poor ones and the good ones alike, of course, there won't be any of the former. There will be about 140 spring pigs and they are good ones, about 25 fall sows all good ones and all of their breeding herd, show sows, etc. The three herd boars will be the main attractions. This will include Choice Expansion, G. B. Giant and Big Expanso, three extraordinary herd boars in the 1,000-pound class. This will be an opportunity for Wisconsin breeders, for with this large number to sell there are bound to be bargains. Keep the date in mind, we will give the details of the sale later.—Adv.

McKerrow's Big Sheep Sale, Pewaukee, August 15th.

WISCONSIN sheep breeders will have a rare opportunity to select high-class show stock and breeding rams August 15th, when Geo. McKerrow and Sons Co. will sell at their farms, Pewaukee, Wis., 120 head of home-bred and imported Shropshire and Oxford sheep. About half of the offering will come from their recent importation and the remainder from their own matchless herds that represent 24 years of intelligent breeding. No herds in the country have been more consistently in the lime light at the leading fairs these many years than McKerrow's Shropshire and Oxford herds. This fall instead of showing, as is their usual custom they are going to hold a great sale and sell the stock they would ordinarily have shown. There will be 50 Shropshire herd headers and 25 Oxford herd headers of exceptional merit in the sale. Also 20 head of Senator Bibby's get. Senator Bibby is one of the greatest rams of the breed. His get has won more prizes than that of any other ram. See advertisement on page 16.—Adv.

A. G. Swoboda, Troy Center, Wis.

MR. SWOBODA is now offering his senior herd bull, No. 75146, sired by Korndyke Pontiac Pointer King, that has eight sisters that together average over 30 pounds in seven days. Mr. Swoboda's sire is from an A. R. O. cow and is mostly white and is in good condition—a guaranteed breeder, and can be purchased at a very reasonable figure. He also has for sale a bull calf sired by Sir Ormsby Johanna De Kol 37 and out of an A. R. O. half sister to Finderne Hollingen Fayne, a world-record cow.—Adv.

Ackerman Has the Goods.

SOME time ago when we called on W. F. Ackerman, Glen Haven, Wis., he had the best bunch of pigs we had seen at that time and we have just been advised by another party who recently saw them that "Will has the goods this year." We believe that Ackerman made a mistake when he let A's Big Orange go. Here was one of the good boars of Wisconsin individually, and as a breeder, we don't know of a boar that bred more to type and uniformity than A's Big Orange. Not only that, he sired big litters. If the fact that Mr. Ackerman has size, quality, big litters and good breeding in his Polands means anything to you write him. His pigs have been well grown, they have as much size and more quality than many we have seen. If you want gilts he has them for sale or he will sell you a pair or trio at a reasonable figure. Note the advertisement that appears in this issue and when writing for details please mention The Wisconsin Farmer.—Adv.

KING PONTIAC SEGIS VEEMAN

(134190) IS FOR SALE

A 29.29-Pound Son of King Segis Pontiac Count.

King Segis Pontiac Count is a grandson of King of the Pontiacs, that has more thirty-pound daughters than any bull and is sired by King Segis Pontiac, that has sired more high-priced bulls than any sire.

King Segis Pontiac Count also has the distinction of siring the greatest producing junior two year olds of the breed. He has three junior two year olds that average 28.46 pounds butter in seven days and five junior three year olds that average 31.37 pounds and 610 pounds milk in a week. The herd at which King Segis Pontiac Count stands at the head leads all others in prize winners for A. R. O. work for the year just closing.

For further particulars concerning King Pontiac Segis Veeman write to Edgewood Stock Farm, Burlington, Wis.

A 27.81-lb. BULL

THE ABOVE IS THE AVERAGE RECORD for his dam and sire's dam. His sire is out of the famous 35.43-lb. cow, Pontiac De Nijlander. His dam has a four-year-old record of 20.20 lbs. butter. She has a 30-lb. daughter and a 25-lb. dam. A little more black than white; well grown and of exceptionally good conformation. Born February 1, 1917. For pedigree and further information, address
A. M. ANDERSON **WHITEWATER, WIS.**

45 HEAD

15 Grand Brood Sows bred to Investor.

15 immense fall boars, the choice of 35 good ones, mostly by HIGH MODEL. Few by Grand Model 12th and Royal Gano.

15 outstanding spring boars, 5 by PATHFINDER, 10 by INVESTOR.

OUTSTANDING INDIVIDUALITY THROUGHOUT

THE INVESTOR AND HIGH MODEL

combination produce BIG, high-backed, high-standing, heavy-boned stuff. They command the admiration of the most critical judges and buyers.

OUTSTANDING INDIVIDUALITY THROUGHOUT

EVERY animal listed has been most carefully selected. Not a single excuse will be needed. An offering combining great size, rare quality, high backed, heavy boned, and perfect feet. Investor has proven to be the one perfect sire to use on these High Model and King the Col. sows. He is the PEER OF ALL SIRES; recognizes no competition; is outstanding in size, type, quality. Superiority stamps his offspring. A son of Investor is a fitting herd boar for any progressive breeder who is catering to the best BIG TYPE. A most cordial invitation is extended to all. Come. Catalogs ready. Kraschel and Duncan, Auctioneers. W. S. Steele and T. P. Shreve represent this paper.

THE WISCONSIN FARMER

VOL. XLVI. NO. 32. THURSDAY, AUGUST 9, 1917. WHOLE NO. 1854

MILKING MACHINE STANDS TEST

TWO and a half years ought to be a long enough time to give a milking machine a fair trial. E. C. Peebles, of Lakeview Stock Farm, near Fond du Lac, has used his milking machine every day since March, 1915. In all this time he has never had any trouble from garget, sore teats, nor have any of his cows been milked by hand because the machine could not do the work. The only cows that have been milked by hand are those that were doing official work.

"The milking end used to be the biggest part of our farm work and was the cause of considerable trouble with all our hired help," said Mr. Peebles. "Now the milking is the easiest part of our chores. One man can take care of twenty-five cows in one hour and ten minutes and do the separating and feeding of the calves at the same time. Two men can take care of the twenty-five cows in forty minutes."

According to Mr. Peebles, the biggest part of the trouble experienced by farmers with the milking machine can be avoided when the standard which is exacted of the mechanical milker is not placed too high. Some men want a milking machine to milk the cows absolutely dry. This is an unreasonable request, and were the milker so perfect that it would do this, it would be of no particular advantage. The cow's udder must be carefully watched, more so when she is milked by a machine than when milked by hand. The perfect milker would make men careless in this respect and any injury to the cow's udder would not be discovered until it had taken on serious proportions. "I strip my cows after the milker has finished, and in this way I know just exactly whether the machine has been left on the cow long enough or too long, so that I can correct the mistake at the next milking. The stripping also gives me an opportunity to see that everything is in good shape with each cow."

There is no hurry necessary in finishing up the cows. The man leisurely strips the last milk from the cows and by that time the machine has finished with the next pair. Each two cows require approximately four minutes to be milked by the machine. With Mr. Peebles' two two-units, two men can take their time, following up the machine, carry the milk to the separator, run the separator and feed the cows.

Mr. Peebles milks from thirty to thirty-five cows the year around and is only able to do so because of the milker. The same sets of rubber tubes which came with the machine are still in use. When the milking is over steam from a boiler in the separator roo is forced through the pipe line, thoroughly sterilizing them. Hot steam is also sent through the tubes and the teat cups. During the time they are not in use they are submerged in a tank of running water. The quality of Mr. Peebles' cream and milk has been pronounced excellent at the factory. Mr. Peebles has never owned a grade cow. He took the farm from his father about four years ago, but as he has been on the place since a boy, he influenced his father to change the herd from a grade Holstein to a pure-bred Holstein herd during his last years. The farm contains about 160 acres, of which forty are in alfalfa, thirty in oats and fifty in corn. The rest is taken up by pasture, and some additional hay land is rented each year. The herd consists of sixty-five head, including the young stock.

From a very modest beginning in dairying this farm has developed within the last ten years into a highly profitable dairy establishment. In 1906 for the month of January the cream check was $43.20. For February it was $33.13, and for March $38.18. In January, 1917, the check was $379.94; in February $388.92; in March $491.30; in April $610; in May 498.96. This gives him an average of over $400 per month returns from milk and cream alone, aside from which he can still sell his surplus stock and the cows that produced the milk and calves.

E. C. PEEBLES' BARN, WHERE MECHANICAL MILKER HAS HAD THOROUGH TRIAL.

FLOSSIE MAUDE, 24.57 POUNDS OF BUTTER FAT IN SEVEN DAYS. OWNED BY MR. PEEBLES.

There is some fine Holstein blood represented in the herd of Mr. Peebles. The herd sire, Sir Rigtje Johanna, is by Eir Elmen Johanna and out of Eagle Rigtje Jessie, with a seven-day record of 32.71 pounds of butter fat at four and a half years of age. The sire traces back to Sir Hengerveld De Kol and many other famous sires of the Holstein breed. The offspring of Sir Rigtje Johanna are bought up as fast as they are produced. "If I had a dozen bulls on hand today I could get rid of every one of them in short order for good prices, as buyers are continually trying to purchase any surplus stock that might be on hand," said Mr. Peebles.

The Peebles farm was one of the the first in Fond du Lac county to have a silo. The increase in the dairy herd made it necessary to provide more feed and another silo was erected considerably larger than the first about two years ago. The silage has all been used during the last year with barely enough left for summer feeding. Mr. Peebles figures that from thirty to thirty-five good cows well handled will bring him as much profit as a larger herd containing a greater percentage of inferior milkers. His largest profit for one month was made in April of this year, when twenty-eight cows netted him $610. Two of the twenty-eight were on their last month of milking and were practically dry, so that the returns were in reality made on twenty-six cows.

But Mr. Peebles would not think of milking again without the help of the machine. As a time-saver and labor saver it is worth more to him than any other thing on the farm.

Our readers will be glad to get the benefit of this actual experience. For some time Wisconsin Farmer editors have been looking carefully into the claims of the mechanical milker, and, as is the case with the tractor and other new things coming into general use, we prefer to give our readers the benefit of practical experience rather than to simply hand out claims made. In the main experience with milking machines is very satisfactory, especially where the dairyman will take the same time and pains to handle his machine Mr. Peebles has taken. Quite a few of our readers have felt that the milker was all right for the immense big dairy, but that the smaller dairyman could not afford it. While Mr. Peebles' herd is somewhat above the average there are hundreds of men in Wisconsin who have about the same number of cows. Any dairyman will easily recognize the value of Mr. Peebles' machine as a labor saver in these days when farm help is scarce and when it appears that for some time at least the help problem is likely to grow worse rather than better. It is a time when every possible labor saver—real labor savers which do not cost so much as to make their use prohibitive—should be employed by the dairymen of this state. A loss in production is unthinkable and the limit of human energies on the farms of the state has about been reached. At all events we are very glad to give our readers the benefit of this practical experience from a Wisconsin dairyman well known by name even though many of our subscribers may not enjoy a personal acquaintance with him. Management of a dairy farm, such as Mr. Peebles operates, is not so idealistic that the same success may not be obtained by thousands of others.

DAIRY COWS AND FEED LIKE THIS LEAD TO THE MECHANICAL MILKER.

The Potato Storage Problem.

Temperature of 36 to 40 Degrees Desirable—Bins Should be Small and Depth of Pile Not Over Six Feet.

THE storage of potatoes of the main crop can be accomplished most satisfactorily throughout much of the United States in the dugout pit or potato cellar in some of its various forms of construction, says a recently published farmers' bulletin of the United States Department of Agriculture, "Potato Storage and Storage Houses." In general, the bulletin says, no attempt is made to store potatoes of the early crop, since usually they are sold for immediate consumption.

While the dugout storage house is in most general use, concrete or masonry houses with frame superstructures are, perhaps, most satisfactory in cold climates.

The primary purposes of storage, it is pointed out, are to protect the tubers from extremes of heat and cold and from light. Account also must be taken of conditions of humidity and ventilation and of the size of the storage pile.

The temperature should be the highest at which potatoes can be maintained firm and ungerminated, and which will at the same time hold fungous diseases in check. Experiments of the department with artificially refrigerated storage indicate that 36 degrees Fahrenheit is sufficiently low for all practical purposes and that in the earlier portion of the storage season a temperature of 40 degrees Fahrenheit is just as satisfactory as a lower one except where powdery dry rot infection occurs.

All natural light should be excluded from potato storage houses, because when the tubers are exposed to even modified light they are soon injured for food purposes. A practical rule in regard to humidity, the bulletin already mentioned says, is to maintain sufficient moisture in the air to prevent the wilting of the tubers and at the same time to keep the humidity content low enough to prevent the deposit of moisture on the surface of the tubers.

If potatoes are piled in too large piles they may become overheated and deteriorate. Six feet is a good maximum depth to which to pile tubers in bins, and the area covered by each pile also should be limited. A good plan is to insert ventilated division walls at intervals through the pile or bin. These may be made by nailing relatively narrow boards on both sides of 2x4 uprights, one-inch spaces being left between the boards. General ventilation for the whole storage house usually is accomplished through ventilating shafts in the roof.

The possible ways to store potatoes, says the bulletin, are pits or earth-covered piles, in dugout pits or potato storage cellars, in insulated wooden structures, in substantial masonry or concrete houses and in artificially refrigerated storage houses. The latter two methods are the most expensive. Pitting is the most primitive method of storage, but if properly done on well-drained locations is satisfactory in so far as the preservation of the potatoes is concerned. The chief drawback to pitting is that the potatoes are not always easily accessible in the winter.

The dugout pit or potato storage cellar is probably more widely used than any other type of storage space. Fitted with water-tight roof it is especially popular in the central portions of the United States. In the arid and semi-arid sections a type with sod or dirt roof is in most general use. As a rule, the excavation for the cheaper structures of the dugout pit or cellar type when erected on level or nearly level land does not exceed three feet. The soil removed from such an excavation, particularly if the dugout is of any considerable size, is ample for banking the side and end walls and also for the roof. The cost of construction may be greatly modified, according to the character of the location.

In the cheaper dugouts, where the soil is of such a nature as to remain intact, it is allowed to form the side and end walls, the roof being supported on plates resting on the soil and held together by boards or joists. This form of construction involves a deeper excavation and a constant element of risk from a cave-in. In the more expensive and substantial structures the side and end walls are built of concrete.

Insulated frame potato storage houses are not used very extensively. As a rule, they are better adapted to southern than to northern climatic conditions. The construction feature of such houses is the thorough insulation of their walls, ceiling, doors and windows. This type of storage house is not to be recommended for northern locations, nor is it advocated for the South except where poor drainage conditions will not permit the use of the dugout or cellar style of house. It is not recommended, because it cannot be so economically constructed, nor does it furnish as good a type of storage as the properly ventilated cellar storage house.

The Aroostook type of storage house, with concrete or masonry basement walls and wooden superstructure, seems to be distinctively a product of Maine, and so far as has been observed is not found to any extent outside of the state. It is an expensively constructed house and is almost always located on a side-hill or knoll in order that advantage may be taken of a ground-level entrance. That such houses have proved satisfactory to the potato grower in Maine is evident from the fact that practically no other style of potato storage house is in use in that state.

Book for Farm Library.

Instructive Volume for Young People as Well as for Farm Owner.

Under the title "Productive Plant Husbandry" a 460-page volume from the pen of Kary C. Davis has just come from the press and The Wisconsin Farmer deems it a privilege to recommend this volume to its readers. It is designed to meet specifically the needs of growing boys and girls who are interested in plant problems. The soil itself is given a good deal of attention in this volume and all the principal farm, garden and vegetable crops are taken up in the order of their importance. Then there is a great list of crop enemies, including weeds, insects and diseases, that are considered in the minutest detail. The volume contains 452 illustrations and a contemplation of this fact alone will give some idea as to the attractiveness of the volume, because illustrations always add interest to the text. It is not claimed by the author that this volume is designed to assist the farmer in making more money out of his crops, but it certainly will add to the interest of the work to those who are dealing with the soil or handling any form of plant life. The book will prove intensely interesting to growing boys and girls. The regular publisher's price is $1.75 and arrangements have been made by The Wisconsin Farmer to supply it to its readers at this price.

Clover Seed.

To the Editor:—For many years Wisconsin has had an excellent reputation for the quality of the clover seed produced in the state, and there was a time when Wisconsin-grown clover seed would command the highest price on the market. This condition was of great benefit to the farmers of our state who were growing the various kinds of clover seed, because it allowed them to secure considerably higher prices than could otherwise have been obtained. The whole situation is being changed, however, by the presence of weed seeds in the clover seed. The seedsmen tell us that it is no longer possible to sell Wisconsin-grown seed, particularly alsike seed, at a premium, but that because of its condition due to weed seeds, it is necessary in many instances to either sell it at a lower price than can be obtained for other clover seed or else to go to considerable expense to clean it before it can be sold.

Perhaps the worst seed in the state which infests the clover seed is the Canada thistle. It is not often that the seeds of Canada thistles are found in red clover, because the seed crop is usually taken from the second growth and the thistles are prevented from seeding by the first cutting. In alsike, however, where the seed is taken from the first crop, the thistles may become extremely bad and usually ripen at the same time the clover seed does. It seems to be almost impossible to find Wisconsin-grown alsike clover seed at the present time which does not contain more or less Canada thistle seed. This seriously injures the sale of the seed and is rapidly destroying Wisconsin's reputation as a clover seed producing state. Much of the Canada thistle seed could be kept from getting into the alsike clover seed if farmers who are producing this seed would go over their alsike with a mower just while the clover and the Canada thistles are in bloom and clip off the thistles. The thistles grow so much taller than the clover that it is possible to cut them off and prevent them from going to seed without doing very serious injury to the clover. Farmers of this state who are planning to cut alsike clover for seed should take every care to prevent the Canada thistles growing in the clover from going to seed. The quality of the alsike clover seed grown in Wisconsin is excellent and the only thing that prevents it from obtaining the highest market price is the presence of the Canada thistle seeds in it.

We recognize the fact that the labor conditions this year are unusual because of the great amount of wet weather which has kept farmers from keeping their work up to date and that it may be impossible in many instances for farmers to take time to clip the thistles in their clover fields, but wherever it is possible this should be done. There is no question that the time and labor required would be well paid for in the higher price which can be obtained for the seed.

A. L. Stone, State Seed Inspector.

Destroying June Bugs.

To the Editor:—In response to the Pierce county subscriber regarding June bugs, I wish to say that about dusk they will settle and feed on butternut, hickory and burr oak trees. Spread a large canvas under the tree, place a tub with water in it on the canvas, hang a lantern close down to the center of the tub. Then get up in the top of the tree and shake each limb as you descend. When one gets down there will be some June bugs to scoop into the tub. A Subscriber.

The sheep tick is a wingless parasitic fly which spends its entire life on the sheep. It obtains its food by puncturing the skin and feeding on the blood and lymph of the animal. The irritation thus caused, especially in the case of lambs, is great, and the constant drain of blood may in time become serious. Infested sheep are so restless that they do not feed well and are in general less thrifty than tick-free flocks. These conditions hamper the growth of wool and in general lower the market value of the sheep. From a purely economic point of view, therefore, dipping is a profitable practice.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

SHALL WE HAVE PEACE?

THE time is ripe, in my opinion, for us to counsel together over the possibilities of an early peace. There may be some who regard these possibilities as remote; I do not. Already I can see tiny rifts in the black clouds, forerunners of the dawn's bright rays, the dawn that shall mark the beginning of the end of all war.

On a titanic scale, war is simply a dispute between men. It is a lawsuit between two farmers over a division-line fence, magnified many millions of times. The same rules and principles apply to war, therefore, which apply to our individual differences. Many of us have learned—often by bitter experience—that it is well, at times, to settle our differences outside of court; that litigation is costly, protracted and often wholly unnecessary. What would peace be now, between the fighting powers of the world, save a settlement outside of court of the dispute which sent us leaping at each other's throats? If it is desirable to arbitrate our personal differences and save court costs, is it not a million times more desirable to arbitrate our national disputes and save war costs: millions of human lives, billions of dollars?

One of the parties to the present dispute between nations has evinced a desire to talk peace. Some among us question the good faith of this party in such a situation. But because the man whom we are suing in court, or who is suing us, is the owner of more land than we own, or lives in a larger and finer house, or won the last lawsuit in which he was engaged, is that any reason why we should prejudice our own interests and refuse to hear what he has to offer, at least? We reserve the right to reject his proposed settlement outside of court, if his terms do not appeal to us as fair and right. But shall we not at least hear them, particularly when the lives of our loved ones are at stake, as well as all the property which we have gathered together by such hard work and self-denial and with so many high hopes of the future?

Certain utterances have been made within the last few days, by German and Austrian statesmen, which lead me to believe that peace is not out of the question. Let me mention one or two of these. Within the last week the Austrian-Hungarian minister of foreign affairs, doubtless with the sanction of the German military authorities, made this public statement:

> I am absolutely convinced the entente will never succeed in crushing us, and, since in our position of defense, we have no intention of crushing the enemy, the war will end sooner or later in a peace by understanding.

If "sooner or later," why not before your son and mine are forced to lay down their lives in a foreign land, heroic sacrifices to a war which might have been stopped if the spirit of compromise could only have been magnified sufficiently to cover national disputes as it does individual ones?

Again, the same Austrian-Hungarian minister is quoted as expressing the hope that a peace may be concluded that will "prevent forever" the recurrence of another war. Is this not a sentiment to which all of us will heartily, yea, fervently and prayerfully, subscribe? Who among us desires war? Who among us but would stop this war, and all wars for all time to come, if it were in our power? Shall we not grasp at the chance to restore peace when it is held out to us, not questioning too much the sincerity of the offer until we can learn the details and think it over? Better a "peace by understanding," a million times over, than war with a continued frightful loss of human lives, with fields and feed-lots, factories and stores, homes of low and high degree, confiscated by war's awful needs or leveled by the shot and shell of the enemy.

I believe we should stand by the president; I believe we should continue our war preparedness without the slightest interruption, working night and day to raise our army, strengthen it, equip it and prepare it to take the field the equal of any army on earth. I believe we should set about immediately to become masters of the air, that our aviators may spy out the plans of the enemy and frustrate them. I believe we should work incessantly to solve the submarine problem and to reclaim the freedom of the seas from those who would despoil us of the rights of commerce. I believe we should put our house in order for whatever might occur, no matter at what cost. But if the hand of Divine Providence should see fit to stop our armies before they reached the battlefield, would we not all drop on our knees and thank Him who had saved us from the great sacrifice? And who knows what means Providence may use to hold back the blade from descending upon the necks of our loved ones, what hand may be the one to stop the awful slaughter? Let us hear the peace terms and then counsel together as to whether or not we shall accept them.

WHY THE FARMER SHOULD BE EXEMPTED.

I HAVE the most positive convictions on the subject of the exemption of farm labor from the army draft, as my readers must surely know by this time. I believe it is fully as patriotic and necessary to bring our crops through to a bountiful harvest this year, and next, as it is to take up arms against the enemy. That being the case, I have repeatedly urged that every one of the district exemption boards (which shall decide this important matter) should contain at least one farmer, who would understand farm needs and conditions and be in a position to render justice to the farm boy. I am indeed pleased to find that the farm has been given this representation, in practically every district of the grain belt. But my campaign has not stopped with this. I am now endeavoring to open the eyes of the city members of these boards to the importance of exempting farm labor. A few days ago I received the following letter from a city member of one of the district exemption boards here in the grain belt, to whom I had written a note of congratulation on his appointment. The letter shows an open-mindedness, and a desire to learn and be influenced by the opinions of others, which I find most commendable. The letter follows:

> Dear Mr. Pierce: I wish to thank you very much for your expressions of satisfaction on my appointment to this Board. I think I realize the importance of it.
>
> I would appreciate it very much if you would write me confidentially your views as to the exemptions that should be allowed for farm laborers and farmers themselves.
>
> Of course, you appreciate on the one hand the necessity of the government's obtaining a sufficient number of soldiers, and, on the other hand, the necessity of raising the crops. The difficulty, to my mind, is in distinguishing those men who cannot be spared from those who can readily be replaced. I appreciate that on a farm, to a certain extent, there is expert labor needed; while, to a very great extent, it is merely labor which could be performed by men who are not wholly physically fitted for military service.
>
> Of course, we do not know how many of these cases will come before us, but we will try to do the right thing with reference to them.
>
> Very truly yours, ——. ——. ——.

In reply, I outlined my views, as I have expressed them from time to time in these columns, urging with all the force I could command that the farm boy be allowed to remain in the field and feed-lot, to the end that production might be maintained and increased, and the world be fed and clothed. It might not be amiss to print my reply, in full, as follows:

> My Dear Mr. ——. ——. ——: In reply to your favor of recent date, I wish to say that I have some very positive convictions on the subject of the exemption of farmers from the military draft, and I welcome the opportunity to outline them to you. I am glad, indeed, to learn that you realize the immensity of the trust and responsibility placed upon you, and I am confident that you will do your duty patriotically and in such a manner that no man shall be drafted unjustly nor any be exempted unfairly.
>
> It is my honest, earnest opinion that few, if any, farmers can be spared to the colors this year or next. The president has called on the farmer to increase production to the utmost. The success of the armies in the field and the sustenance of those who remain at home, not only here, but abroad, depend upon this. Production cannot be maintained at its maximum without every worker now engaged. Our duty is to make easier, rather than harder, the task of those upon whom countless millions must depend for their food and raiment.
>
> I call your attention to the fact that here in the grain belt of the Middle West our crop acreage, as a whole, is larger than it was last year. Our winter wheat fields are yielding as high as sixty and seventy bushels to the acre. Abandoned winter wheat fields have been hastily seeded to other crops (thanks to an army of tractors) and will yield abundantly. Our oats fields are returning a magnificent crop. The corn situation is reassuring. We shall produce bumper crops this year, if every man now engaged in field and feed-lot is allowed to remain there, without hindrance. Wheat farmers are planning for a still larger area to be sowed to wheat this fall. The armies now in the field, and soon to be placed there, must be fed next year (and the next, and the next, should the war drag along) more through our efforts than through the efforts of any other people. Production must continue to be increased, else hunger and famine and defeat of the flag must inevitably ensue.
>
> I realize that agricultural exemption must be granted in individual cases, rather than as a class immunity. But no boy or man, within the draft age, should be taken from the farm if his place cannot be filled, without an hour's delay, by an equally efficient and capable substitute. Farming has become a fine art; it is a matter of brain as well as of brawn. It no longer consists merely of plowing the earth, dropping in the seed and awaiting the harvest. It is a mixture of engineering, chemistry, physics, mathematics and various other sciences. I am not arguing that a college education is indispensable to farming success; but I am arguing that practical experience is indispensable. You cannot make a city boy into a farmer in a twinkling, no matter how anxious he may be to become one, no matter how great our national crisis. Production depends on efficiency now as never before. The secretary of agriculture has repeatedly stated, within recent weeks, that this is no time to experiment with unknown crops. Neither is it any time to experiment with unknown workers.
>
> I might cite innumerable instances to you to illustrate the point I have in mind, but one will have to suffice. It is a simple one, conclusive for that very reason. It has happened often and will happen many more times if farmers are obliged to depend upon unskilled, inefficient help.
>
> A near neighbor of mine, a farmer who had planted 150 acres of corn, found himself in the middle of the cultivation season without experienced help. Through a city labor bureau he obtained a man who had had little or no farm experience; willing enough, perhaps, but unacquainted with farm conditions and needs. This man was given a trustworthy team and set to work cultivating the corn. He made a sorry botch of the job from the very first. To make matters still worse, the team (a perfectly trustworthy one, which had never before given any trouble whatever) took matters into their own heads the second day and a runaway ensued, the cultivator being smashed into bits and the horses spoiled beyond all redemption. This man had been warned against just such an occurrence, not because the team was in the habit of running away, but because that farmer knew (as do all farmers) that a team which has once run away is never to be depended upon again; that it is, in fact, practically ruined for farm work. To this day, that particular team is nervous and high strung and can be handled only by the most skilled driver. My farmer neighbor has tried out other men of this type and not one of them turned out to be skilled enough to do the work. Today he and his sixteen-year-old boy are working their 240-acre farm by themselves.
>
> I could duplicate that farmer's story hundreds of times, but the point I want to make is just this: Farm help must be skilled and experienced. The average-sized farm here in the grain belt is about 160 acres. At least two able-bodied men are needed to work a farm of this size the year around. In harvest season, a third man is absolutely necessary. To draft farm boys or men so as to reduce the number of workers, PER FARM, below this minimum number needed, is so to impair agricultural efficiency as to endanger production and military success. I believe our district exemption boards will make a very serious mistake if they take any farm worker, within the draft age, who has worked on a farm for three years or more, who presents affidavit to the fact that he is a skilled worker, who cannot be replaced by an equally efficient worker immediately, or who gives evidence of becoming more useful within the immediate future, than any one who can be found to take his place. In brief, I believe that 95 per cent of the boys and men drafted from the farm should be exempted, and that only those should be taken who are individually incompetent, whose places can be filled without delay or trouble, or whose parents have sufficient money to continue the cultivation of the farm without unbearable financial loss to them. I believe our district exemption boards should show in most positive manner, by their prompt and determined action, that the man in the furrow is doing his bit fully as much as the man in the trench, and that he also fights who stays at home to make the farm yield to its utmost, that there may be no danger of empty stomachs and unclothed backs among the boys who are found to be more useful under the colors than in their wonted occupations at home.
>
> I trust I have made myself clear. I am taking the liberty to enclose some editorials along this line which I have written recently for my farm papers. If you will do me the honor to read them I believe you will learn my opinion in minute detail. I cannot make myself too emphatic on this matter, and I hope that you will see things as I do when the time comes for you to make an official decision.
>
> Once more thanking you for your courtesy and with highest personal regards I remain,
>
> Sincerely yours, JAMES M. PIERCE.

I hope I have succeeded in proving my point. I might have written at much greater length, citing innumerable other instances of farmers' losses from unskilled, inexperienced city help, but the members of the exemption boards are busy men; I preferred to send a short, concise letter, supplementing it with copies of the articles of the same nature which have already appeared in this page of mine. I do not propose to stop here, however. I plan to send a copy of this letter to every member of every district exemption board in the entire grain belt, hoping that by so doing the importance of exempting farm labor may be impressed upon all of them, and our crops may be taken through to maturity, from one end of the fertile Middle West to the other, without a single acre being lost. There is nothing more important at the present time than this, in my opinion. Uncle Sam must raise an army. He must put that army in the field. But in doing this he should not reduce production of that which sustains life: Our herds and our crops. To take the farmer or his help from the field and feed-lot is to bring about hunger and famine; it is to cause the innocent to suffer. I shall work and protest against it to the very end.

James M. Pierce

THE WISCONSIN FARMER

THE WISCONSIN FARMER, Madison, Wisconsin

Wisconsin's Campaign for More Silos.

The present campaign to increase the number of silos in Wisconsin surpasses in effort and enthusiasm anything of its kind that has been launched in recent years. Although most of the meetings to encourage farmers to build silos for this season's corn crop have already been held, still much educational work remains to be done, and throughout the coming fall and winter it will be continued until the farmers of the state are thoroughly acquainted with the use of silage for stock feeding. Back of the movement stand the state agricultural college, county soil associations and progressive farmers in all parts of the state. Dairymen, especially, are in sympathy with the campaign, since they have learned to look upon the silo as a foundation pillar of their business.

Starting this year, the campaign is especially timely. A new situation confronts us, which has no parallel in past years. All food supplies are scarce, because vast quantities must be diverted from their usual channels to feed the millions of men at the battle front who can produce nothing. Grain which was intended to feed live stock is needed for human consumption, and yet the demand exists for the usual production of meat, milk and milk products. Obviously the dairyman's problem consists in finding other feed than grain to supply his cows. So far the best solution seems to be in the use of silage, but silage cannot be produced without silos—hence the need of a silo campaign.

In this regard there is another situation which must not be overlooked. The acreage of corn in Wisconsin this year considerably exceeds that of last year, but the crop is late and much of it may never mature in time to escape frost. With a silo it can be saved, but without one the frost may catch it and leave the farmer with only a supply of inferior fodder. While fodder makes a satisfactory feed, silage is more desirable, because it yields more food material per acre of land and suffers less waste in harvesting. Careful experiments show that from 10 to 25 per cent of the food material in cornstalks is lost in broken leaves and stems and in fermentation when they are cured in the shock. The loss in food value of silage will not exceed 5 or 10 per cent under normal conditions. In no other way than with a silage can so much digestible feed be produced on a given area of land. Since three tons of silage contain as much digestible nutriment as one ton of hay, an average yield of eight or ten tons of silage per acre would be considerably more than the two tons of hay which the same land would ordinarily produce. Besides silage is usually a sure crop, while no hay crop can be claimed until it stands safely in the stack or mow.

Of course, silage cannot be fed exclusively with best results any more than can corn or hay, because it falls short of being a balanced ration. Some grain and dry roughage must supplement it, but their amounts may be relatively small. When thirty or forty pounds of silage per head are fed to good dairy cows, the concentrates may be cut down to about eight or nine pounds without decreasing the milk flow. In this connection, however, it must be remembered that animals differ a great deal in their individual food requirements and the effect of silage on each animal must be watched. It may cause trouble with some cows, particularly when it is first used. But when the cows become accustomed to it in the ration it stimulates the milk flow and for milk production it provides a cheap feed of unquestioned importance.

When these facts are brought to light not many farmers will question the value of a silo. Perhaps the silo campaign has already convinced many that silage should have a place in their feeding operations. Then the next step will be for them to act on their convictions. The kind of silo need not cause much concern, since any silo that is air-tight, smooth inside and sturdy enough to stand the strain will prove satisfactory. Practically all the silos made by companies who have faith enough in their product to give it full publicity may be depended upon. There are many good types of wood, stone, concrete and tile, and the farmer can take his choice. The important thing is to choose now, for silo filling time will soon be at hand.

Superintendents and Judges.

Men of wide experience and reputation as specialists in different lines of farming and animal husbandry have been picked to act as superintendents and judges at the sixty-seventh annual Wisconsin State Fair and Exposition, to be held at State Fair Park, West Allis, September 10-15, 1917.

Farmers of Wisconsin are well acquainted with practically all of the department superintendents, including farm crops and county exhibits, E. L. Luther, superintendent of farmers' institutes; bees and honey, N. E. France, state apiary inspector; education, George W. Davies, Sauk county's superintendent of schools and emergency food agent; horses, W. K. Caldwell, Morrisonville, of the State Live Stock Breeders' Association and leading authority on horse breeding; horticulture, N. A. Rasmussen, of the State Horticultural Society and a successful commercial orchardist; poultry, Geo. W. Hackett, North Freedom, commercial judge and producer of poultry; sheep, Ira M. Chryst, prominent member of American Society of Equity; swine, James Dillon, director of the Wisconsin Live Stock Breeders' Association; tractor demonstration, F. M. White, college of agriculture; young people's clubs, T. L. Bewick, state leader of young people's agricultural club work.

These are some of the well-known men who will pick the winners in live stock and the best samples in farm products: Clydesdale and Shire horses, George Hutton, superintendent of University Farm, Madison; beef cattle, E. A. Trowbridge, of Missouri Agricultural College, formerly of the Wisconsin College of Agriculture; dual-purpose cattle, Andrew Boss, University Farm, St. Paul; dairy cattle, except Brown Swiss, Hugh G. Van Pelt, Waterloo, Iowa, formerly with the Iowa Agricultural College; milk and cream, Donald R. Mattson, dairy school, University of Wisconsin; butter, G. H. Benkendorf, dairy school, University of Wisconsin, and C. E. Lee, dairy and food commissioner.

Other judges of miscellaneous products include J. G. Moore, college of agriculture, horticulture exhibits; A. L. Stone, college of agriculture, grains and forage crops; J. G. Milward, college of agriculture, vegetables.

Farmer Must Have Railroads' Help.

The publisher is in receipt of a letter from a large manufacturer of silos who could have sold several hundred silos, so he writes, in Wisconsin this year if the railroads had been in position to ship the materials promptly. Many silos are being erected in Wisconsin this year; in fact, this year and next will probably be banner years in the construction of silos in this state. Many silos are now in course of construction and some are planned which will still be built this season. The silo saves feed and the farmer with two good silos is going to be able to release some grain to add to the enormous quantity which will be needed to feed our home folks, our armies and the people and armies of our allies. The silo would be important if we did not need it to help save grain, as silage has repeatedly been demonstrated as the cheapest form of dairy feed, and, furthermore, experiments show it to be among the very best feeds for stimulating milk production. It is folly for us to preach more silos if freight conditions are to be such that materials cannot be put on the ground for the farmer's needs. Some way must be devised to get these materials into the hands of the farmers, and not only materials for erecting silos but for erecting other needed farm buildings and equipment and also for transportation of implements needed in farm work. How shall we be able to accomplish much by crying greater production, if we shall withhold from the farmer the equipment and tools which he must have to insure such production? The state council of defense, not only our council in Wisconsin but those of other states as well, should carefully investigate and discover whether materials, equipment and tools needed on farms are held back because of poor railroad facilities. If it is found that this charge is true in many instances immediate action should be taken to relieve the situation.

ANOTHER PLACE FOR MUCH-NEEDED FARM HELP.

Work the Soil to the Limit.

A reduced fertility supply will be one outcome of the present cropping program because every many is using his best endeavors to excel all former records. We have in mind one instance where an eighty-acre field was plowed up this spring after being in grass for forty years, the owner's purpose being to do his level best to add to the grain supply of the world.

One of our subscribers, in the following communication, outlines a plan that will, if carried out, bring the soil to its limit in production:

In developing methods to get the best possible returns from a small farm of forty to eighty acres or even less, I have found it necessary to give careful attention to soil conservation. Long years ago I became a firm believer in the feasibility and practice of double cropping, but this system will soon exhaust the soil, unless a thorough application of manure is provided every year, and an intelligent scheme of rotation is adopted.

Either in operating a small dairy, or raising stock for market, one must be prepared to feed through frequent periods of summer drouth. This is absolutely necessary if the milk output is maintained on a basis that will fulfill contracts and bring in the cream checks regularly. Corn comes late in the summer and fall, and in addition to this the winter supply of hay must be provided. Summer feeding seems to be of ever-increasing importance in dairy districts. Then the growing scarcity, or advancing value of land constitutes another question. It needs little argument to show that we ought to improve our farming lands, if possible, accomplish as much on forty acres as formerly we did on eighty or one hundred.

I have always secured practical results by sowing rye for fodder. This is ready to cut and put away late in May, and it can be followed with millet, late corn, cane, feterita, or a dozen different things. Then you come face to face with the problem of soil exhaustion. It would not be wise at all to repeat that process regularly without something put back, and lots of something. Yes, manure is good, but how about getting enough? It can be seeded to clover following the millet, and it should be devoted to clover for a couple of years. Then after that it is fit for almost any crop. If the clover cannot be successfully seeded in the fall, then don't let the soil lie bare, but sow to rye so as to not waste any elements, and plow early and sow the clover with a nurse crop of oats in the early spring.

When a field has produced corn for two seasons, it is proper then to seed to oats and clover, or if you have manured the soil sufficiently, the clover may be left out and the oats followed by late fodder corn, with rye following this. This gives the land a pretty severe trial, but what are we keeping the land for, and had we not just as well work the soil to its full limit? Two years with clover and good applications of manure will give it strength to do lots of work, and I think we are not doing our duty unless we work it to the limit, both ways. Feed the soil liberally and crop it heavily.

Pastures are getting poor here and if the weather continues dry long in many cases the cattle will be consuming the fodder planted for next winter. But even the farmers who have a good sized alfalfa field must push forward on intensive lines. They need the greatest possible diversity consistent with reason, and this they can best secure by giving intelligent study to the system of double cropping and practical rotation, and this is only the duty of every farmer. Are we going to do it and reap good harvests in future years, or will we just plug along and find our farms soon about gone?

This subscriber might have gone one step further and recommended the application of artificial fertilizer. The supply of manure made available each year is only enough to fertilize a very small percentage of our total crop area and after we have used the manure to the limit and clovered the land as much as is practicable there are still great possibilities ahead that may be realized as a result of applying the kind of artificial fertilizer that is best adapted to one's land. Potash is literally off the market, but we have an almost unlimited supply of phosphoric acid, so that in working the soil to its full limit we will fall short of the mark in many instances if we lose sight of the fact that it is possible to greatly increase production and to increase the profit in a given crop by using phosphorus in one form or another.

Work of Alpha Literary Society.

How Farmers' Organization Works for Pleasure and Profit to Its Members--Contributed by Mary Birr, Supervising Teacher.

ALPHA LITERARY SOCIETY, of Morgan, Oconto county, Wisconsin, is three years old. It was organized to interest the boys and girls outside of school in general reading, in reading farm journals, magazines, dairy newspapers and worth-while books.

The first meeting was in a home. Special invitations were sent to each boy and girl in the district, urging their attendance at this initial meeting and explaining its purpose. About twenty were present. Two or three chapters from "Timothy's Quest," by Kate Douglas Wiggin, were read. Everyone was very much interested, and it was decided, upon the suggestion of someone present, to finish reading the book at subsequent meetings. This naturally led to a discussion of the value of an organized club. Before the gathering adjourned the club was legally organized.

At the second meeting, officers were elected, and it was agreed upon that meetings be held regularly every Wednesday evening at the schoolhouse. Everyone who wished to join was asked to write his name in the secretary's book and pay a fee of 25 cents annually. Any boy or girl in this or adjoining districts over ten years of age is eligible for membership.

At the fourth meeting a simple constitution was adopted, and the club was named the Alpha Literary Society of Morgan, the word "Alpha" being inserted because it was the first club of any kind organized in this community.

In the beginning the work was confined to the reading of the book named and a short period of parliamentary drill. Roberts' Rules of Order was used; the drill was conducted by members of the club, but the teacher was the guide. The following winter the story read was dramatized and with the proceeds from the entertainment was bought an organ and two lamps for the school.

The character of the programs has changed from time to time, always based on the needs of the members. Beginning with the second year the programs included recitations, debates, readings, talks, social times and topics relating to local neighborhood affairs. During the winter months of the past year the meetings were really night schools, as this outline of the work done will indicate:

Song.
Reading, by two members, ten minutes. Kipling's "Captain Courageous" and Hale's "Man Without a Country" were read.
Arithmetic, twenty minutes. Farm problems and simple work in fractions, decimals and percentage.
Spelling, thirty words.
Agriculture, ten minutes. Two topics, one assigned, based on farm bulletins, one optional, based on farm journals.
Current events, ten minutes. Two topics, one assigned topic, one optional.
History. Smith's "History of Wisconsin." Report of one chapter at each meeting.
Business meeting and parliamentary practice the balance of the ninety minutes the meeting was in session.

During the months of June, July and August the club meets once in two weeks. The following are some of the topics and talks given at the last three meetings:

Object lesson on folding and displaying the flag.
Flag salute.
Lightning—cause and effect.
Weeds and how to eradicate them.
Clara Barton, founder of the Red Cross.
Cyrus McCormick, inventor of the self-binder.
History of the potato and its diseases.
The common housefly and its danger.
The cabbage worm.
Russia—area, population, surface, climate, products, government, etc.
Value of cultivation and how to cultivate.
Spelling match.
Short readings.

The club had two social meetings the past year, one a marshmallow roast and a community picnic. To the latter everyone in the district was invited. They had a speaker, an abundance of good things to eat and lots of fun.

During the winter they gave a home-talent play called "Back to the Farm." This play is published by the University Extension Division of Minnesota and costs 10 cents per copy. The proceeds from this play was $75, $25 of which was donated to the Red Cross. Every girl member of the club is a member of the Red Cross, wears a button, and is ready to help in any way she can.

Each year the club has had a traveling library from the Traveling Library Commission at Madison. They also own many of the government farm bulletins. We hope to affiliate with the State Reading Circle next year and have each member work for a reading circle certificate.

The club now has a membership of thirty. It is hoped that eventually it will emerge into a community club which will include everyone in the community as an active member.

I believe the club is accomplishing the purpose for which it was organized. There are evidences that the boys and girls enjoy reading more than they did before; they appear more interested in, and are in closer touch with, what is happening in the county, state and nation; and there has grown up between the members an increased spirit of neighborliness, good fellowship and loyalty.

Silos.

To the Editor:—This letter, or article, is authorized and inspired by the State Council of Defense. It is a present, pressing necessity, from a national standpoint, not only that the greatest possible corn crop be produced, but that it be saved in the most valuable condition with the least possible waste. To do this farmers must have silos. Silos will increase the feeding capacity of the farm at least 25 per cent. To increase the carrying capacity of an eighty-acre farm 25 per cent by the addition of land would cost approximately $2,500. Do it by building a $250 silo—build a better one if you can. It will not only be to your financial advantage to build and use a silo, but it is a patriotic duty as well. To feed more live stock—produce more meat, milk, butter and cheese, is the duty of every farmer at this time when the world is hungry and our nation is in a war that will test to the uttermost both the fighting and producing resources of the country.

A silo on every farm is the present war emergency demand. It is a demand of modern, profitable farming in times of peace as well. Everyone should build one this year. If the corn crop matures and is good the silo will be necessary to get the greatest feeding value out of it. If it does not mature—is killed by the frost before it ripens, then you need the silo more than ever. You can get very good results by siloing frosted corn, vastly better than you can get from the crop harvested in any other way. Frosted corn makes good silage, if harvested within a few days after being frozen. Harvested in any other way neither the grain nor the fodder is of much value.

By all means build a silo and fill it full for the winter's use. It will come nearer making for your live stock "a sweet summer time" of the cold winter months than anything you can do for them. Silage is good for all live stock kept on the farm.

The man who has a silo knows from experience the value of it. It is his patriotic duty, and a neighborly privilege as well, to tell the silo story to his friends who are without this necessary modern farm equipment. He can become an effective soldier of his country and a friend of hungry, starving children by enlisting as a missionary to urge silo building. Do it now. Make a list of friends with whom you have influence who are without silos, visit them, or ask them to visit you, and talk out the silo subject. This will be real service to the country and to your neighbors.

Mondovi, Wis. W. L. Houser.

To insure an adequate supply of canned goods for the army and navy the defense council's supply committee asked all the country's canners to reserve 12 per cent of each canner's pack of peas and corn, 18 per cent of tomatoes and 6 per cent of salmon.

30 Per Cent of the Corn Crop's Feeding Value Is in the Stalk

Whether you cut your corn and put it in the silo, or cut it and feed it to your stock in the feed lot, you save money—because thirty per cent of the entire feeding value of the corn crop is in the stalk. You get the use of all of it.

There are times when you can save even more than this by using a corn binder. For instance, when the corn is late in maturing, and there is very apt to be frost before it is out of the way, then it can be cut at the proper time and the entire feeding value, most of which otherwise would be lost, can be turned into big profit.

John Deere Corn Binder

A Labor and Crop Saver

Inspect the Power Carrier—a great improvement.

The John Deere Corn Binder saves corn that is lost by binders equipped with the old style tooth carrier. The power carrier delivers into the windrow all loose fodder that is discharged onto it with the bundles. *Requires no leg power* or effort to operate it. It places all the *bundles out of the way* of the horses when three horses are used abreast.

This carrier is *always ready* to receive the bundles, is easily and quickly removed, and is flexibly connected to the machine—works satisfactorily over uneven ground. In going over ditches, it is not injured. Its weight balances the machine, making the binder lighter draft.

The John Deere Corn Binder misses but little, if any, corn. The gatherers have a wide range of adjustment and are easily controlled to keep the points close to the ground in corn that is down. *Ample capacity* and *prompt elevation are assured* by the clearance in the throat and the flexibility of the long, adjustable throat springs.

Neater bundles are made because there are three packers, the long third packer working close to the butts. The knotter is the same as used on the John Deere, the Better Grain Binder. It is the *most accurate knotter* for the *greatest length of time*, as it has hardened wearing parts.

The John Deere Corn Binder can be turned quicker than the horses turn. There is no dragging of binder at any time. *Square corners can be turned* and the horses are relieved of neck weight. The all-steel, quick-turn tongue truck makes this possible.

Write to us for free book, "The Better Binder."

A Bigger Yield From the Same Field

Manure well shredded and spread evenly gets the best results. It goes farther. Plant roots get all of its plant food. On any field that you have been manuring by hand you get approximately a 25 per cent increase in crops by using

The John Deere Spreader

The Spreader With the Beater On the Axle

Ask any farmer who uses a John Deere Spreader. *How much would that mean to you in these years of high crop prices?* And you'll find there is a saving of 50 per cent in time and labor.

Beater on the Axle is found only on John Deere Spreaders. Does away with chains, clutches and half the castings otherwise necessary. *Means better spreading, fewer repairs.*

Revolving Rake which feeds manure to beater evenly, and Ball Bearing Apron Drive, securing frictionless apron travel with no racing, are other exclusive features.

Spreader only hip-high—easy to load. Big drive wheels—light draft. Easy to operate—only two levers—a boy can run it.

Write for free booklet on the John Deere Spreader.

Big Book Free

Better Farm Implements and How to Use Them

America must produce more food. Labor-saving implements will play an important part in increased crop production.

This book tells all about a full line of labor-saving farming implements. Tells how to adjust and operate many of them. A practical farm implement encyclopedia. Worth dollars. Illustrates and describes the following machines: Walking and Riding Plows, Tractor Plows, Disc Plows, Disc Harrows, Spring Tooth and Spike Tooth Harrows, Corn and Cotton Planters and Drills, Listers, Alfalfa and Beet Tools, Grain Drills and Seeders, Riding and Walking Cultivators, Lister Cultivators, Mowers, Side Rakes, Loaders, Sweep Rakes and Stackers, Hay Presses, Grain and Corn Binders, Corn Cutters, Stalk Cutters, Kaffir Headers, Manure Spreaders, Portable and Inside Cup Elevators, Corn Shellers, Wagons, Farm Trucks and Buggies. This big book will be sent *FREE* if you state the implements in which you are interested and ask for Package X-640.

Eighty Years Ago

the John Deere steel plow appeared in the agricultural world. Because it met a critical situation and solved it, where other types of plows had failed, it was recognized as the leader of plows, and under its leadership was accelerated the wonderful agricultural development of America.

That plow formed the standard for other John Deere implements—and today each class of John Deere implements is a leader in its field because the basic idea is right.

JOHN DEERE MOLINE, ILL. THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

JOHN DEERE, MOLINE, ILLINOIS

In and Around Wisconsin

A step in wool preparedness is to be taken at the Great Lakes Wool Convention, to be held in Chicago, August 21st and 22d. Wisconsin, Michigan and Minnesota are expected to occupy a prominent part in this convention. Millions of acres of grazing land in the northwestern states are to be offered to offset the 50,000,000 acres of sheep range which has been taken by homesteaders. Representatives of the federal government, state experiment stations, railroads, packers and stockyards interests, wool growers, manufacturers, bankers, sheep breeders and feeders, etc., will be present at the meeting and discuss the wool shortage. It is expected that some practical measures will be taken

Walter Farmer, Gilmanton, Wis., and his entry in baby beef contest.

to increase the immediate supply through the raising of more and better mutton. A program of great interest has been prepared and sheep and wool growers will be interested in attending the session.

The editor of the American Sheep Breeder, Mr. W. W. Birch, says there are a million less sheep in Wisconsin than in 1900, representing a decrease of about two-thirds. Considering the availability of northern Wisconsin cutover lands for raising sheep and the present prices of mutton and wool, it would seem that this condition should not exist. Here seems to be an opportunity to increase production without very much investment. Clearing is unnecessary in most cases for sheep. On the contrary, the sheep help to clear the land and they can do it very economically.

T. H. Campion, county food agent of La Crosse county, after a careful survey of the silos of the county, estimates that the total number is now 1,075, an increase of sixty-two in the past year. Some good work has been done by Mr. Campion, under the direction of the County Council of Defense, interesting farmers in more silos.

Mr. Guy Spiers, creamery operator at Eau Claire and Chippewa Falls, predicts that butter will be very costly during the coming winter. The quantity of butter in storage on July 1st had gone down to 7,000,000 pounds less than last year at the same time. Mr. Spiers recently returned from an inspection trip of several of his creameries in northern Wisconsin and says that he never saw things looking any better in that country. Upper Wisconsin will produce one of the biggest crops of potatoes and small grain in many years, Mr. Spiers believes.

A Burnett county farmer has lost fifteen shoats by poisoning with arsenate of lead, which was used for spraying in the orchard. It was thought possibly that the pigs were poisoned by part of the spray which settled on the grass under the trees. The case is regarded as unusual and, as a rule, there is no danger from spraying, but it appears that it is advisable not to be careless in the use of Paris green, arsenate of lead or any other poisons used to control plant insects or disease.

The Wisconsin Department of Agriculture has issued a warning against hog cholera as follows:

Hog cholera season is now here. The annual losses from this disease in the United States amounts up into the millions of head of swine.

Patriotic duty as well as personal gain demand that these losses be avoided.

The 1917 Wisconsin legislature appropriated $2,000 to the Wisconsin Department of Agriculture to be used in controlling outbreaks. The department will within the amount named endeavor to get in touch with all outbreaks and direct the attack in cooperation with hog owners, local veterinarians, county agents and the college of agriculture.

Notify the state veterinarian at Madison of all outbreaks.

If hog cholera appears in your neighborhood, have your hogs treated with serum. Serum may be obtained at cost from the college of agriculture. If you cannot administer the serum yourself, employ a veterinarian, and if no one in your locality is familiar with its administration, notify the state veterinarian and a deputy will be detailed to aid and instruct in its application.

Speed up and let someone assist you to save your hogs.

Let us save them and not burn them.

Eternal vigilance is the price of clean swine yards in our state. Pork is not only worth too much money to be thrown away by carelessness, but it is very necessary as a part of the food products of the nation.

County Food Agent D. H. Otis, in Waukesha county, has urged farmers who have good varieties of winter wheat to report same to him. He expects to list the seed on hand so that those without seed may get in touch with others that have it. Mr. Otis has been conducting a campaign against flies, urging the removal of their breeding places on farms throughout the county. In the hot summer season he insists that manure piles should be hauled to the field very frequently, and he has also recommended darkened stables and screens and the application of spray mixtures to afford temporary relief.

As a result of the state-wide silo campaign many experiment station workers are expecting that Wisconsin will have 75,000 silos by 1918. Wisconsin bankers are repeating their previous offers to loan money to farmers with which to erect silos. The fact is, however, that not a great many

Chas. Skaife, Livingston, Wis., and steer he is feeding in baby beef contest.

farmers need to borrow money to build silos. Most of them have the money or the credit. However, those who don't happen to have it handy and want to pay cash for the silo which is always the best and cheapest way, can easily secure the accommodation necessary at their bank.

Anticipating against a possible wet August and September, warning has been sent to potato growers to spray liberally with Bordeaux mixture to prevent late blight. Four sprayings are usually required to insure against blight. Experiment station workers are keeping a close lookout for the first appearance of blight.

The Hayward, Wisconsin, creamery recently closed its fifth year. Within a year this creamery has paid its patrons over $90,000 for 291,000 pounds of butter fat. T. W. Schuman, buttermaker, has won many honors for his good work in this creamery and the success of the creamery is due in a large measure to his untiring efforts.

The Belleville, Wisconsin, Breeders' Club and Modern Woodmen will hold a monster Dairy Day celebration, September 3d. Representatives of dairy appliances or equipment are invited to make a display on that date.

Answering the Nation's Call

IN this "supreme test" of the nation, private interests must be subordinated to the Government's need. This is as true of the telephone as of all other instrumentalities of service.

The draft for war service which has been made upon the Bell System is summarized in a recent Government report.

Government messages are given precedence over commercial messages by means of 12,000 specially drilled long distance operators all over the country.

The long distance telephone facilities out of Washington have been more than doubled.

Special connections have been established between all military headquarters, army posts, naval stations and mobilization camps throughout the United States.

More than 10,000 miles of special systems of communication have been installed for the exclusive use of Government departments.

Active assistance has been given the Government by the Bell System in providing telephone communications at approximately one hundred lighthouses and two hundred coast guard stations.

Communication has been provided for the National Guard at railroad points, bridges and water supply systems.

A comprehensive system of war communication will be ready at the call of the Chief Signal Officer, and extensive plans for co-operation with the Navy have been put into effect with brilliant success.

As the war continues, the demands of the Government will increase. And the public can help us to meet the extraordinary conditions by putting restraint on all unnecessary and extravagant use of the telephone.

Urging Better Seed.

To the Editor:—In the spring an association of business men in the county was formed to give financial assistance to worthy farmers who were unable to secure it elsewhere. This assistance was mainly for the purchase of seed. No assistance was given the farmers until I had personally visited the farm and determined his actual need. He was then given the seed and his note taken for payment due at the time of harvest. In this way a number of acres had been put into crops in this county that otherwise would not have been planted.

The labor problem has worked itself out in very good shape, although there are farmers who are now short of help. Yet the situation is not at all acute. Many of our farmers want help, but are unwilling to pay wages which are at all attractive.

We have conducted a silo campaign which has brought results. The campaign has not been at all spectacular, but has been able to connect farmers direct with their local silo agent and in this way a number of silos were constructed. Both the silo agents and manufacturers are very lenient regarding the time of payment for silos. The banks have also been willing to advance money for silo construction.

At the present time I am attempting to get in touch with as many farmers as possible that have pedigreed winter wheat or pedigreed rye and urging them to save as much of it as possible for seed this fall. I believe there will be a good demand for both seed rye and winter wheat this fall. If this demand can be filled from good pedigreed varieties the yield will be increased next year and thus the food supply be increased. Henry Lunz,
Emergency Food Agent.

Reports made to the Wisconsin Experiment Station indicate the presence of barley stripe, a fungous disease to some extent in certain localities. According to crop disease specialists, little can be done at this season of the year to control the pest or to reduce the losses caused by its ravages. "The disease," said A. G. Johnson, of the college of agriculture, "carries over on the seed from year to year and appears first on scattering plants when the crop is from six to eight inches tall. The affected plants show light colored or brownish stripes in the leaves. As the plants begin to fill those which are diseased crinkle down and die. Formaldehyde carefully applied controls the disease almost perfectly. It is applied shortly before seeding. After thorough cleaning, seed should be soaked for two hours in one pint of commercial formaldehyde mixed with thirty to forty gallons of water, then drained and spread out to dry. This treatment controls the covered smut of barley as well as stripe disease."

A Practical Seed Corn House.

Dane County Farm Owners Have Worked Out This Problem With a Very Satisfactory Result.

SEED corn houses, like all other buildings, must be planned correctly in order to serve best the purpose for which they are intended. The beginner in the seed corn business often finds that the house so carefully planned and apparently in every way perfect does not meet the requirements of practice. After a year or two the owner knows just exactly where the trouble lies and the next house that is put up will not have the mistakes found in the first one.

It took Kaltenberg & Sons, near Waunakee, six years in the seed corn business to discover the type of house which would give the best results. The farm is owned by Jacob Kaltenberg, Sr., and his four sons, Anton, Peter, Joseph and Jacob, Jr., and contains approximately 400 acres, of which about one-fourth is planted to corn each year. In 1906 Anton started for the agricultural college at Madison and the very same year, convinced of the possibility of raising seed corn, he brought home twenty ears of Silver King corn, which he carefully planted in separate rows. The following year, 1907, thirteen bushels were harvested and from the thirteen bushels the seed corn business grew until approximately 400 bushels are sold each year to neighbors and farmers throughout the state. Although 400 bushels might not seem so enormous an amount, it is all they can take care of and keep up the quality of the seed.

The first corn was stored in the attic where it was allowed to dry thoroughly with the aid of furnace heat. Later on a seed corn house was constructed 16x16 with a stove in the center and the corn on wire shelves two rows to the shelf. Somehow or other the corn did not dry satisfactorily with stove heat. There would always be some moldy cobs even with the corn that was nearest to the stove. Some of the ears would draw moisture from the other ears and nothing could overcome this difficulty. So the boys kept the house a little while longer until they were thoroughly convinced that stove heat and wire shelves were not quite the proper thing for a seed corn house. It might be for others, but, according to the boys, the results obtained convinced them that a better plan must be followed.

In 1913 they built their present seed corn house which has on top of an eight-foot cement basement a one-room structure 14x22x8 feet. Five windows and a door together with three ventilators on the roof admit the air and wind during the bright, sunny days of fall. Each window has a storm door which can be closed during the cold weather. In the basement a furnace from which six registers are supplied with heat is kept going constantly from October until December.

The corn is picked from the seed field, which is usually about twenty or thirty acres in size, during the first two weeks in October. Seed corn must be picked somewhat earlier than other corn. As only one-fourth of the field is good seed corn, the three-fourths which must be put into the crib, where no special means of drying are provided, is partly spoiled before being entirely fed up. This is a loss, however, the seed corn man must stand or else go to the expense of picking a field over twice. After the seed corn has been picked it is taken to the seed corn house and hung on a homemade hanger, which consists of an ordinary pine tobacco lath four feet in length and having on each side sixteen of the twenty-penny finishing nails. By means of a hook two laths can be combined and thus hung from rods attached to the rafters and running the length of the building. One man can, with a little practice, soon learn to hang ten bushels of corn an hour. The advantage of the lath hanger over the wire hanger is the rigid center which can stand the push of the ear as the butt is forced upon the nail. The hangers are about three inches apart on the rod and 400 bushels can thus be placed in this small space without much trouble.

For the first month the five windows and the door are kept open every day in order to allow plenty of circulation in the house. The fire is started the second week, however, and continued until the final day. After the first month the house is partly opened for two weeks—just

Heated, well-ventilated seed corn house on Kaltenberg farm, Dane county, Wisconsin.

enough to allow plenty of circulation at all times. On the nicer days all the windows are opened. From then on until the end of December the building is kept closed, but the heat coming from below and the ventilators on the roof provide plenty of circulation. When the corn becomes like glass so that about one-half of an ear will shell off when it is dropped on the floor the process is finished. It is then safe to send the corn by express or freight during the coldest weather without any injury to its germinating powers. When corn has not properly dried out cold weather will affect the vitality of the germ and a lower test results.

Raising seed corn is not as simple as it appears nor can quality seed be placed on the market without expense or trouble. This seed corn house is the result of many years of close observation and was erected at a cost of nearly $300. The drying out process costs in fuel better than $5 a week. The corn not fit for seed, but picked somewhat earlier constitutes a loss because it is of a lower quality for feeding purposes than corn picked later when it is mature. The extra work and the chances for poor germination which would make the corn valueless as seed must also be considered items of expense. All these things do not make the actual profit from $3 or $4 seed corn as large as many people suppose.

The best of the seed corn is used each year for planting the home field. The corn land which is to produce the seed is carefully chosen from pasture sod land which has good drainage and plenty of fertility. During the winter manure is added to this land to make the yield for the coming year as large as possible and give the corn every opportunity to develop properly. Between twenty and thirty acres are planted for seed purposes each year.

Responses to the appeal for householders to help the food supply by raising their own foodstuffs as far as possible have been particularly encouraging, the national emergency food garden commission announced recently. The increase in the number of food gardens for the whole United States is 222 per cent. This gain represents a total of 1,175,000 acres, according to the best figures obtainable. The commission estimates that the value of the food to be raised in home gardens this year will approximate $350,000,000. Much of this food will be raised on vacant lots and tracts not heretofore cultivated, making the increase all clear gain.

EAGLE

A Triumph in Kerosene Tractors

Two machines in one—perfect *traction power*, and *belt power* for all purposes.

The famous Eagle two-cylinder valve-in-head engine. Not assembled—*made*. The results of years' experience in farm motor and tractor making. Just right for medium sized farms. Easy to operate, reliable, economical. Three sizes; 8-16 H. P.; 12-22 H. P.; 16-30 H. P. Absolutely guaranteed. Write today for free booklet.

EAGLE MFG. CO.; 640 Winnebago St.; Appleton, Wis.

When writing to advertisers kindly mention The Wisconsin Farmer.

The Light Tractor With the Heavy Pull

ALL fields are alike to this tractor. It has pulled plows through heavy clay and worked soil where water stood several inches deep—it has demonstrated its ability under all conditions. A Waukesha tractor motor gives it abundant power for plowing, discing, harvesting, hauling large loads and handling heavy belt jobs. Yet this tractor is light enough for the small power jobs on the farm. The

TURNER Simplicity

tractor is adapted to farms of average size and is built for all-around farm work. Although light in weight it has great strength—can be relied on to deliver 2,000 pounds constant pull at the draw bar. Simple control—handled with a single gear-shift lever. All working parts run in a bath of oil and are enclosed in dust and dirt-proof cases. Standard design—only the most approved and tried-out principles are used. Equipped for kerosene or gasoline. As good in every way as the famous Simplicity farm engine, having thousands of satisfied users.

Tear out this ad, write your name and address on the margin and mail for descriptive literature. Mark a cross under the Simplicity Farm Engine and Feed Cutter if interested in these products.

TURNER MANUFACTURING CO.
106 LAKE STREET PORT WASHINGTON, WIS.

Simplicity Blower-Cutter noted for its great capacity and economy of operation. Many exclusive features which insure efficiency and durability.

New Simplicity kerosene engine. Throttling governor insures smooth running. Special carburetor provides perfect mixture. Burns kerosene without smoke or carbon.

Good Yield of Hay in Wisconsin.

Clover and Timothy Show Fine Quality—Small Grains Are Splendid—Corn Is Still Late.

WISCONSIN.

Adams County.—Clover and timothy hay are harvested and the yield averaged about two tons per acre. Oats are doing fine and if nothing happens there will be a good crop on the low lands. Rye is about ready to cut. Corn is growing rapidly. We will not have many apples this year. Gardens show fine condition. Early potatoes are in blossom. Young stock are healthy. Pastures furnish plenty of food on low land. Dairymen are not feeding heavily because of the high price of grain. —Louis Wollert.

Burnett County.—Haying is in full blast and the weather is ideal for it. The crop improved much during the last few weeks, and the yield will be about 75 per cent of that of last year. Grain is in excellent condition. We will have bumper crops of grain and potatoes if hot weather does not come just before the harvest. Corn is doing fine and there will be plenty of silage. Cattle show good condition and all farms are well stocked. The milk flow is falling off on account of flies. Pastures are good. Weather is very warm. —Fred Larson.

Chippewa County.—Grain is far enough along so that heat cannot injure it. Oats and barley look well. Some of the hard grain is now being cut. The hay crop was about half as good as last year. Corn is growing rapidly and will make good ensilage. Potatoes look well and if the blight and dry weather does not hurt them they will produce a good crop in this part of the state. Garden truck is fairly good and fruit looks fine. Live stock are doing fine.—Gustave E. Rheingans.

Clark County.—With favorable weather haying will soon be finished. The crop will be large with clover and timothy of fine quality. Grain looks well, but seems to be ripening too fast. Corn is catching up with the season. New potatoes are on the market. Fruit will not be abundant. Dairymen are depending mostly on pastures for stock feed.—Fred Ackerman.

Grant County.—Barley and winter wheat are harvested and oat cutting has begun. Oats will be of better quality than last year. The weather is very hot and corn and late potatoes need rain. Hay has been put up in fair shape and seems to be normal in yield. Pastures are getting dry. The heat has cut the milk flow considerably. Early potatoes are good, but there are only a few in the hill. Live stock show good condition.—P. R. Stoffel.

Kenosha County.—Haying is well along, but the crop is not as heavy as last year. The quality is good. Harvesting of rye and barley will begin this week. The crop is better than last year, although it lodged to some extent. Cabbage, beets and onions are in fine condition. Potatoes are good and some early potatoes are now being marketed at $2 a bushel. Frequent rains have kept feed growing well and cows are keeping up the milk flow. Gardens are producing well. The prospects are good for a second crop of alfalfa. Corn has grown very rapidly during the last week.—Geo. Kreuscher.

Kewaunee County.—Haying is about three-fourths done and the crop shows fair quality. Corn is three week late, but is growing nicely at present. Small grains show good promise and barley has commenced to ripen. Pastures are very short and there is quite a falling off in the flow of milk on account of hot weather. Potatoes look fine and garden truck promises well.—W. C. Katel.

Marinette County.—Meadows of last year's seeding made a heavy hay crop and most of it went into the barn in good condition. The old seeding did not yield so heavily. Some timothy is yet to be cut. Corn is growing nicely, but still remains late. Early potatoes are coming onto the market and the price is falling rapidly. Winter wheat looks fine and will be ready to cut in a few days as also will rye. Oats look well. The yield of this crop will be good if the weather does not get too warm before harvest. Pastures are drying up to some extent. Only a small per cent of the dairymen here feed grain to their cows. Gardens look fine. —W. B. Sanderson.

Monroe County.—Haying is nearly done. The yield is about one-third heavier than last year and of very good quality. Winter wheat which was cut here made about thirty bushels per acre. Spring wheat looks well. Early oats are being cut and may make fifty bushels per acre. Corn is growing rapidly and will make a good crop. Pastures are good because of frequent rains and cows are doing well. The creamery is getting more cream than last year. Gardens never looked better and potatoes promise a good yield.—D. F. J.

Oneida County.—The hoy crop will run about one and one-half tons to the acre. About half of it has been cut; the new seeding of clover was good, but the old meadows were poor. Grain looks well. Barley will be ready to cut by the last of the week. Hot winds and dry weather are damaging small grain in some parts of the county. Potatoes will make a big crop if rain comes soon. Corn is doing fine. Cattle are not doing well on account of dry pastures and flies. There are about 20 per cent more cattle than last year and fewer calves are being killed for veal. Garden truck is good.—A. Blumenstein.

Pierce County.—Rye and barley are being harvested and reports indicate a good yield of fair quality. Wheat and oats are ripening rapidly because of the hot southwest winds. Potatoes are doing well, but will need rain soon. Considerable clover was damaged in the first part of this season, but most of the crop was put up in good shape with a yield of about two tons per acre. Timothy was rather light and probably will not average more than one and one-half tons per acre. Corn is doing fine and will make a good yield if the warm weather continues. Pastures have been good and live stock are in fair condition.—T. B. Eaton.

Racine County.—Warm weather during the last two weeks has helped the corn very much. The hay crop is being harvested and the yield averages about two tons per acre. Dry weather favors harvesting. The grain harvest has not started. Oats and other grains show good condition and promise heavy yields. The fruit crop looks well, especially cherries and small fruits.—Chas. Jeffery.

Sauk County.—Hay has been put up and gave a good yield, much above the average for this section; in addition the quality was fine. On sandy land the yield ran about one and one-half tons per acre and on heavier soil about two and one-half tons. Rye is in the shock and from indications the yield fell below normal. A few small fields of wheat look well. Corn is growing rapidly, but will not mature without a very late fall. Potatoes are making a good growth and promise a good crop. —A. H. Buehler.

Trempealeau County.—Most of the winter wheat and rye are harvested, and some of the barley. Excessive heat and drouth damaged the oats and corn. Oats cannot be helped, but rain would do the corn and potatoes much good. In fact, rain must come soon in order to make even fair crops in this section. —C. J. K.

Washburn County.—Small grains look fine. Corn is growing nicely and has a fair stand. Potatoes are excellent. Hay and pastures are rather short.—J. W. McCulloch.

Walworth County.—Weather has favored growing crops during the last ten days, but there has been too much rain for haying. However, this work is nearly done and the hay crop was much better than we expected. Barley and rye are nearly ready to harvest. Grain crops are very promising, but will lodge badly if a storm comes. Early potatoes are good and late ones promise a good yield.—Arthur Ewing.

MINNESOTA.

Mower County.—Corn is doing nicely in this section, except on the low land where rain and cold weather have almost ruined it. Oats will make an average crop. Barley is good and some of it is being harvested. The hay crop made a splendid yield. Stock cattle are scarce. There are fewer horses raised here than formerly; automobiles have put the driving horse out of business. —Walter H. Martin.

Requests For Wisconsin Trained Men.

To the Editor:—During the year closing July 1, 1917, the dairy department of the University of Wisconsin has been asked to recommend men to fill the following positions:

Buttermakers, 183; helpers in creamery, 24; buttermakers and ice cream men, 14; cheesemakers, 176; helpers in cheese factory, 4; combined butter and cheesemakers, 16; managers of factories, 16; ice cream makers, 12; cow-testing association men, 4; city milk plants, 27; city milk inspectors, 6; condensed milk factories, 35; factories wanted to buy and for sale, 23; dairymen, 8; traveling men, 3; oleomargarine factories, 7; instructors in other colleges, 25. Total, 583.

The manufacturers of dairy products are realizing more than ever before the greater value of trained men over untrained men because they are beginning to understand the importance of the small leaks and losses from waste that trained men will notice, but careless operators will allow to go to waste. Thus a saving of 25 cents per day on fuel, 10 cents on oil, 10 cents on salt, 5 cents on color and $1 on the waste of butter fat in the handling of milk at the cheese factories and cream at creameries may amount to $500 or $1,000 a year in a single factory.

It is estimated that there are at least 3,000 creameries, cheese factories, milk plants and ice cream factories in Wisconsin. If the operators, managers and patrons of each one of these can be shown the saving through many small economies, the result will be a great increase in the total food and fuel supply of the country.

The following points should be given special attention in all of our factories at the earliest possible moment:

Methods of Saving Fuel at the Factory.—Coal probably will cost from $8 to $10 a ton within a short time, and since losses amounting to $1 per day may easily occur in firing the factory boiler, it is important that this question should be given serious consideration.

Prevention of Mold in Butter.—Moldy butter was the cause of considerable losses in Wisconsin butter last year. This trouble will, no doubt, arise again, but it may be easily prevented when the simple method of steaming both the tubs and the liners is thoroughly understood and practiced.

The Value of Skim Milk.—Farmers should realize that skim milk is worth 75 to 80 cents per hundred pounds for feeding stock at the present time instead of 30 cents per hundred as has been estimated in years past.

The Control of Moisture in Butter and in Cheese.—A factory cannot afford to be careless on this point, especially when the present high prices of these products prevail, as a uniform moisture content in both the butter and the cheese each day will materially affect the gross amount manufactured at each factory.

Some of the points to be noticed in connection with this campaign of saving food and fuel are the following:

1. The losses of butter fat in buttermilk, skim milk and whey.
2. Actual yield obtained of the product manufactured.
3. Is the yield up to the legal standard?
4. Are unnecessary overweights given in packages?
5. Is a record kept of actual weights of products sold in each shipment?
6. Is there an opportunity for saving of fuel by covering steam pipes?
7. What is the condition of the boiler?
8. Are there any leaks in steam pipes?
9. What is the accuracy of the thermometers used?
10. Is the milk and cream thoroughly mixed before sampling.
11. Is the equipment for testing the moisture content of butter and cheese made each day, up to the highest standard desired?
12. Are the rinsings of the milk and cream cans saved each day?
13. Do you understand the feeding value of skim milk, buttermilk, and whey for feeding farm pigs, calves and chickens?
14. Is the food value of milk, cottage cheese, butter and other dairy products understood by both the producer and the consumer?

This saving of waste and reducing losses in the manufacture of dairy products will be one of the special features of the next winter dairy course, which begins at Madison November 6th. E. H. Farrington.

In Chippewa County.

To the Editor:—All crops in this portion of the state were looking fine up to August 1st with the exception of corn. Corn was very poor in most cases with, however, some very good fields in the lighter soils. The farm help question is indeed a serious one. There are some farmers who feel that they might as well let the crop spoil as pay $3 a day and board. I have seen more women and children in the hay fields this last week than I ever expected to see or thought would be necessary, and the weather was terribly hot, too. I do not see how the women could stand it. I am afraid that some of the women will look like the women in the story by Edna Ferber, "Fanny Herself," in the American Magazine, which your editor objected to so strongly as not being typical of the American farm women. Well, I know Wisconsin pretty well and too many of her women will stand up under the description of Edna Ferber and I am sure that I do not know any remedy for it. We are on the watch here for blackleg and hog cholera. We are also urging farmers to sow Wisconsin pedigreed rye this fall, as it will produce from five to ten bushels per acre more than the ordinary rye. The farmers near Bloomer, where the condensery is just starting, are trying to figure out the value of skim milk. There should be some experiments tried out right around here to find out what it is really worth to feed pigs. I have held a good many meetings in schoolhouses, with good audiences, preaching the gospel of good citizenship, better business methods for the farm, more sunshine in the heart and music in the soul, and I hope it is worth while. W. C. Bradley.
Chippewa County Food Agent.

Successful Crops

You may be certain of big profitable crops if you adopt the most up-to-date method of seed grain treatment as recommended by the U. S. Dept. of Agriculture—

FORMALDEHYDE
The Farmer's Friend

This powerful disinfectant destroys grain smuts, rust and fungus growth. It prevents flax wilt, also scab and black-leg diseases of potatoes. It rids stables and chicken houses of disease germs and flies. Formaldehyde is surely a great boon to the farmer. Our Formaldehyde at your dealer, 35 cents in pint bottles will treat 40 bushels of seed. Big illustrated Hand Book sent on request—free.

Perth Amboy Chemical Works
100 William Street New York

GET EVERY SPUD

This year, of all years, it is important to get all of your crop out of the ground. Every potato you harvest means money to you. Every potato available will be needed for food consumption. You are sure to get all of your crop if you use the

Hoover Potato Digger

Built in a variety of styles.

Besides getting all of the potatoes the Hoover digs your crop at less cost. Indications point to a big shortage of farm labor this fall. A Hoover Digger is crop insurance. It enables you to dig your crop in the shortest possible time. Digs as fast as any ten men. Delivers all of the potatoes in rows—every one exposed. The Hoover can be furnished with picker attachment. Potatoes can be delivered in crates or dumped in piles.

Hoover Diggers are built to last—built almost entirely of steel and malleable castings. The sides of the elevator made of structural steel. Elevator rods are offset. Potatoes do not roll back. This construction promotes separation. Dust-proof roller bearings are used in all important bearing points. Write for booklet covering the full line of Hoover Potato Diggers. Ask for package P—64

JOHN DEERE
MOLINE, ILL.

CURRENT EVENTS.

THE fourth year of the war opened last week with authorities differing as to which side has the advantage. One goes so far as to say that Germany would gladly have traded all her colonial possessions (all the territory she has lost so far) any time for Belgium, and that she not only has practically all of Belgium today, but a good slice of France, Servia and Roumania and a lot of territory in Russia. No fighting has yet occurred on German soil, so that Germany has not yet been forced back to her own frontier to assume the defensive. On the other hand, the losses of men and guns are said to be heavier with the Germans than with the allies, so that Germany's man power is slowly but surely suffering. The Germans still have sufficient men, however, to enable them to rush forces from one part of the battle line to another to strengthen their defenses whenever the allies open up a new campaign. Authorities also differ as to how much longer the war will last. There are none who predict that it will come to a close before the fall of 1918, while many assert that it will run at least three years more. When the war broke out, in August, 1914, Lord Kitchener predicted that it would last three years and there were many who derided his predictions. Time has vindicated him, however. Peace talk is heard every little while, largely emanating from Germany, but it almost always follows some temporary victory for the Germans and comes at a time when peace, if made, would be in their favor. The allies have shown no intention of making peace until the German military power has been broken, and this seems almost as far off today as it did one, two or even three years ago.

THE French and English troops began a new drive against the Germans last week and met with considerable success. The first trenches, for several miles, were wrested from the crown prince of Bavaria after one of the most terrific artillery bombardments of the entire war. The German troops were sadly demoralized by the unending hail of missiles and were captured by many thousands together with numerous guns. When the news of the drive reached Washington, the authorities there were greatly encouraged. The possibilities of the new offensive produced the suggestion that if the allied front could be extended to the Dutch frontier, the Netherlands government might join the allies. Recent reports from neutral sources indicated that the Germans feared some such action by their little neighbor. In that connection, it has been noted that numerous small German steamers lying in Dutch waters since the outbreak of the war have been captured or destroyed recently while attempting to return to Germany, and that several divisions of German troops have been reported massed along the Dutch frontier. Holland has maintained strict neutrality thus far, but if it could be enlisted on the side of the allies the advantage would be a tremendous one.

A DELUGE of personal inquiries concerning future steps in the army draft, and of pleas from industrial concerns for exemption of their expert workers, drew from the provost marshal's office at Washington a statement that questions must be addressed to local boards and that claims for industrial and agricultural exemption must go later to the district boards. No general class of workmen will be exempted, Provost Marshal General Crowder told the coal production committee, which sought information whether miners would be left at their work. Appeals to the provost marshal's office from employers on behalf of their workmen can accomplish nothing, it was explained, as regulations promulgated by President Wilson govern all exemptions. "The question of whether a man is more useful to his country in a peaceful pursuit than in military service is a matter to be taken up with the district board," said an announcement, "and for that board to determine in the light of the circumstances surrounding each individual case. Procedure in case of claim for discharge on the ground of industry or agriculture is explicitly outlined in the regulations. Only the upper or district board has jurisdiction of an industrial claim for discharge."

THE enormity and variety of tasks confronting American army engineers in making the expeditionary force in France a single organic unit, independent of French and British aid, were emphasized by the officers of the chief of army engineers in a statement last week. Not only must miles of railroads with their narrow-gauge spurs be built, and bridges, roads, wharves and piers constructed and repaired continually, but lumber for a score of purposes must be cut from the forests of France by a regiment of trained foresters; great underground electric power houses must be established to supply current to the trenches and dugouts; scores of wells must be drilled and miles of water pipes laid through American camp cities somewhere in France. Sign painters and artists will have to be taught the craft of "camouflage" to conceal military operations from the enemy; expert miners will direct vast underground burrowing; battle maps of enemy territory must be made and a multitude of hospitals, refrigerating plants and machine shops are to be constructed.

IN a vigorous speech carrying with it an appeal to arms, for all able to bear arms, against German autocracy, Theodore Roosevelt declared America is only half awake to its task. He assailed the theory that the war can be financed by a tremendous tax on incomes and declared for heavy and progressive taxes on excess profits. "A reasonable profit should be given on government war contracts," he said, "but no man in America has a right to become tremendously wealthy as a result of this war. We are in a war and our first business is to fight," said Mr. Roosevelt. "Only a few months ago I heard people say they would give money, potatoes and other things, but would let someone else fight for them. That is pawnbroker patriotism. The foremost place in patriotism is that of the American who actually goes to face shells and cannon." In another brief address Mr. Roosevelt said all his kin who were eligible had "lined up" for military service and that "it isn't my fault that I'm not over there now."

REPORTS of the first selection boards to fill their army quotas for the selective draft will give the first definite information on probable percentage of rejections for physical reasons or on account of dependents. All available statistics indicate a probable rejection of one in every four for physical disability. The average for the whole country is expected to be between 25 and 30 per cent. There is no available data as to the dependents or industrial exemptions. Some officials expect the lowest rejection and exemption rates will be in well-to-do communities, such as suburbs of large cities, where men of comfortable incomes make their homes, and their sons have had better food, care and surroundings than factory hands of near-by towns and should be in better physical condition. In factory towns, the rejection rate for physical disability probably will be high, as the men are confined six days a week at their machines. Virtually every married man of those registered in these places is the sole support of his wife and children and such men cannot be taken.

AMERICA will win the war, Herbert Hoover, food administrator, declared in a statement, because of its superior resources and through the ability of the American people to organize. The success already evident of the nation's voluntary food conservation effort, Mr. Hoover said, points to a final victory. "Germany accomplished less in this direction in twelve months," he said, "than our people have in four. The only need of legislation and authority is to curb those who would profit by this voluntary movement." More than 2,000,000 women, Mr. Hoover announced, have enrolled as members of the food administration and pledged themselves to follow its directions as to saving food within the household. Within sixty days, he added, many more millions will have become members. "No one can rightly be gloomy over the outcome for the American people in this war," Mr. Hoover said. "Success in this war is a question of resources and the will and ability of the people to organize themselves to use them rightly and to endure."

THE senate of the United States last week passed a resolution providing for the submission to the states of a prohibition amendment to the federal constitution. The vote was sixty-five to twenty, eight more than the necessary two-thirds. The resolution now goes to the lower house of congress for action there. It reads as follows: "The manufacture, sale or transportation of intoxicating liquors within, the importation thereof, into, or the exportation thereof from, the United States and all territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited. This article shall be inoperative unless it shall have been ratified as an amendment to the constitution by the legislatures of the several states, as provided in the constitution, within six years from the date of the submission thereof to the states by the congress. The congress shall have power to enforce this article by appropriate legislation." Twelve democrats and eight republicans voted against the measure; Lewis, of Illinois, and Reed, of Missouri, being the grain belt's representatives who voted in the negative. The matter was rushed through so as not to interfere with other legislation and in an endeavor to transfer the fight to the various states rather than to make it a national one.

AT the beginning of the fourth year of the war, last week, the German kaiser issued a proclamation in which he declared the victories of the past three years would be continued and that the enemy could not prevail against the strength of the German arms and the righteousness of their cause. Among other things the "war lord" said: "The enemy is stretching out his hands toward German territory, but he shall never have it. New nations continue to enter into the war against us, but that does not frighten us. We know our strength and we are determined to make use of it. They wish to see us weak and powerless at their feet, but they shall not prevail. They received disdainfully our words of peace; they did not know how Germany could fight. Throughout the world they have slandered the German name, but they cannot extinguish the glory of German deeds. Thus we stand erect at the close of this year, unmovable, victorious and intrepid. Our trials may still await us, but we shall meet them with a grave mien and full of faith. Throughout the three years' achievement the mighty German people has become firm in its resistance against all that the power of the enemy can conceive. If the enemy wishes to prolong the sufferings of war they will weigh more heavily upon him than upon us." The allies refuse to take the German hints at peace as serious or as being made in good faith. They are a unit opposing any peace which does not provide for the complete restoration of Belgium, which Germany has not as yet conceded in any manner whatever.

Fits Your Farm

Does All Farm Work Without Horses

See for yourself how well the Moline Universal Two-Wheel Tractor FITS YOUR FARM. It *cultivates* as well as plows. It works on plowed ground without packing the soil. It is as easy to handle as a team of horses. It gets close into the fence corners, turns short and backs with tools attached. It is a real one-man tractor. You ride on the tool where you can see the work you are doing. You don't have to have someone run the tractor while you operate the farm implement, and finally, it DOES ALL FARM WORK WITHOUT HORSES.

Costs Less Than 4 Horses Does the Work of 7 Horses

With all the advantages named above the Moline Universal Two-Wheel Tractor is also low in first cost and very inexpensive to operate. It costs you less than 4 good horses. When it comes to pulling it has the power of 5 horses and because it travels faster and never tires, it will actually do the work of 7 horses.

MOLINE ORIGINAL 2 WHEEL TRACTOR UNIVERSAL TRACTOR

CULTIVATING

DRILLING

HARVESTING

will do anything you can do with horses and do it quicker, easier, better and with less hired help. Because all its weight is on two wheels — it has no dead weight to carry. All its weight is traction weight. It throws all of its weight into the pull. The tool you hitch it to forms the rear wheels. This gives two big advantages. FIRST: It does away with almost a ton of needless weight—which tractors of the 3 and 4 wheel types require. SECOND: It enables the operator to ride the tool instead of the Tractor. In this way you can watch the work closely. You can turn short, get closer into fence corners than you can with a team and back with tools attached.

If you have an average farm of from 80 to 300 acres you will find this one-man, two-wheel, all-purpose tractor ideally fitted for your work. Don't buy any tractor until you have investigated the Moline Universal. Write for new Catalog Folder and read how this tractor is solving the hired help and power problems on other farms like yours. Write today.

DAIRY

Selling Out to the Butcher.

It has been reported that scarcity of feed and high prices of beef are causing many farmers to dispose of their dairy cows. The extent to which this is being done cannot easily be determined at this time, but if the sale of dairy cows reaches such proportions as to deplete the herds in the country, a shortage of dairy products will follow that can only mean a calamity to the nation. The importance of milk and milk products for food has been emphasized until their use has reached an extent where they are practically indispensable. In many homes butter and cheese have largely displaced meat. With meat soaring toward a price that is prohibitive for many persons, a sharp decline in the supply of butter and cheese would produce a shortage in fat and protein foods, because these substances in a readily digestible form compose only a small part of a vegetable diet. The result would be undernourishment for a large part of the population.

The present reports, however, need not give alarm. Successful dairymen hold the opinion that low-producing and unprofitable cows should go to the block, and the conditions now prevalent may be an economic force to compel this practice. If this is the case, then good instead of harm will result, because the dairy herds will thereby be improved in efficiency. Too many low-producing cows have been hiding in the herd among the high producers. High feed prices may force the use of the scales and milk test to hunt out these loafers and send them to the butcher, the price of beef furnishing a stimulus for such work. Under such conditions may good come even out of high prices.

In so far as the marketing is confined to inferior stock, we may look upon the situation with favor. A relatively small herd of high-producing cows renders a much greater service in times of food shortage than a large herd of low-producing cows. Feed is used more economically and the status of the dairy industry improved. But a note of caution may be sounded with regard to marketing young stock. The same conditions which induce selling of low-producing animals may induce marketing of calves and heifers. When feed prices reach a high level, many farmers and dairymen look with disfavor upon calf raising, preferring to sell them for veal and risk the chance of buying good cows when they are needed. Experience teaches that the scarcity of good cows is a stumbling block to such practice. Good milkers are not available at anything like satisfactory prices. The surest way to build up the dairy herd lies in filling the vacant ranks with heifers raised on the farm.

Even though feed costs rule high, wherever possible the good calves and heifers from high-producing parents should be saved. They will be needed to fill the places of culls and old cows that have served their period of usefulness. If they are not saved the dairyman may come to a time when he will look in vain for profitable cows to replenish his herd. As long as the scrub stock goes to market at the lure of sky-high prices for beef, there should be no real concern, but whenever the number of good young stock falls short, the dairy industry faces a perilous situation. Let the dairyman think before he sends his promising calves and heifers to market this year; for all indications point to the fact that good dairy stock will be in great demand.

A SILO OF GOOD STANDING WHICH WILL ALSO STAND SECURE FOR A GOOD LONG TIME.

The Dairyman's Profit.

To the Editor:—Every time we hear those who buy butter speak of it, we catch some such note of complaint as this: "The farmers must be just piling up money! Such a price as that for a pound of butter!" The same note may be heard in regard to the price of milk. People think the farmer is profiting greatly by the price he receives for this household necessity. We hear it in regard to eggs, potatoes, everything the farmer has to sell.

What these good people do not know is the cost of producing milk and butter and what share of the price they have to pay really ever reaches the farmer at all. All through the winter months, as well as when the pastures are short in the fall and early spring, cows must be fed liberally of grain. If those who do not understand why dairy products are so high would just take their morning paper and see what wheat feed, bran, middlings, gluten—every kind of mill stuff, in fact, is quoted at, and then remember that this is just what the farmer is feeding to get his milk, and then if they were to trace the price of milk back to the farm and find out exactly what the farmer gets for it, these friends might change their minds in regard to the farmer piling up money so fast.

Then, too, there is this side of it: No man who keeps anything of a dairy can do all the work himself. He must have help. This help must have better pay than hired men received in the past. It is all right that they should. Their own expenses are much higher than they used to be; but it makes the farmer squirm to meet the increased demand for better wages. As a rule, the farmer keeps all this to himself. He does not like to confess to his hired men and to the world what is really his financial condition. Only by chance does this come out.

In our part of the country just now there is a fund from which farmers may borrow to meet the expenses of buying seeds and other farm necessities, giving their personal recognizance therefor. There is a committee in charge of the disbursing of this fund, and the chairman of our local committee told me only yesterday that he was surprised to see some men apply for this kind of aid. He had supposed they were in comfortable circumstances, not at all affected by the stress of the times; and here they were, borrowing money to meet current farm needs.

To my mind all this goes to show that the price of milk will have to go still higher, butter will have to bring a better price or the farmer will have to stop doing business. The only other alternative is that some way shall be found to curb the tendency of the distributing agencies to get the lowest possible figures for milk from the farmer and the highest possible price from the consumers. Somehow the cost of getting milk from the farm to the home must be lowered. Then farmers will receive more for their product and the consumer will get his milk and butter more cheaply.

Subscriber.

The National Dairy Show.

The men of the industry are responding with such enthusiastic interest to help make the National a success this year that the mark we are now shooting at is a 100 per cent better show than last year. The patriotic fervor which every man evidences when approached to take hold with both hands this year and help solve the problems before the dairy industry, which are many and complex, bespeaks an extremely valuable show and mass meeting of the industry this year at Columbus, Ohio.

We hope all fairs and shows of the year, conducted to deliver wise and patriotic counsel upon the actual agricultural requirements of the day and desirous of rendering inspirational assistance, will be well attended, but for those of the dairy industry who recognize their obligation to humanity and desire to make their business profitable, the National will hold more sound fundamental value than all other shows combined. Held as it is in the center of a great live stock breeding and agricultural section, easily reached from everywhere, no limit to hotel accommodations, more cattle, more demonstration, more exhibits, more entertainment than ever before, with reduced rates on which you should secure early advice, granted from practically all sections—all insures the most valuable National Show ever held. A nice time of the year to get off for a needed rest and stock taking period, October 18th-27th. Make of this date your one certain, sure engagement of the fall.

The Auto Utilizer

and Your Auto Always Ready to Fill Your SILO

The Easiest Thing a Car Was Ever Set to Do

If you own an auto you don't need any other engine—nor do you need to wait turns for the regular silo filling workers to come around. Every farmer can do his own silo filling with his auto and an AUTO UTILIZER. Everybody's going to be mighty busy this year looking out for himself. Silo filling is going to be speeded up as never before. Here's how you can fill yours—independently, quickly, economically.

Just Run Car Onto Runway
No Jacking Up—Nothing to Attach

Car stands level and runs exactly as it does on the road. Positively no strain on its construction or working parts. Because the Auto Utilizer is so simple and everlastingly strong it's the only practical means of using a car for farm power. Unit construction makes it easy to move about. All steel and iron. Only two simple revolving parts—running in long Hyatt Roller Bearings. Find out all about it and you won't be without it. Ask your dealer if he has seen it—if he is going to demonstrate it. Send today for complete descriptive literature.

THE AUTO UTILIZER CO.
Dept. W. F.
Burlington, Wisconsin

The President Says:

"It is of the most imperative importance that everything possible be done and done immediately to make sure of large harvests."

Conserve and Increase Your Forage Crops

Turn under part of your pasture and plant it to saleable crops. Feed your stock this winter cheaper, easier and more profitably with a few acres of corn cut into ensilage with a Kalamazoo Ensilage Cutter and stored in a Kalamazoo Silo. Stop wasting land that should be used for money crops. This year, you have a chance to make *big profits.*

Kalamazoo
LIFE-TIME-SILOS

are built to meet the exacting farmer's needs. Best in design, material and workmanship. Have every desirable feature a silo should have and embody the "know how" acquired through more than twenty years experience in silo building.

Wood Stave Silos—Your choice of four of the best time-defying woods. Kalamazoo Silos are manufactured complete ready to set up. Quickly and easily erected by inexperienced home labor. All Kalamazoo silos are made with Galvanized Steel Door Frames and continuous doors, forming a safe ladder entire height of silo.

Write today for our free descriptive booklet. If interested in an Ensilage Cutter, ask for Kalamazoo Cutter catalog. *Easy payments,* if you wish.

KALAMAZOO TANK & SILO CO., Dept. 211 Kalamazoo, Mich.

Use A Wood Tire Hollow Wall Silo

Cannot Sag, Blow Down or Rot.

Cures and preserves silage perfectly. Prevents freezing of silage. Easy to construct. A real farm building, permanent and rigid. No hoops to get loose. No guy wires. No staves to shrink or swell, but a smooth, double wall from base to roof, the inner wall being of *California Redwood.*

Guaranteed for 20 Years

"But Lasts a Lifetime" WOOD TIRE—

The patented wood "tire" is built up of AIR SPACE— INNER WALL— OUTER WALL— inch boards, and shipped in sections. The boards overlap in step formation at both ends. When nailed together, these sections form a ring of unusual strength. The silo frame forms its own scaffolding.

Send for our folder which shows how the Wood Tire Silos built, and also what owners think of them. A postal brings it. Write today.

Agents Wanted in unassigned territory.

Cow-Testing Reports.

Monticello Association.

To the Editor:—In June we had 675 cows under test and 136 of these produced forty pounds of butter fat; of this number, sixty-three produced forty-five pounds and over. There was a slight falling off in the "honor" gains, due to flooding of a few pastures and disagreeable weather.

Fred Marty's registered Holstein, five years old, gave 2,415 pounds of milk and 89.7 pounds of butter fat in June. This is the record of our association. It is interesting to note that the bull calf from Cornelia Johanna sold for $100 shortly after it was four weeks old. Mr. Marty tells us that before Cornelia Johanna was tested, he would have sold the calf for $75 and probably less.

The best grade cow in our association last month was owned by A. Kubly; she produced 1,824 pounds of milk and 63.8 pounds of butter fat.

As usual, Baltz Hoesly ran away with the herd honors as his twenty-eight head averaged 1,425 pounds of milk and 46.9 pounds butter fat. These cows were fed on pasture alone. Mr. Hoesley in our list this month has sixteen cows producing over forty-five pounds. Enclosed is our list of forty-five-pound cows for the month ending July 13th:

Owner, name and breed	Age	When fresh	Lbs. milk	Per cent of fat	Lbs. B. fat

Black Earth Association.

To the Editor:—For the month ending July 19th, we had sixteen forty-pound cows, and six over forty-five pounds. The milk flow is down considerably, owing to the hot weather and flies. Fred Stubley's herd of twenty pure-bred Jerseys are the herd holding the highest record, producing an average of 33.9 pounds of butter fat per cow. Following is the forty-five-pound list:

Owner, name and breed	Age	When fresh	Lbs. milk	Per cent of fat	Lbs. B. fat
B. W. Stuart					
Spot No. 1, G. Hol.	10	3-17	1080	4.2	45.4

Wood County Report.

To the Editor:—Enclosed is our list of forty-five-pound cows for July. We had 623 cows under test and sixty-two made forty pounds of butter fat in thirty days. Our high cow was 81.4 pounds, and made the third highest record this association has ever had. One herd averaged 36.59 pounds and another 35.92. These herds belonged to W. A. Schultz, of Auburndale, and Mr. A. Osenga.

Owner, name and breed	Age	When fresh	Lbs. milk	Per cent of fat	Lbs. B. fat

J. L. WILLIAMS, Official Tester.

Alban and New Hope Association.

To the Editor:—The dairy float, shown in picture reproduced herewith was a distinctive feature in the Fourth of July parade held at Rosholt, Portage county. This float exhibited a silo, an up-to-date stall and manger provided by a local hardware company and a grade Guernsey cow owned by C. E. Erickson. This cow produced 467 pounds of butter fat in the year 1916, being third in production of all the cows under test in the Alban and New Hope Cow-Testing Association for that year. During the procession Mr. Erickson milked the cow, Mr. Worsted, secretary of the association, did the feeding, and Mr. M. E. Smith, official tester, did the testing of milk. J. M. Coyner, our county agent, weighed the milk and Mr. Ole P. Dobbe, recorded the weight of the milk on milk sheet. Mr. Warner, buttermaker at Rosholt, was in charge of the separator. Spectators who watched this float in the parade could not understand how they could get three pails of milk from one cow. This mystery was later solved when it was told that a milky appearing solution of lime water was used to fill the pails. P. H. Bremmer, of the Wisconsin Lumber Co., built the miniature silo and furnished the lumber for the same. Mr. Bremmer is a firm believer in coöperating with the farmers. The silo campaign which has just closed in our county resulted in promise of twenty new silos.

M. E. Smith, Official Tester.

CAMPAIGNING FOR COW-TESTING ASSOCIATION MEMBERS AND MORE SILOS IN PORTAGE COUNTY.

Sheboygan County.

To the Editor:—Mr. J. Bloomer owns the highest producing cow for the month of June; she produced 1,543 pounds of milk which tested forty-two and contained 68.6 pounds butter fat. Her record for May was 1,535 pounds of milk, test 3.8, butter fat 58.3.

Mr. Will Lohnis' herd of grade Holsteins holds the honors as the highest producing herd in the association for the month of June. His herd of eight cows averaged 1,452 pounds milk, average test 3.5, average pounds butter fat 48.7. These cows consumed an average of five pounds of grain daily, besides their pasture.

Mr. Will Nyhof owns the cow which produced the largest flow of milk for the month of June; her record is as follows: Milk, 2,280 pounds; test, 2.7; butter fat, 61.6 pounds.

Mrs. Thomas Bichler has decided to improve her future herd by using a pure-bred sire. She purchased a pure-bred Holstein bull of S. L. DeSchmidt. This animal is backed by a good seven-

(Concluded on page 16.)

Get All the Cream

YOU cannot expect to get all the profit from your cows unless you have a separator that skims clean. Why don't you make up your mind here and now to buy a **Primrose** or **Lily cream separator?** Then if your checks are not big enough, you will know that the trouble is with the cows, not with the separator.

The president of the Iowa Federation of Cow Testing Associations says that of the machines in use in his association, and they are many, the **Primrose** skims closest. It leaves less than one-hundredth of one per cent of the cream in the milk. The **Lily** skims just as close. Neither one wastes any cream. With prices of everything as high as they are now, to waste cream is little short of a crime.

Yes, you can buy separators for less money. You can also pay more. But you cannot buy a closer skimming machine, one that runs easier, or one that will skim clean for a longer time. Do not delay. The longer you put off buying a **Primrose** or **Lily** cream separator, the more you lose. Get one of these machines, and your separator troubles will disappear as if by magic. Drop us a card for catalogues and full information.

MEAD CYCLE CO., DEPT. D184, CHICAGO

APPLETON Silo Filler

It costs you less because

its *price* is no higher and its cost in service is much *lower. Records* prove this.

Guaranteed to do more and better work with less power

and labor than any other. Tremendously strong construction; frame solid oak and steel, mortised, bolted, braced: impossible to pull out of line. Blower independent of cutter; allows speed adjustment for minimum use of power for any height silo.

Feed table frictionless, runs on chilled iron rollers; knives spiraled, giving clean shearing cut with least use of power. (10 lengths of cut—5/16 to 2¼ inches.) Easiest to handle and safest—feed rolls and table controlled by one lever; automatic safety device; low down, cut-under frame.

Two books FREE!

One on silo building and silage crops etc; the other a catalog of Appleton Silo Fillers; showing four sizes for 4 h. p. engines and up. Write

Appleton Mfg. Co., 4122 Fargo Street, Batavia, Illinois

Origin of the Red Cross.

Active interest in Red Cross work is spreading, and many are working during their spare time in different branches of relief work. The work of the American Red Cross at the present time is so far-reaching that it is interesting to note from what a small beginning the movement sprang.

One day in midsummer in the year 1859 a terrible battle was fought at Solferino in the northern part of Italy between the Austrian army and a combined force of France and Sardinia. It was a fierce struggle, in which the Austrians were defeated. When it was over, 35,000 men lay on the battle field, dead or wounded, and only a handful of doctors and surgeons were present to care for them. As a result, many of those who might have been saved by prompt and proper care lay for days where they had fallen.

A Swiss gentleman named Henri Dunant, who viewed the field after the battle, was greatly stirred at the sight. He rendered what assistance he could to care for the wounded, and when he reached home he set about organizing a world's society for wounded soldiers. He wrote a story of the field of Solferino, gave lectures, and addressed communications to all the nations of the world inviting them to join in such an organization.

A conference at Geneva was the result of his efforts. Eleven nations joined in the plan. The symbol of the society, a red cross on a white ground, was adopted as a compliment to the Swiss government, whose flag is a white cross on a red ground, and it was agreed by the representatives of the eleven nations that this emblem should be a protection to all members of the society, its helpers, hospitals and the sick and wounded under its care.

The United States did not pledge itself to become a member of the society until the year 1882. Clara Barton, the civil war nurse, was responsible for this action. Miss Barton at the beginning of the civil war was a clerk in the patent office at Washington. Immediately upon reading President Lincoln's proclamation calling for 75,000 volunteers she gave up her position and volunteered as a nurse without pay in the Army of the Potomac.

Miss Barton and her helpers worked on the battle fields even during the firing, and so faithfully and fearlessly did she work that toward the end of the war she was appointed to have charge of all the hospitals at the front, and later, in appreciation of her unusual ability, President Lincoln appointed her to conduct a search for missing men. So well did she perform this task that she was able to report the names and fate of more than 30,000 missing men of the Union armies.

However, a year or two later she was obliged to give up the work on account of ill health, and she went to Switzerland to rest. It was there that she became acquainted with the work of the Red Cross. So interested was she that at the beginning of the Franco-Prussian war in 1870 she immediately volunteered her services with the Red Cross. This experience so impressed her with the value of such a society that upon her return to the United States she began founding a similar organization. The society Miss Barton founded, however, did not devote itself exclusively to relieving wounded soldiers, but to the relief of all suffering in times of famine, pestilence, floods, fires, earthquakes or any great misfortune. This work is familiar to all.

The American Red Cross was reorganized in 1893 under the name American National Red Cross. The society was incorporated by an act of congress in 1900 and placed under government supervision. The management of the society is conducted by a central committee of eighteen members. Six of these are appointed by the president, who also is president of the society. One of the things required of the society is that at the beginning of each year a full account of the past year's work be given to the war department.

In 1905 the total membership of the American National Red Cross was 300; today it numbers thousands. From the small beginning made by Clara Barton has grown a society that knows no boundaries of nations, a society that carries relief and hope and cheer to every corner of the world where suffering and need exist.

One Way to Use Waste Skim Milk.

One of the readers of the Home page, Mrs. J. C. P., writes us as follows:

I have read so many helpful things in your columns that I am coming to you for aid myself. I have to throw out a great deal of milk and I want to know how I can use it, for I do not like to waste it. Is there not some kind of cheese I can make from sour milk?

There certainly is a cheese that can be made from sour milk, and it is a most delicious and nourishing food. Cottage cheese, as it is called, is richer in protein than most meats, and is much cheaper. Every pound of it contains more than three ounces of protein, which is the chief material for body building, besides being a valuable source of energy. That being the case, it would be almost a crime to throw away skim milk or sour milk, and particularly during these war times when women are being urged to save every ounce of food possible. The more cottage cheese that can be used to replace meat in our homes the more meat there will be for the boys in the trenches, for meat can be transported to the trenches, whereas cottage cheese cannot.

If the milk is sweet it should be placed in a pan and allowed to remain in a clean, warm place at a temperature of about 75 degrees until it clabbers. The clabbered milk should have a clean, sour flavor. Ordinarily this will take about forty-eight hours, but when it is desirable to hasten the process a small quantity of clean-flavored soured milk may be mixed with the sweet milk. As soon as the milk has thickened to the consistency of thin jelly it should be cut into pieces the size of a walnut, after which the curd should be stirred thoroughly with a spoon.

Place the pan of broken curd in a kettle of hot water so as to raise the temperature to 100 degrees Fahrenheit. Cook at that temperature for about twenty minutes, during which time stir vigorously with a spoon for one minute at five-minute intervals. At the conclusion of the heating, pour the curd and whey into a small cheesecloth bag (a clean salt bag will do nicely) and hang the bag on a fruit strainer rack to drain. After five or ten minutes work the curd toward the center with a spoon. Raising and lowering the ends of the bag helps to make the whey drain faster. To complete the draining tie the end of the bag together and hang it up. Since there is some danger that the curd will become too dry, draining should stop when the whey ceases to flow in a steady stream. The curd is then emptied from the bag and worked with spoon or butter paddle until it becomes fine in grain, smooth, and of the consistency of mashed potatoes. Sour or sweet cream may be added also, to increase the smoothness, palatability and flavor. Then it is salted according to taste, about one-quarter ounce to a pound of curd.

Cottage cheese is an appetizing dish in itself, but it may be varied by the addition of chopped sweet peppers, chopped onion or parsley, or caraway seed. Some like it in combination with fruit preserves, such as strawberries, figs or cherries, and served with bread or crackers.

An attractive cottage cheese salad may be made as follows: Mix thoroughly one pound of cheese, one and one-half tablespoonful of cream, one tablespoonful of chopped parsley and salt to taste. First, fill a rectangular tin mold with cold water to chill and wet the surface; line the bottom with waxed paper, then pack in three layers, putting two or three parallel strips of pimento between layers. Cover with waxed paper and set in a cool place until ready to serve; then run a knife around the sides and invert the mold. Cut in slices and serve on lettuce leaves with French dressing and wafers. Minced olives may be used instead of the parsley, and chopped nuts also may be added.

If desired, the cheese may be made into rolls to take the place of roasts or meat loaves. These are made by combining the cheese with beans, cowpeas, lentils or peas and adding bread crumbs to make the mixture thick enough to form into a roll. Three such recipes are given below:

Boston Roast—One pound can of kidney beans or equivalent quantity of cooked beans, one-half pound of cottage cheese, bread crumbs, salt. Mash the beans or put them through a meat grinder. Add the cheese and bread crumbs enough to make the mixture sufficiently stiff to be formed into a roll. Bake in a moderate oven, basting occasionally with butter or other fat, and water. Serve with tomato sauce. This dish may be flavored with chopped onions, cooked in butter or other fat and a very little water until tender.

Pimento and Cottage Cheese Roast—Two cupfuls of cooked lima beans, one-fourth pound of cottage cheese, five canned pimentos chopped, bread crumbs, salt. Put the first three ingredients through a meat chopper. Mix thoroughly and add bread crumbs until it is stiff enough to form into a roll. Brown in the oven, basting occasionally with butter or other fat, and water.

Cottage Cheese and Nut Roast—One cupful of cottage cheese, one cupful of chopped English walnuts, one cupful of bread crumbs, two tablespoonfuls of chopped onion, one tablespoonful of butter, juice of half a lemon, salt and pepper. Cook the onion in the butter or other fat and a little water until tender. Mix the other ingredients and moisten with the water in which the onion has been cooked. Pour into a shallow baking dish and brown in the oven.

With all these ways of using cottage cheese there is no excuse for ever having to throw out sour milk and we suggest that Mrs. J. C. P. and others who have not been in the habit of making use of skim milk or sour milk try some of these recipes. The use of cottage cheese will save the milk, cut down the meat bill and please the family as well.

Recipes.

Rhubarb With Bananas.—Four cupfuls sweetened rhubarb sauce, two large bananas, one-third cupful sugar. Slice the bananas thinly in a serving dish. Sprinkle them with the sugar. Pour the hot sweetened rhubarb sauce over the bananas. Set aside to cool. Serve cold.

Stuffed Eggplant Shells.—Two eggplants weighing about one pound each, two tablespoonfuls butter or other shortening, boiling water, one chopped green sweet pepper, one cupful dry bread crumbs, speck pepper, one-half chopped onion. Cut out the inside of the eggplant, leaving a shell about one-half inch thick; cook in boiling salted water for five minutes. Fry the onion, pepper and eggplant pulp, all chopped, in the butter for about ten minutes. Then add the bread crumbs, one and one-half cupfuls boiling water, and seasoning. Fill eggplant shells with this mixtue and sprinkle dry crumbs over the top. Place in a pan with a little water and bake one-half hour.

Cold Fruit Pudding.—Two cupfuls stale cake crumbs, one cupful cooked prune pulp, one cupful whipped cream. If possible, a few fruit cake crumbs should be used in the two cupfuls. The prunes should be measured after the skin and stones have been removed. Mix fruit and crumbs until they are like a smooth paste, then add cream, and beat till well blended. Turn into a shallow granite pan and stand in a cool place for three hours. Cut into square portions for serving and accompany with whipped cream. The prune mixture should not be liquid or the pudding will not be stiff enough.

Stuffed Tomato Salad.—Six medium-sized tomatoes, six stuffed or hard-boiled eggs, lettuce, mayonnaise. Peel the tomatoes. Hollow out to form cups. Dust with salt and pepper and let stand in French dressing for a few minutes. Then slip an egg into each tomato and serve very cold with a garnish of lettuce and mayonnaise.

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

Helps With Haying.

Dear Young Folks:—I am a girl eleven years old and I will be in the eighth grade next year. I live on a 160-acre farm four miles from the nearest town.

We are very busy haying now. My sister drives the team in the field and I lead the horse. We have filled four bents in our barn and we only have one more to fill and then we will have to stack the rest outside.

I go to Sunday school and church most every Sunday. I finish the junior department in October and then I go into the intermediate department. Our class is the C. F. H. class. There are five in my class and we like our teacher very well. We planned at one of our late meetings to dress dolls and make pictures for the little poor children over in India.

I feel very sorry for Vesta and I hope she will soon find a nice friend.

Helen.

Helps Mama, Who is Sick.

Dear Young Folks:—I enjoy reading the Young Folks' page very much, but have not written before. I am twelve years old and in the eighth grade. I have three smaller brothers. They all go to school. I am the oldest, and the youngest is seven years old.

My mama is sick and I do most of the work. She came from the hospital about two months ago.

I can tat and crochet and I love to sew.

There are some birds that built a nest under our porch and there are young ones in the nest now. I like to watch the old bird teach the little ones to fly. She will get a piece of bread and fly to a near-by fence and sing.

We have two dogs to play with.

Lela.

Answer to Ida's Riddle.

Dear Young Folks:—I enjoy reading your letters very much and would like to join your column. I am ten years old and have four sisters and one brother. My brother and oldest sister are married. My brother is a storekeeper and my sister is a farmer's wife.

I live just a quarter of a mile from school. I am in the seventh grade.

We have a Ford automobile and we also have two colts named Champ Clark and Billy Sunday.

I will tell Ida the answer to her riddle: When does a rabbit sit on a stump? I think it sits on a stump every time it sits down because it's tail is nothing but a stump. Is that right, Ida?

Esther.

Joined the Calf Club.

Dear Young Folks:—I would like to join your circle. I am eleven years of age and in the fifth grade at school.

About February 1st they organized a calf club here and my brother and I are members. We got a calf apiece. My brother's calf is giving one gallon and one pint of milk at a milking. We are very proud of our calves.

I like to guess the riddles the Young Folks send in.

Ralph.

[Ralph sent us a riddle for the Young Folks to guess, but we could not publish it because he forgot to send us the answer. You remember we asked you to always send the answer with the riddle. Perhaps Ralph will write again.]

One of the uses to which fruit juice may be put is the making of delightful drinks or fruit punches. When served with plain sponge cake they make a delicious dessert or refreshment for small companies.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Inclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date 1917 spring and summer catalog, containing over 550 designs of ladies', misses', and children's patterns, also some points for the needle. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

2017—Juniors' one-piece dress, with sleeve in either of two lengths. Pattern is cut in 3 sizes: 12, 14 and 16 years. It requires 4½ yards of 44-inch material for a 14-year size.

1697—Ladies' dress, with sleeve in either of two lengths. Pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 6⅛ yards of 44-inch material for a 36-inch size.

Coat Waist 2184-Skirt 2187—A charming three-piece suit. The waist and coat blouse are cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 2⅜ yards of 36-inch material, for the waist, and 3⅜ yards for the blouse, for a 36-inch size. The skirt is cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure, and requires 3⅜ yards of 36-inch material for a 24-inch size. Two separate patterns, 10 cents for each pattern.

2180—Girls' one-piece dress with guimpe. Pattern is cut in 5 sizes: 4, 6, 8, 10 and 12 years. It requires 1¾ yards for the guimpe and 4 yards for the dress, of 27-inch material, for a 10-year size.

2169—A smart dress for mother's girl. Pattern is cut in 4 sizes: 4, 6, 8 and 10 years. It requires 3⅝ yards of 36-inch material for an 8-year size.

2186—Infant's set, consisting of a cap, a sack, a nightgown and a dress. For the dress of flouncing it will require 1¾ yards of 36-inch material with 1¼ yards of plain material for yoke and sleeves. Of nainsook or lawn 36 inches wide it will require 2¼ yards. The gown will require 2½ yards of 24 or 27-inch material. The cap, ⅛ yard of 18-inch material. The sack requires ⅞ yard of 27-inch material.

2030—Boys' blouse suit, with or without shield and yoke facing, and with sleeve in either of two lengths. Pattern is cut in 4 sizes: 3, 4, 5 and 6 years. It requires 2½ yards of 44-inch material for a 3-year size.

2175—Dress for misses and small women. Pattern is cut in 3 sizes: 16, 18 and 20 years. Size 18 requires 6⅜ yards of 44-inch material.

2162—Ladies' two-piece morning or house dress (with sleeve in either of two lengths). Pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires for a 38-inch size, 5⅝ yards of 36-inch material.

2022—A practical ladies' apron. Pattern is cut in 4 sizes: Small, 32 and 34; medium, 36 and 38; large, 40 and 42, and extra large, 44 and 46 inches bust measure. It requires for a medium size 4⅝ yards of 36-inch material.

2190—Ladies' one-piece corset cover, in round, square or "V" neck edge. Pattern is cut in 6 sizes: 32, 34, 36, 38, 40 and 42 inches bust measure. It requires 1⅜ yards of 36-inch material for a medium size.

2046—An ideal porch or morning dress. Pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 6½ yards of 44-inch material for a 38-inch size.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for August 12, 1917.

Josiah's Good Reign.

LESSON TEXT—II Chronicles 34:1-13.

GOLDEN TEXT—Remember now thy Creator in the days of thy youth.—Eccles. 12:1.

The reign of Josiah is in striking and pleasing contrast with that of many of his predecessors, especially that of his father, Amon, and grandfather, Manasseh.

I. Time of Beginning (v. 1). He ascended the throne when only eight years of age. At this tender age he evidently had a sense of the import of the service of God's house. This sense must have been strong to enable him to withstand the corrupt influences of his surroundings. The prevailing idolatry influenced this boy, but influenced him in the opposite way in which boys are usually influenced. It aroused his hatred for it. This serves to demonstrate the fact that circumstances do not necessarily determine the direction a life may go. Each individual has the ability to determine the course of his life; and moreover, his responsibility so to do. It is a most perilous thing to be thrust into such a prominent position while so young. However, sometimes such responsibility has a sobering effect, calling forth one's latent powers. That his aspiration for God and the right was genuine is proven by the fact that he persisted therein for thirty-one years.

II. The Character of His Reign (v. 2). "He did that which was right in the sight of the Lord, and walked in the ways of David his father, and declined neither to the right hand nor to the left." He not only maintained outward order and decorum as to the worship of God, but doubtless at heart desired to please God.

III. Josiah's Reformation in the Kingdom (vv. 3-7). He first set out to root out idolatry from the land. This was a prodigious task, requiring great courage and skill. He did this with a strong hand. Without pity he swept out from the land these abominations. In the execution of this task he—

1. Broke down the altars of Baalim (v. 4). This form of idolatry was first brought into the land by Jezebel when she married Ahad. The images seem to have been such as would appeal to the sensual nature of men; therefore, it was but natural that the grossest licentious practices should be associated with this worship.

2. He broke in pieces the groves, carved images, and molten images (v. 4). He even made dust of them and strewed it upon the graves of those who had been offering unto them.

3. He burned the bones of the priests on their altars (v. 5). He not only showed no pity for them, but he manifested a decided fierceness in the execution of his task.

4. He extended this destruction to certain districts in the northern kingdom. It was not until all this was done that he returned to Jerusalem (vv. 6, 7). His reformation thus began at home, but was extended to the widest extent of his kingdom.

IV. Josiah Repaired the Temple (vv. 8-13). Having rid the land of its idolatry, he set himself to the repairing of the temple which had been so long neglected. This neglect, coupled with gross abuses at times, made it to be sadly in need of attention.

1. His deputies (v. 8). This work he entrusted to a committee of three—Shaphan, the royal secretary (II Kings 22:3); Masseiah, mayor of Jerusalem; and Joah, the recorder, the historian of the nation. In the matter of ridding the city and country of idolatry Josiah took the lead in person, but now the work had gone far enough forward that he could work by deputy. He chose his deputies from among "laymen" instead of the priests.

2. Method of procedure (vv. 9-13). (a) Collection of money (v. 9). It would seem that for some time collection of money for temple repairs had been going on. Perhaps it was begun in connection with the destruction of kingdom, even giving the remnant of agents in this work were the Levites. They collected it from all over the kingdom, even giving the remnant of Israel an opportunity for fellowship in this matter. This shows us that religious interests of the people should be sustained by all the people adhering thereto.

(b) Money placed into the treasury (v. 9).

Hilkiah, the high priest, was the treasurer. From this treasury the overseers drew the money and paid it to the workmen who repaired the temple.

(c) The overseers (v. 12). Among the overseers were certain skilled musicians. The duty of these overseers was to exercise supervision over the carpenters, builders and other artisans, and the helpers of all classes. The musician, by skillful music, incited the workmen to diligence and activity, thus lightening the burdens of their toil. Music in the soul while working bears a very vital relationship to the work itself.

3. The character of the work (v. 12). They did the work faithfully. This is a fine thing to be said of a set of workmen.

Really there is nothing to canning fruit and vegetables except care, cleanliness, fresh products, jars and heat.

Two Great Magazines Now Published As One

Today's Housewife

is the new title of TODAY'S MAGAZINE with which has been consolidated THE HOUSEWIFE. The new magazine, *Today's Housewife*, will be bigger, brighter and better than either Today's Magazine or The Housewife were alone.

THE HOUSEWIFE has made splendid progress from an editorial standpoint in the 34 years it has been published. It has made a place for itself in the hearts and homes of 600,000 women who have enjoyed its intimate "homey" and friendly atmosphere. Those who have liked THE HOUSEWIFE will be doubly pleased with *Today's Housewife.*

TODAY'S MAGAZINE has been the magazine with a purpose. The big idea behind TODAY'S has been that of service. The Editor of TODAY'S, Miss Sarah Field Splint, has been working and will continue to work with heart and soul to help home-loving women in a really substantial and practical way.

The new Homemakers' Bureau recently started in TODAY'S MAGAZINE will continue to be the big outstanding feature of *Today's Housewife*

Facts You Ought to Know About the Wonderful HOMEMAKERS' BUREAU of TODAY'S HOUSEWIFE

This is a thorough, efficient and above all practical course of instruction in the seven important home activities. Really seven complete correspondence courses in drudgeless, wasteless housekeeping. Every word will be authoritative, every formula tested, for we have secured the most famous authorities in the country to direct the courses.

Their intimate, personal talks to you are part of our 1917 plans for the readers of **Today's Housewife.** If you could secure these courses elsewhere they would cost you from $15 to $60 apiece, but many of them could not be had in any other way, for three or four of the lecturers have given up other work to give their time to our readers.

COOKERY AND NUTRITION:
By Miss Caroline Hunt, whose governmental title down in Washington is Nutrition Expert. Her writings on dietetics are considered textbooks.

HOME DECORATION:
By Frank Alvah Parsons—President of the New York School of Fine and Applied Arts, and undoubtedly the greatest authority on interior decoration in America.

HOME NURSING AND INFANT CARE:
By Dr. Josephine Baker, who is the Director of the Bureau of Child Hygiene of the City of New York, and under whose management infant mortality has decreased enormoulsy.

HOUSEHOLD MANAGEMENT AND SANITATION:
By Miss Sarah Josephine MacLeod, head of this same department in Pratt Institute.

FINANCIAL MANAGEMENT AND BUDGET MAKING:
By Miss Winifred Gibbs, of Columbia University, and budget maker for the New York Society for Improving the Condition of the Poor.

DRESSMAKING AND MILLINERY:
Two women of national reputation are now rearranging their work in order to take charge of these departments in TODAY'S. Their names will be announced in an early issue.

Inspiring and Entertaining

But remember that clean, wholesome entertainment will not be sacrificed. Every issue of **Today's Housewife** will afford you and your entire family many hours of pleasure and in addition the inspiration and encouragement that always make both present and future brighter. In other words, **Today's Housewife** is to be the homemakers' magazine of both helpfulness and happiness.

The Motto of Today's Housewife

To uplift, to simplify and glorify homemaking; to bring inspiration and happiness into the life of every subscriber.

Wonderful Value at 75 Cents Per Year

It is now generally acknowledged that **Today's Housewife** is the most noteworthy value among all magazines for home-loving women. The big, broad policy of giving subscribers something really worth while instead of the usual trash found in so many periodicals, is meeting with universal appreciation and approval.

Increase to $1.00 May Be Necessary

We are now paying almost 100 per cent more for paper than one year ago. This means an extra cost to us of 25 cents per subscription. We should really be charging $1.00 per year at the present time, but despite our loss, we are going to delay the increase in price in the hope that conditions will be better next year. All who are wise will subscribe for two years for $1.00, three years for $1.50 or five years for $2.50. The longer term you subscribe for, the more you save.

Over 1,100,000 Housewives Enthusiastically Endorse Today's Housewife

Send your subscription today to **Today's Housewife,** Canton, Ohio. If you don't know how good our magazine is, send only 25 cents for a four months' trial subscription.

Use of Lower-Grade Dynamite.

An Important Lesson in Cheapening Clearing With Explosives Taught by Experiments.—By E. R. McIntyre.

IT BEING the writer's good fortune to travel at times as the official press correspondent on land-clearing trains during the spring and fall of 1916, a few first-hand observations of the work are here set down.

The explosion of a time-worn theory was the greatest explosion in the entire season's operations among the stump-land farms. Settlers had formerly believed that high-grade, quick-acting dynamite was absolutely necessary for successful land clearing. This old idea has been blown sky high, and has never returned. The Wisconsin demonstrations proved conclusively that, save in a very loose, light, dry soil, a 20 per cent grade of ammonium dynamite, costing from 2 to 5 cents less a pound than the grades formerly deemed essential, will do the work fully as well.

Further, such low-grade farm powders are safer to handle, can be used in cold weather to the freezing point of water, and leave the soil in much better condition.

Dynamite blasters on the "show me" excursions plainly convinced the settlers on the Badger cut-over lands that neglecting to put the bore holes in the right position and improper tamping and firing of the charge made the use of a high-grade, quick-acting powder seem advisable.

They took pains to teach the onlookers that the best results follow only when the bore hole under the stump is well placed. They impressed them with the elementary fact that the center of the charge must be placed under the stump at the point where it is held the tightest by the earth.

The end of the bore hole, they emphasized, must be well past the resistance center, and its depth usually thirty to thirty-six inches, and frequently four feet deep under the larger stumps.

As stones, roots and hardpan often interfere with boring, it was pointed out that the crowbar alone is not the handiest and best tool for this purpose. They proved this by the demonstration of special two-inch augers on ordinary soils, an inch-and-a-quarter size, steel-pointed punch bar on muck or sandy soils, and that indispensable tool, the eight-sided driving iron, pounded "home" with a ten-pound sledge.

They showed the visitors that a pitchfork handle answers the purpose of a tamping stick, the requirements of which are that it must be made of wood, and be straight, smooth and strong. A short, round-pointed shovel comes in handy to fill cavities around the stump and to bring dirt to cover the charge, the audience learned.

Other tools to complete the stump blaster's kit in order to get the best results at low cost of time, money and life, as shown to the Wisconsin settlers, included a dynamite thawer, a "safety-first" cap crimper and fuse cutter, and a box for carrying the blasting caps.

However, the big hit of the demonstrations was made by the electric blasting apparatus. Faults of the old cap-and-fuse method, with its slower rate of work, greater expense, greater danger from misfires and less effective results are all remedied when the electric method of stumping is adopted.

Here, in place of the fuse, two copper wires enter the cap, which is sealed at the factory with a sulphur compound which holds the wires in place, thus doing away with hand crimping. Several charges can be loaded under a large stump, the wires connected in a circuit and all set off at once by means of the blasting machine.

This machine is a small, series-wound generator set in a tight wooden box. Current is generated by spinning the armature by means of a plunger. The machine needs no recharging, and with good care it will last a lifetime.

When every one is at a safe distance, and all connections are made, the operator makes one quick downward motion of the plunger and every charge goes off at once. Several times on the recent demonstrations girls and women proudly fired the charge in this manner, thus doing their "bit" for agriculture.

With "blind" or top-rotted white pine stumps, several charges can be placed at points below the several roots, and all discharged at once with the electrical machine. This means that less dynamite will be used than if only one charge is fired under the stump. After the stump is out the hole left is much smaller than where only one charge is fired.

Another important phase of the situation was repeatedly demonstrated and bids fair to get results. The party showed the settlers that very effective work could be done by using hand or horse power stump-pulling machines in combination with dynamite. The blasting was done either before the stump was pulled or afterward, just enough power being used to crack the main part of the stump and break up the root system, making the pulling and piling easier.

More inquiries for settlement, more actual settlers pouring into the upper-lands, and five times the amount of purchases of stumping equipment—this is the gist of the present-day facts.

"Listen to these letters from county agricultural representatives, in charge of farm activities in several of the back-woods districts of Wisconsin," said Dean H. L. Russell, college of agriculture, who has succeeded in obtaining a good appropriation from the state to undertake two years more of energetic land-clearing campaigns.

Just an abstract from some of them will be printed to show the sentiment that refuses to be stumped by the stumps in this day of pressing agricultural need:

Vilas County.—Ten tons of dynamite unloaded here the other day. There will be more land cleared in two months this year than in any five-year period before.

Taylor County.—Farmers want all the dynamite they can get and more, too. Every pound of dynamite in the hands of a good farmer means more tillable land. The bankers are with us and all are busy.

Oneida County.—More than six tons of dynamite will soon be here for immediate use, and farmers will follow with an order for another six tons. There will be more land cleared here than in any two years previous. You have started something.

Ashland County.—Have just completed the little job of unloading and distributing about twenty-one tons of dynamite to our farmers. Stump pulling is surely the biggest single aid to food production that farmers here can give.

Just a word in closing this article: It is hoped most earnestly for the adequate protection and future extension of the food production areas that at no time in our national warfare for democracy will it be found necessary to curtail the output of farm powder—the force which is so rapidly opening up new acres for the plow and the cow.

Pulleys.

From time to time we have received several letters asking how to fasten a pulley to the rear wheel of an automobile in order to use the auto to drive a corn sheller, wood saw or other machine. We published an answer to one of these letters in our last issue. In this issue we are publishing three sketches to explain more fully how this may be done.

Figure 1 illustrates the construction of a small split-wood pulley. This pulley may be clamped on the wheel hub of autos having long hubs of small diameter, like the Ford. It consists of two pieces of wood, bolted together with four bolts, the heads and nuts being countersunk below the surface of the pulley. A socket wrench is used to tighten the nuts. Machine bolts three-eighths of an inch in diameter may be used unless the service is severe, in which case use one-

FIGURE 1

FIGURE 2

FIGURE 3

half-inch bolts. Some mechanics prefer carriage bolts. This pulley is also suitable for use on line shafts. No keyway is required, as the hole is made small enough so that the bolts clamp the pulley on the shaft. Any farmer can make a pulley of this kind if he has a few wood-working tools. If this pulley is to be used to drive a tight-and-loose pulley, where it is necessary to shift the belt, the outside diameter should be the same the entire length of the pulley; that is, the face of the pulley should be straight. If the belt does not have to be shifted, a crown-faced pulley works better, the diameter of the pulley at the middle being about one-eighth of an inch greater than at the ends.

Figure 2 shows a larger wood pulley fastened to the rear wheel of an auto by means of hook bolts, similar to the one shown at A in Figure 3. This pulley is not hard to make. It may be made of a solid piece of wood, but it is better to make it of several pieces of wood, one-half to one inch thick, carefully planed, cut out in circles, covered with liquid glue and bolted or clamped together while the glue is drying. The center hole should be the size of the auto wheel hub, so as to center the pulley. The outside diameter of the pulley may be trued up after the pulley is bolted on the wheel. Start the auto engine and shift the gears into high, so as to turn the pulley rapidly. Nail a board up near the face of the pulley to act as a tool rest. The top edge of the board should be even with the center of the pulley and just clear the face of the pulley. Then, using a half round chisel known as a gouge, true up the pulley, holding the gouge firmly in the hands.

In some cases it is possible to bolt a cast iron pulley to the auto wheel, using U-shaped bolts or clips as shown at B, Figure 3. This clip clamps the spokes of the wheel and the spokes of the pulley.

Questions and Answers.

Battery Worn Out.

I had an electric lighting plant installed a little over three years ago. It has a fifty-light chloride accumulator open storage battery. The party who installed the plant said the battery would last ten years; but to have the liquid renewed every three years. Now I can store but little current, and electricians here say that I will have to get new batteries. What would you advise, and what is the formula for the liquid?

Answer.—The life of a battery depends upon the care it receives; also the service for which it is used. Rapid charging or discharging soon ruins a battery. A house-lighting battery under fair conditions should last at least five years. Allowing the battery to stand in a nearly discharged state or with the plates not entirely covered with the electrolyte tends to ruin it. If the plates of your battery are not crumbled or covered with a white substance known as sulphate you may be able to renew the battery by charging the electrolyte. However, it would be best to write to the company that makes the battery first; possibly they will fix it for you.

If you wish to repair the battery yourself, make the liquid by slowly pouring sulphuric acid into distilled water while stirring the water with a glass rod. Use enough acid so that the mixture will test 1.35 with a hydrometer. One part of acid to a little less than five parts of water by volume is required, but the mixture should be tested with a hydrometer, as the strength of the acid varies. Having mixed the electrolyte, give the battery as complete a charge as possible. Remove the plates carefully from the jars and pour distilled water or clear rainwater over them to remove the sediment. Also wash out the jars with pure water. Replace the plates in the jars and add the electrolyte. Do not allow the plates to dry while making the change. Charge the battery at once. Considerable time will be required to give the battery a complete charge after changing the electrolyte.

Rewinding Telephone Generator.

I have a five-bar telephone generator, the coils of which are burnt out. Would it be practical to rewind it? The generator is made by the Chicago Telephone Co. Where could I get wire to rewind it? Could this generator be used as a magneto on a jump spark engine?

Answer.—It would be best for you to return the magneto to the makers for repairs unless you wish the experience of winding it. In this case, carefully note the manner of winding as you remove the wires. Order the same size wire to rewind it. Your local hardware dealer can order it for you; if not, you can obtain it from any of the well-known catalog houses. It would not be advisable to attempt to use this generator as a magneto to run a gas engine.

Keeping a Battery Charged.

I have a 1917 Ford car with a Ward-Leonard starter. Please give me any information you can as to how to keep my battery charged and up to full strength.

Answer.—In order to keep the battery charged the car should be run at a speed exceeding ten miles per hour. At a lower speed the battery does not charge. When the lights are on a speed of about fifteen miles an hour is necessary to keep the battery from discharging. A charge-and-discharge ammeter is very useful in telling whether the battery is charging or discharging. Where possible, it is best to run at a speed that will keep the battery on two to five amperes charge. Avoid the frequent use of the starter. The starter requires much current; therefore, learn how to start the motor in the shortest time possible. Correct adjustment of spark, throttle and choke valve will often materially reduce the number of turns necessary to start the motor. Avoid leaving the machine stand for a long time with the lights burning.

Once a month add enough distilled water to the battery to keep the plates covered at least half an inch. Occasionally test the gravity of the electrolyte, using a syringe hydrometer. When fully charged the electrolyte should test from 1.2 to 1.4. The test should never be less than 1.15.

HERBERT MOTTER, Official Tester.
D. W. HUENINK, Secretary.

Manitowoc County List.

To the Editor:—We had 491 cows under test in June, and eighty-nine gave forty pounds of butter fat or better. Patrick Cahill's herd of twenty-five head, repeated their forty-pound average, by yielding an average of 1,189 pounds of milk, netting 42.18 pounds of butter fat. William Kelly still has the highest producing cow, with a record of sixty-seven pounds for June. The forty-five-pound list for June follows:

Owner, name and breed	Age	When fresh	Lbs. milk	Per cent of fat	Lbs. B. fat

LEVI BRUNSON, Secretary.

Encouraging Best Settlers.

H. A. Kamn, of Crandon, Forest county, Wis., writes The Wisconsin Farmer concerning the new spirit that has set its mark on the farm and communities near Crandon. One of the large lumber companies has been selling cut-over land in Forest county for some time. It had been its policy to sell land to anyone, regardless of who he might be or where he might be from, but early last year this company organized a land department for the purpose of getting substantial settlers in the district and engaged L. Mordt as manager of this department. Mr. Mordt had previously been engaged in establishing large German and Scandinavian settlements in Oklahoma and Texas. He left the Southwest because of the everlasting drouth and selected Upper Wisconsin as the "one best bet" in the country. This land department was named the Per-Ola Land Company. The results of Mr. Mordt's work have been more than gratifying. For a number of years agricultural development in the Forest county section was at a standstill, but this spring, as the direct result of this work, a score of new settlers, most of them of considerable means, arrived and in the past few weeks these settlers have been extremely busy preparing new ground for this year's crop. We quote from Mr. Kamm's letter:

They are going in strongly for potatoes, oats and hay and truck gardening. Most of these settlers already know The Wisconsin Farmer, as the greater number of them came from the southern part of the state, though quite a few hail from Chicago and Milwaukee. One of the settlers, Mr. Lee Carr, a cigar merchant from the loop district of Chicago, settled here last fall, made several hundred dollars clearing his land in the winter, and is putting in ten acres of potatoes this spring. He is going into the stock and dairy business. Mr. Mordt tells me that he has a number of such men coming up this summer. Among others, the Milwaukee manager of a large millinery manufacturing company. A larger number of settlers are coming during the summer and next fall.

The plan Mr. Mordt has employed is original and unique, as well as very successful. It is called the Per-Ola plan. It includes a coöperative system, which unites the landowners, land buyers, and the sales representatives of the land department, thereby cutting down expenses. In addition to this, the Keith & Hiles Lumber Company offers the settlers substantial assistance in the different farming communities built up under this plan by the free use of the most modern clearing machinery, an appropriation of $7,500 being made for every 5,000-acre unit. The settlers receive clearing machinery as they arrive, and are also guaranteed capital for the construction of cheese factories of the most modern kind, as soon as milk cows are secured in sufficient numbers to make their operation a paying proposition. There are many other features which are interesting, but too numerous to mention here. No settler is located unless he has enough capital to carry himself through till success is obtained.

Most of the settlers who arrived this spring and last fall are of American, German and Scandinavian descent, and, as they all have some cattle, they have increased the live stock and dairy business in this country considerably. All are enthusiastic about this new development around Crandon. The work that has been done here all last year and this spring promises a rich future for all, and I believe that if the other districts of northern Wisconsin, where there are cut-over lands, would offer new settlers more material help and assistance along the line that the Keith & Hiles Lumber Company, through their land department, is offering their settlers, the country would be developed faster.

THE FARMERS' MARKET

WANTED—FOR SALE—TO EXCHANGE

THIS department is to bring the buyer and the seller together. You may want help. You may have live stock, poultry and eggs, or machinery for sale. Maybe you want to sell or to buy a farm. Think how you can advertise now. Write your copy for the advertisement. The rate is six cents per word, each insertion. Note the low cost to reach our 90,000 circulation.

THE WISCONSIN FARMER -:- MADISON, WIS.

HOLSTEIN-FRIESIAN CATTLE.

REGISTERED HOLSTEIN COW, defective udder, richest breeding, bred to a 44-lb. butter sire, $150. R. M. Harriman, Appleton, Wis.

REGISTERED HOLSTEIN BULL, 10 months old; two of his dams averaged 105 lbs. milk in one day and 40.67 lbs. butter in seven days, officially; $150. Wisconsin Live Stock Association, Appleton, Wis.

MONEY TO LOAN.

MONEY TO LOAN on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage. 6% with privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

ALFALFA SEED.

ALFALFA SEED—$8.00 per bushel. Good purity and germination but dark color. Better grades for more money. Write for samples and prices. Henry Field, Shenandoah, Iowa.

RABBITS.

PUT THE BUTCHER'S PROFITS in your own pocket by raising domesticated rabbits. The Pet Stock Journal, Box P, Lamoni, Iowa, will show you best methods for pleasure or profit. Special, eight months for 25c.

FARM LANDS.

SILENT PARTNER WANTED—We have a fine chance to buy fine farms close to the city of Oconto, Wis., suitable for stock farms, that would feed over a thousand head of cattle, at a very low price on account of old age and death of owners. There are over 100 head of thoroughbreds on them now that would go with the farm. There is big money for the party that would furnish the money to swing the deal. Address C. S. Hart, Oconto, Wisconsin.

CHOICE SNAPS—160 acres level lying, easily cleared land; clay loam soil; considerable building timber and firewood; good stream of water; splendid stock proposition; on good road; school, church and cheese factory 2 miles; $15 per acre. An 80 at $10 per acre; a 40 at $300. One-fourth down. Can be had without down payments. Write for particulars. The Ev. Luth. Colonization Co., No. B-M, Dept. 10, Merrill, Wis.

HARDWOOD cut-over land, silt loam, clay subsoil. Not sandy or gravelly. Close to towns. Good roads. In the heart of the dairy country. You deal direct with the owners. No agents and no commissions. Easy terms. Write for map and booklet 9. North Western Lumber Company, Land Department, Stanley, Wis.

A REAL BARGAIN, 640 acres, clay loam soil. 80 acres of valuable hardwood timber, balance open land, covered with clover and grass. Two small houses and barns, 20 rods to fine fishing lake, two miles from two railroad towns, best sheep or stock proposition in northern Wisconsin. Will divide in quarter sections. Only $20 per acre. Terms to suit. No trades considered. Other smaller tracts also. F. M. Doyle, Ladysmith, Wis.

SQUARE QUARTER, Red River Valley land, all under cultivation, buildings little value, three miles from two good railroad market towns. Best quality soil, well drained, no waste land; excellent neighborhood. $45 per acre for quick sale, easy terms, 6 per cent, no trades. C. L. Lindstrom, Grand Forks, N. D.

FREE! FREE! FREE! To every homeseeker our new land list and state map, showing pictures of a large number of choice central Wisconsin dairy and grain farm bargains. Write today. Graham's Land Office, Marshfield, Wis.

70 ACRES good clay loam soil, 3½ miles town, 1½ to creamery, across road from school. About half under cultivation, running water and orchard. Price, $40 an acre, half down. L. H. Rockwell, Jr., Downing, Wis.

WOULD YOU SELL YOUR FARM if you got your price? Sell direct. No commissions. Particulars free. Charles Renich, G-2, Woodstock, Illinois.

240 ACRES IMPROVED, in drainage district of Wisconsin; good buildings; $40 an acre. Lewis Bros., La Crosse, Wis.

LIGHTNING RODS that are guaranteed protection. $250.00 to find a building burned by lightning with our rods. L. F. Diddie Co., Marshfield, Wis.

HONEY.

HONEY—Pure extracted honey. Better and cheaper than butter or sauce. Price list on application. M. E. Eggers, Station M, Eau Claire, Wis.

RED POLLED CATTLE.

RED POLLED BULL CALVES, good ones. Iver Iverson, Manchester, Minn.

HELP WANTED.

WANTED—Farm hand. Kindly state wages desired in first letter. Also want girl for general housework. Roy Dolphin, Montfort, Wis.

LEARN TELEGRAPHY.

TELEGRAPH OPERATORS IN DEMAND—One superintendent writes: "Can use 25 operators tomorrow." Ladies or gentlemen. Wisconsin School of Telegraphy, Oshkosh, Wis.

LEARN TELEGRAPHY—Positions guaranteed; Young men and women. Write Northwestern Telegraph School, Eau Claire, Wisconsin.

POULTRY AND PET STOCK.

FOR SALE---S. C. RHODE ISLAND REDS

GOOD BREEDERS from exhibition and trapnested laying stock. Write for prices. **WINNEBAGO POULTRY YARDS, A. J. Schloerb, Mgr., R. 23, Omro, Wis.**

BARRED PLYMOUTH ROCKS and Buff Orpington ducks; Chicago winners; great layers; established 1892; eggs for hatching: $1.50, 15; $4.50, 50; $8, 100; prompt delivery and good hatch guaranteed. G. Earl Hoover, R. 24, Matthews, Ind.

HATCHING EGGS; prize-winning S. C. Reds, White Wyandottes, Buff Orpingtons, S. C. White and Brown Leghorns, $1.50 per 15. Ledge View Poultry Farms, Box W. F., Fond du Lac, Wis.

FARM FOR SALE—133 acres, heavy clay loam; 30 acres timber, balance productive fields that produce acre for acre as much as any land in the West; great markets; ½ mile from town and railroad; new 10-room house, full basement; telephone; large new basement barn, hen houses, fruit; fine climate, mild winters. Price $3,000, half down, balance on easy terms. Send for free photos and description. A. L. Wilkins, R 1, Union, N. Y.

A SMALL FARM in California will make you more money with less work. You will live longer and better. Delightful climate. Rich soil. Low prices. Easy terms. Sure profits. Hospitable neighbors. Good roads, schools, churches. Write for our San Joaquin Valley illus. folders, free. C. L. Seagraves, Ind. Com'r, A.T.&S.F.Ry., 1959 Ry. Ex., Chicago.

PATENTABLE IDEAS WANTED. Manufacturers want Owen Patents. Send for 4 free books; inventions wanted, etc. I help you market your own invention without charge. Richard B. Owen, 37 Owen Bldg., Washington, D. C.

Live Stock and Commercial Notes.

Gathered by Representatives of The Wisconsin Farmer.

One of Wisconsin's Holstein Foundation Herds.

WHILE visiting Rust Brothers, West Allis, Wis., last week we again had the opportunity of noting the splendid work which has been done in this noted herd, from which foundation stock has been sold that has formed the nucleus of many of Wisconsin's most noted herds. Rust Brothers likewise have sold much stock that has gone to foreign countries especially Japan. At present they have in their herd a number of exceptional cows with records ranging from 27 to 33 pounds of butter in seven days. Rust Brothers' herd has also made its appearance at the Wisconsin State Fair for a greater length of time than any other herd in the state and in this connection it may be said that its appearance has always reflected credit upon its owners. They have on hand at present a number of promising young bulls that should be of interest to many breeders throughout the state wishing to select a herd sire bred along the lines of high production, good individuality and plenty of size. Sir Ida Lotta Hengerveld, a grandson of Ida Lotta 5th, a 29.47-pound cow that has also a semiofficial record of 17,980 pounds of milk and 816 pounds butter in a year, is a promising young bull, that is being offered for sale at a very reasonable figure considering his ancestry. In this connection it might be added that they recently sold a bull calf from their 33-pound cow for $1,000. Breeders wishing to get the right kind of foundation stock would do well to correspond with Rust Brothers with reference to the bull calves they now have on hand.—Adv.

Big Bone Wonder—Martiny.

SEVERAL times we have called the attention of our readers to the good Poland China boar, Big Bone Wonder, owned by L. P. Martiny, Chippewa Falls, Wis. We have had this boar slated as a winner at Milwaukee and we made a trip to see how he had done since we saw him in March. We found L. P. "down in the mouth" when we asked him how the good boar was getting along. The pigs by Big Bone Wonder looked so good that he was anxious to get some fall litters by him and in breeding a sow the boar, in some manner, wrenched one of his hind legs and he has been lame for several weeks and incidentally "off feed." This was indeed a great disappointment to Mr. Martiny, for he had reason to be proud of this boar and wanted to show him at Hamline and Milwaukee. As it is he won't be in condition to take out now. There are some good gilts and boars on this farm sired by this boar, also some by other boars out of some real big-type sows. The writer weighed a couple of the brood sows, neither of which are going to be shown and neither are getting any grain, simply running on pasture. One weighed 530 pounds and the other 570 pounds, so you can glean from this that they are "big type" and are in the 800-pound class. Mr. Martiny will have a futurity litter at Milwaukee that is "some litter." This breeder has some vey fine Guernsey bulls ready for service. They are of the very best breeding and are being priced worth the money. If you want Polands or Guernseys, it's to your own interest to get in touch with Mr. Martiny. Kindly mention this paper. See page 18.—Adv.

Atwater Donates Pig to Red Cross.

WE have been advised that L. F. Atwater, the popular Duroc Jersey breeder of Bangor, Wis., is going to donate one of his very best pigs to the Red Cross. This pig will be disposed of at the Wisconsin State Fair, and Mr. Atwater assures us he is giving one of the best boars that he has in his herd this year, and he is arranging a unique plan for the disposal of the pig and makes this further promise that if the man who buys the pig would rather have $100 than the pig, he will give him the $100 and keep the pig. It is possible that some city folks under the plan arranged may get the pig and in this event, Mr. Atwater thinks that they would rather have the cash than the animal. The fact that Mr. Atwater is willing to give $100 for the pig is proof that the boar will be one of the best of his spring crop. We are glad to see breeders take this interest in the Red Cross Association's work.—Adv.

R. C. Church Has Good Boar.

WE recently saw the R. C. Church Duroc boar that was purchased in the Atwater boar sale last fall. We thought this was the best boar sold in the sale and we are still of the same opinion. He is not fat, but Roy has grown him in nice shape and if he was in condition he would be the biggest junior yearling that we have seen in the state. He is big all over, has good feet and bone and a wonderful back. He is sired by Great Chief, a son of the noted Cherry Chief, and he is out of a daughter of Lee's Defender. Mr. Church has a number of good pigs by this boar that will be offered for sale later. Don't forget that R. C. Church, Elkhorn, Wis., has one of the good boars in the state.—Adv.

Gant's Farm Durocs.

THE Gant's Farm Durocs are doing fine. There are around 100 pigs on the farm and they are all doing nicely. Many of them will weigh well over 100 pounds and none of them have been pushed along for show, but by the first of September there will be some boars and gilts in this bunch that will compare with the best of them. The Durocs on this farm represent the most popular blood lines known to the breed and in due time we will tell you all about them. The litter by Orion Cherry King is coming along in fine shape and there should be some "scramble" when these are offered for sale. The advertisement will appear in this publication in due time.—Adv.

Prepare Early For the Madison Sales.

IT IS a settled fact now that the Poland China, Chester White and Duroc Jersey state associations will hold sales at Madison next winter, either the first or second week in February. It is very important that the very best animals be sent to these sales. There were Durocs and Polands consigned to these sales last winter that should have gone to the stockyards. Breeders now see where they made mistakes and we hope for outstanding individuals for the sales next winter. Now is the time to make your selections for this sale—pick the best gilts and carry them along for this event. Pick something that you would like to keep yourself—don't send a sow that is not good enough to keep in your own herd—the other breeders don't want her any more than you do. It should be the ambition of everyone consigning to these sales to be the consignor of the sow that topped the sale. The secretaries of the various associations want to know just as soon as possible the names of the breeders that expect to have entries in these sales. If there is any information you want write the secretary of your state breed association or you can write The Wisconsin Farmer. Prepare now to boost your game.—Adv.

Duroc Jersey Breeders Meet at Madison.

THE directors of the Wisconsin Duroc Jersey Breeders' Association, met at Agricultural Hall, Madison, Wis., Saturday, July 28th, to discuss the feasibility of holding another bred sow sale at Madison next winter. All those present were in favor of such a sale and committees were appointed to make necessary arrangements. The date for the sale cannot be settled just at this time. There is some talk of having another "swine week" the week following "farmers' week." A committee was appointed to confer with members of the other state swine breeders associations and arrange for a week of sales if possible. This joint meeting will be held during the state fair at Milwaukee. The sales were a grand success last year and we see no reason why they cannot be an annual event. The Poland China breeders, the Chester White breeders and the Duroc Jersey breeders now contemplate sales of their respective breeds next winter. As yet it is not decided whether the Hampshire or Berkshire breeders will hold a sale or not. We hope they can get together and be represented.—Adv.

W. C. Scheibe, Burlington, Wis.

MR. SCHEIBE, as usual, is getting ready for the fall fairs and has a number of promising individuals coming on nicely, including his herd boar, Perfect Prince, that was shown last year at five fairs, including the Wisconsin State Fair. He has thus far been undefeated in his class and has been champion over all breeds at two fairs. He is an exceedingly smooth individual and will offer the keenest kind of competition this fall. Mr. Scheibe also has a couple of sows that look like winners, as well as a number of spring pigs which are in a thrifty condition. Mr. Schiebe's yearling fall boar purchased from Arthur Thompson, Wabash, Ind., sired by Royal Blood, is likewise a good individual, as well as Guy Comet, sired by White Prince.—Adv.

W. W. Goodrich, Ft. Atkinson, Wis.

THE above man lives near Ft. Atkinson, Wis., and besides being in the Holstein business he also keeps registered Duroc Jerseys. Just at this time he has some 50 head of spring pigs that are being offered for sale. Most of them are sired by Defender Major 2d, he a son of the $1,500 Defender Major by the $10,000 Defender. The dam was a daughter of the grand champion, Volunteer. The pigs are stretchy, high-backed fellows and should give satisfaction. He also has a late litter by the grand champion, King Defender. Mr. Goodrich will give you a good deal and if you are interested it will pay you to write him. Please mention The Wisconsin Farmer. See page 18.—Adv.

L. V. Garvens, Brookfield, Wis.

MR. GARVENS is now offering his herd bull, Hengerveld Salo De Kol Beets, that is mostly white, a good individual and large for his age. He is a two-year-old son of Hengerveld De Kol Beets, and out of Aaltje Salo De Kol Pontiac, that has 748.76 pounds butter and 15,623.90 pounds milk in a year. Mr. Garvens also has several young bull calves that are typey individuals that can be purchased at a reasonable figure.—Adv.

Reuben Klafonda, Racine, Wisconsin.

MR. KLAFONDA'S ability as a show man and tester has brought him into prominence in Holstein circles quite frequently the last few years and he is now contemplating a dispersion of his entire herd at the Lake Mills sale this fall. This herd consists of nine aged cows most of which have very creditable A. R. O. records ranging from 25.6 pounds as a junior four year old to 27.7 pounds at full age. These cows are in calf to a 30-pound bull, North Star Parthenia Sir Beets. It will be remembered that one of his noted cows, Kolantha Piebe of Elm Court stood second in the aged cow class in 1913 at the Wisconsin State Fair. She is a large cow of exceptional capacity and possesses the lines necessary to win in the show ring today. Mr. Klafonda also has in his herd a 31-pound bull calf sired by North Star Parthenia Sir Beets as well as a bull calf out of a 25.6-pound junior four year old. Mr. Klafonda is now advertising his herd sire which is a two-year-old bull, Racine Johanna Bessie Piebe, that is by Johanna Kolantha Sarcastic Lad II, and is out of his 25.6-pound junior four-year-old cow that is a splendid individual.—Adv.

Harvey Longley, Dousman, Wis.

MR. LONGLEY'S Guernsey herd, to our knowledge, never has put up as good an appearance as it does at the present time and one who has been in a position to watch Mr. Longley's progress as a Guernsey breeder cannot help but appreciate the rapid progress which he has been making. His aged cows present a uniformity of high producing type that is pleasant to note and his two-year-old heifers, as well, look as though they would be able to hold up the present high standard of his herd in production. Mr. Longley stated that he would price two or three of his aged cows, several of his two year olds, as well as six yearling grade heifers. Anyone interested in Guernseys of this character would do well to correspond with Mr. Longley concerning his herd and we take pleasure in recommending it from the fact that it is now on the state accredited list and that we have absolute confidence in Mr. Longley's reputation as a breeder.—Adv.

Some Very Choice Herefords.

WALTERS BROS., Chippewa Falls, Wis., will have a Hereford show herd out this fall that will be a credit to them, and the state of Wisconsin. They will be shown at all the leading fairs in the state and our readers that are interested in this herd should arrange to visit some of the fairs that they "make." They will have with them some young bulls that are choice and they are for sale. If you will write them they will send you a list of the fairs that they will attend and you can arrange to see their stock then. This, perhaps would be easier for you than to go to Chippewa Falls. The young bulls they offer are sired by Beau Gomez 2d, he by Beau Gomez that sold once for $4,000 and last year he was sold at auction for $3,900, so you can see that their bulls come from well-bred stock. Write them your wants and mention this publication. See page 19.—Adv.

Silver Spring Farm Bull—Money-Maker.

THE Silver Spring Farm Co., Eau Claire, Wis., are offering a six months old Holstein bull that will certainly make money for the man that buys him. He is sired by an A. R. O. bull and his dam has an A. R. O. record and is a fine individual. The advertisement that appears on page 19 of this issue gives his breeding, price, etc. This exceptional offer will not last long, so if you are going to need a bull of this breed, here is your opportunity. In corresponding with the owners please mention The Wisconsin Farmer.—Adv.

Grant County Durocs.

ROY HORSFALL is another one of those Grant county breeders that are producing better Durocs. He lives near Mt. Hope and can ship from Fennimore on the Northwestern or from Bridgeport on the Milwaukee. Roy has taken good care of his pigs and he can sell you a boar and a few gilts that you will be pleased with. His price is very reasonable, considering what you can get for the money, and once a customer, always a customer. We will have more to say about this herd later.—Adv.

Sale of Young Stock.

THERE has been great activity in the sales department of the Pabst Stock Farm during the past few months. According to advice just received from Fred Pabst, practically all of their older calves have been disposed of. The oldest one they now have on hand is Pabst King De Kol Maplecrest. Among the recent sales that have been made is that of Pabst Korndyke Killarney which was purchased by the Bechaud Brewing Company, of Fond du Lac. This is a nice, straight calf, light in color. The dam has not been tested. This is her first calf and she will be tested next season. George J. Wiesemann, of La Grange, Mo., recently bought Pabst Korndyke Alder. This is a straight calf, light in color and with plenty of substance. W. H. Johnston, of Troy Center, Wis., has secured Pabst Terzool Korndyke. The calf has a wonderful capacity. His dam is a large cow with the well-balanced King Pontiac Champion udder. Another purchaser from Troy Center was Charles Arnold, who bought Pabst Barberry Korndyke. This is a nicely marked calf, more white than black, with a white face, and a good straight individual. See page 19.—Adv.

McKerrow's Big Sheep Sale, Pewaukee, Wis., August 15-17.

This event should be a record-breaker as McKerrows are offering sheep of the highest quality, including fifty Shropshire breeding rams, twenty-five Oxford breeding rams, thirty Shropshire yearling ewes, that have just arrived from England, fifteen Oxford ewes and show sheep of all ages. McKerrows have arranged for the following men to take care of the mail order business. Prof. Frank Kleinheinz, Agricultural College, Madison, Wis.; Prof. W. C. Coffey, Agricultural College, Urbana, Ill.; Prof. T. G. Patterson, University Farm, St. Paul, Minn., and Secretary W. C. Shafer, of the American Oxford Association, Hamilton, Ohio. See advertisement on page 18.—Adv.

Orrin Hake, Jefferson, Wis.

MR. HAKE is one of Jefferson county's most progressive breeders who has shown the wisdom of selecting the right kind of a herd sire. His herd header is by King Pontiac Champion, one of the most noted sons of King of the Pontiacs, now at the head of Fred Pabst's Holstein herd, and is out of K. S. P. Dione, that has 29.15 pounds of butter in seven days and 724.35 pounds of butter in a year. This cow is one of Mr. Pabst's good ones and is recognized as being the best producing daughter of King Segis Pontiac. Mr. Hake is now offering several young bull calves for sale out of consistent producing dams.—Adv.

Oxfords, Polands, Short-horns.

IF you want a registered Oxford ram, if you want a registered Poland gilt or boar, if you want a Short-horn bull write to P. N. Collins, River Falls, Wis. Mr. Collins has been breeding pure-bred stock for some time and he enjoys a good business and the noticeable feature is the fact that he sells to the same men year after year. He will be pleased to describe what he has for sale of the various breeds, and we are confident that the prices will be within reason. Write at once, and please say you saw the advertisement in The Wisconsin Farmer. See page 18.—Adv.

William O'Leary, Honey Creek, Wis.

MR. O'LEARY'S herd of Holsteins, mostly daughters of Green Valley Thorndyke Vilma makes a very creditable showing as we had an opportunity to inspect them several days ago while

POLAND CHINA SWINE.

100 BIG-TYPE POLAND CHINA SPRING BOARS AT $30.00 EACH

Double treated, and we record them. They will be worth $30.00 on the market by the time you are ready for their service. Farrowed in last of February, March and April, the greatest lot of high-class pigs we have ever raised, long and deep bodied, heavy boned, nicely marked and good backs.

They are from the most noted families of the great breed, sired by Giant Jumbo 2d, the 700-lb. year-old son of Giant Jumbo, whose sire was the 1,055-lb. Maid's Halvor 1st; his dam sired by the 1,000-lb. and over Big Bone 2d, his grandam by Mouws, noted Big Jumbo. There is no bigger breeding. Others by Long Expansion, a 900-lb. two year old, and Pawnee Wonder, a 1,000-lb. son of A Wonder.

The dams are sows weighing from 600 to 800 lbs. and over, of the most intense big-type blood lines. Buy your boar now and save from $20 to $50. Boars will be high and scarce this fall.

Send your check right with the order, tell us the kind of a boar you want and we will send him or return your money. Come and see our herd, one of the greatest in America, as well as one of the most up-to-date, pure-bred stock breeding establishments.

W. H. COOPER Hedrick, Iowa

THE UTMOST IN POLAND CHINAS

FARM HELP WANTED.

John H. Gothye, Hancock, Ia., wants man until after harvest and corn husking.

What does silage cost? Considering the cost of growing the crop, interest and depreciation on investment, and cost of filling, silage costs about $2.80 a ton, say the agricultural engineers at Ames, Iowa. They figure it as follows: A survey of a large number of farms indicates that it costs very close to 80 cents a ton to put up silage, including cost of cutting, hauling, packing and rent for engine and ensilage cutter. The cost due to interest and depreciation, figured at 5 per cent each, is about 50 cents for an average 100 to 140-ton silo, which costs approximately $500. Cost of growing will come to about $1.50 a ton, which includes rent of corn land, cost of plowing, seeding and cultivation. This totals $2.80 for the cost of a ton of silage.

Oxfords Polands SHORT-HORNS

Big strong rams that will please. Sows bred to farrow this fall—gilts and boars. Best big types. What do you want?

P. N. COLLINS RIVER FALLS WIS.

160 BIG-TYPE POLAND PIGS 160

HOLSTEIN-FRIESIAN CATTLE.

Milford Meadows Stock Farm

OFFERS FOR SALE a very well-bred bull calf by Dutchland Creamelle Denver Prince (165048) that is better than a grandson of Colantha Johanna Lad and out of Canary Ormsby Johanna De Kol, a 28-pound three year old, 111.95 pounds in 30 days, which is practically a perfect individual. Write for extended pedigree. Other bull calves out of A. R. O. dams by same sire for sale.

EMMONS BLAINE, Prop. Lake Mills, Wis.

TWO-YEAR-OLD HOLSTEIN BULL

A BULL THAT WE GUARANTEE to be right in every respect and just as we describe him or no sale. He is straight, good size, well built, nicely marked, more white than black and throws light-colored calves; whose eleven nearest dams have good A. R. O. records. Sire's dam, Princess Mercedes Riebe at four years made 26.39 lbs. butter and 561.50 lbs. milk; at two years, 667.39 lbs. butter and 17,400.70 lbs. milk for one year. Sire's grandam at four years made 18.23 lbs. butter and 474.10 lbs. milk and 909.91 lbs. butter and 21,611.70 lbs. milk for one year. The dam of this bull made nearly 21 lbs. butter at three years of age; her dam made 16 lbs. butter at two years of age and her dam made 16.60 lbs. butter. If you are in need of a bull come and see this one, or write for a tabulated pedigree and price to Mountain Ash Stock Farm.

J. B. CAIN, Prop. Glenbeulah, Wis.

Are playing an important part in the development of the Holstein Breed in America. There are over 300 head in this State Accredited herd.

We sell bull calves at a price ranging from $150 up. Send for list.

Purebred Registered

HOLSTEIN CATTLE

Prof. Carlyle of the Wisconsin Experiment Station asserts that "It will be readily seen that the Holstein cow has the ability to digest coarser feeds and work them over to a better advantage than Jerseys and Guernseys and this is a strong point, in which I contend that the Holstein has a great advantage over any of our smaller breeds, and it is a point which is going to appeal to the farmer in the future far more than it has in the past." There's big money in the big "Black and White" Holsteins.

Send for FREE Illustrated Descriptive Booklet.

Tractor Demonstration at Fremont, Nebraska

THE national tractor demonstration held at Fremont, Nebraska, last week, under the auspices of the tractor and thresher division of the National Implement and Vehicle Association, was a mammoth affair. This was the fifth event of this character and the number of tractor entries as well as the attendance eclipsed all former records. When the first demonstration was held in 1913, the tractor was a novel thing and a quarter section of land answered all the demonstration needs that year, as there were but eighteen entries. The next year it required a half section to furnish a workable area for the twenty-eight tractors. In 1915 400 acres were plowed by the forty-eight tractors that participated. Last year there were nealry 100 tractors on the ground and 800 acres of land was required for the demonstration. There were eight demonstrations in all last year, but the officers of the National Implement and Vehicle Association decided that in 1917 there would be but one contest, requiring an area of 3,000 acres to care for all the entries. This land was available in the vicinity of Fremont and there were tractors enough on hand last week to plow every foot of it.

It was made plainly apparent last week at Fremont that the days of "tractor bluff" were over. Manufacturers have learned that the farmer knows a good honest furrow when he sees it. There were as many as 30,000 and 40,000 visitors on the grounds daily last week and, unquestionably, among this number would be thousands who were seriously contemplating supplementing their horse power with tractors. Most men believe in plowing deeper than they actually practice. They are convinced that they have skinned over the soil at a depth of three or four inches long enough and it was therefore a pleasing sight to see many plowing outfits last week cutting eight inches deep in a stiff soil. The comment that one could hear on every hand regarding these deep furrows was of the most favorable character, because it is a well-known fact that the deep-plowing farmers on the whole are the individuals who raise the biggest crops.

Never before have the tractor demonstrations been made so intelligible for the visitor as was the case this year. Every outfit was placarded, showing the brake horse power of the engine, the revolutions per minute, the plowing speed in miles per hour and the kind of fuel used. There were some mammoth outfits in the contest, some of them capable of plowing thirty acres a day, but interest in the main centered in the tractors capable of pulling two and three plows. These were followed mile after mile by men who realized new possibilities in crop production as the result of using an equipment that would do the heavy work of soil tillage quickly and do it thoroughly. The three-furrow plows were turning land at the rate of eight, nine and ten acres a day—an area that would require two men, each operating a four-horse outfit. If one might judge from the comments heard on every hand last week it would be safe to conclude that visitors on the whole were convinced that power farming had come to stay. Here and there on the grounds could be found men who had tried out the tractor in a practical way and were enthusiastically championing its cause.

THOUSANDS OF VISITORS WALKED THE HEADLANDS CONTINUOUSLY WHILE THE TRACTORS WERE AT WORK.

Coincidental with the development of the tractor has come the improvement of a tractor plow, and the character of the work done in the fields this year far surpassed the demonstrations of the past. Surface trash was well turned under and the furrows in most instances were straight and true. The plows entered the soil at a marked line and were taken out at the end with a pleasing abruptness that would be the envy of skillful horse plowmen. Apparently plow manufacturers have faith in the coming of the tractor, judging by the skill that they have displayed in adapting their plows to this form of power.

But the work last week was not confined wholly to plowing. There were drills in the field, many disks, surface packers, harrows and, indeed, an innumerable variety of surface tillage implements. Even corn planters and cultivators were operated with gas. While plowing is an important branch of tillage it is not the whole thing: Keen interest was displayed last week in the work of harrowing, disking, drilling and packing the soil. At these tasks many of the tractors seemed at home. Putting the soil in shape after it is plowed is heavy work on horses because the footing is bad and an important part of their energy is taken up in walking over the land. The big-wheeled tractors seemed to move over the mellow ground with ease, leaving it in most cases in ideal condition for a seed bed. Even the smaller tractors were doing the double work of disking and harrowing and this made strong appeal to those who all their lives have been handling but one implement at a time, even with four- and six-horse hitches.

Interest in tractors has been greatly stimulated by the rapidly increasing price of grain. One visitor, who owns a 440-acre farm, was displaying special zeal over the workings of a 12-20 tractor. He was accompanied by a neighbor who was an enthusiastic champion of the horse and who was a sure-enough Doubting

(Concluded on page 10.)

CURRENT EVENTS

THE cheering word is brought back from Russia, by the commission headed by Elihu Root, former secretary of state, that the republican form of government, recently established, is certain to be maintained if this country will give the Russians assistance and if Kerensky, the Russian republican leader, is spared to his task. If the Russian government becomes stable the Russian army will once more become a big factor in the war and much of the responsibility of the United States will be lessened. Without Russia, the United States will have to bear a much heavier brunt of the war. Unqualified encouragement from the United States, moral and financial when necessary, is essential to keeping life in the new government, the commissioners agreed. A separate peace with Germany is the gravest fear. Left to fight along with her present government in control, the president was told, Russia will emerge triumphant and strong, but if either by great masses of troops or clever propaganda Germany should accomplish the overthrow of the Kerensky government, the outlook would be dark indeed. General Hugh Scott, a member of the commission, was with the Russian army in some of its fiercest campaigning and he is enthusiastic over the bravery of the Russian soldiers and the part the Russian army is taking in the general campaign.

PRESIDENT WILSON won out over congress in his fight for the food regulation bill. The bill was finally adopted by the senate last week by the decisive vote of sixty-six to seven, Senators Gronna, of North Dakota, and La-Follette, of Wisconsin, being prominent among the few who voted against it. The president is expected to appoint Herbert Hoover, of the Belgium relief commission, food administrator, to begin active service at once, following the preliminary plans which he has been formulating while congress was working on the food bills. In addition to its comprehensive provisions for control of food, fuel, fertilizer and farm equipment, the control bill carries drastic prohibition features. Thirty days after it is approved it will be unlawful to use foodstuffs in the manufacture of distilled beverages or to import distilled spirits for beverage purposes, and the president will be empowered to commandeer for military purposes distilled liquors now held in bond and to regulate or restrict the use of foods in the manufacture of wine and beer. A minimum price of $2 a bushel for wheat, at primary markets, is established in the bill, as passed.

DEFINITE assurance that the American public will be protected against profiteering and that the allied governments will get their war supplies at the same prices as the United States, is contained in an announcement of the administration's war price policy. Prices now charged for materials necessary to the industrial life of the nation are out of all proportion, the announcement said to the cost of production. "Unconscionable profits," it is declared, are made on national resources entering into the manufacture of articles to be consumed by the public. Already the administration is preparing for drastic action to reduce prices, if negotiations with manufacturers fail to produce results. Robert S. Lovett, of the war board, declared the government was ready for such a contingency and felt confident it could meet the situation. If possible, he said, it hoped to achieve results without resort to legislation. In the senate Senator Pomerene introduced a bill to authorize the president to fix the prices of iron ore, iron, steel and their products, and to regulate their production and sale through the federal trade commission. Full power to control the sale and distribution of foods, feeds, and fuel was given to the government in the final passage of the food control bill.

THE national guard in every state in the Union became part of the regular United States army last week. Statements issued by the war department place the total force of national guard thus taken into the federal service at 13,093 officers and 419,834 men. Another statement showed that 180,766 war volunteers have been recruited for the regular service since April 1st, leaving only about 2,000 vacancies in the regulars at war strength. These figures mean that approximately 725,000 men are now under arms exclusive of the navy and marine corps, to be supplemented within the next few weeks by 687,000 raised under the selective draft bill. Of the latter number about 500,000 will compose the third great element of the war army, the national army, and the remainder will go to fill up the regulars and the guard and their reserves. Most of the national guard will be sent to New Mexico, Texas and other southern states for winter training and then over to France in the spring, to reënforce the regular army troops already there and to be sent within the next few months.

SENATOR JAMES H. LEWIS, of Illinois, after a conference with the president last week, issued this statement in regard to peace rumors afloat at the national capital: "I do not quote the president, but do say for myself that when the true signs of peace based on the principles for which America went into this war shall appear, the president will be the first to treat with them; but when they shall come disguised as peace—only to serve the further cruelties of war—and the betrayal of America, Woodrow Wilson will be the last to be caught. The country will hear from the president on peace or war just as soon as truth or any new actual conditions call for him to take congress and the people into his confidence. He will allow the American people to lose no right nor suffer any wrongs his diligence would prevent." The Illinois senator told the president he believed congress could adjourn September 1st. There is a quite general belief that Germany's peace hints are not made in good faith, but mainly for the purpose of delaying the United States' war preparations and to give Germany a time to catch its breath.

RAILROADS of the United States gave 16 per cent more freight service in May, 1917, than in the corresponding month a year ago, with virtually the same number of cars and locomotives, according to a statement made public by Fairfax Harrison, chairman of the railroads war board. This is interpreted, the statement pointed out, as "a gratifying indication of the extent to which the railroads of the United States are making effective their efforts to produce greater transportation efficiency to aid in winning the war. Actual returns just compiled," the statement said, "are from railroads having 173,105 miles of line. The reports show that these lines in May last year gave service equivalent to carrying 25,426,845,011 tons of freight one mile while this year they carried 29,522,870,109 tons one mile, an increase of 16.1 per cent.

THE health of Alexander F. Kerensky, Russia's man of the hour, is a matter of grave concern to his friends and associates, according to members of an English delegation which has just returned from Petrograd. Premier Kerensky's health was none too good when he took office and the strain since has been not only constant, but probably heavier than any other statesman's in the world today. His friends say that only his tremendous will power and nervous energy have kept him going so long. Those who have seen the Brilliant Russian leader in the last few weeks describe his face as being haggard and drawn and his figure emaciated, his voice still strong and vibrant, but speech marred by frequent coughing, his eyes brilliant, but not with the brilliance of ruddy health. "If Kerensky can only hold out," is the phrase more and more frequently heard among his friends and admirers, indicating their dread of his physical collapse and what that would mean to the destinies of free Russia.

OUT of one detail of 1,350 wounded men sent for special treatment to a London hospital suffering from crushed and broken bones, 1,000 were able to return to active duty at the front, according to Maj. G. E. Goldthwaite, an orthopedic surgeon of the United States army medical reserve corps, on his return from Europe. Major Goldthwaite is one of the twenty American medical officers who have been in France and England observing and studying new methods of treating wounded. He said he returned to the United States to recruit surgeons who could be given the advantage of similar study in order that the American army when it gets into action may have the benefit of the modern treatment of wounds from its own surgeons. Major Goldthwaite added that were it not for the successful method of treating wounded now being practiced it would be better to let the men die rather than to allow them to recover and continue life the cripples they would be under usual conditions.

IT IS stated in Vatican circles that the Pope's impartial attitude toward official Germany is undergoing a change. The Pope is reported to regret greatly the action of Germany in connection with the deported Belgians. The new attitude appears to have been adopted after the fall of Dr. von Bethmann-Hollweg, the former Imperial Chancellor, who, just before his resignation, wrote what now is apparent was a farewell letter to the Pope, thanking him for his forbearance and favors and calling attention to the fact that the Chancellor had always tried his best to grant the Pope's demands regarding prisoners. Although an absolute break with Germany is not expected at this time it is certain that the Belgian deportations are daily making more difficult the maintenance of relations. The Pope's personal position is also uncomfortable owing to the fight made by Anglo-French and Belgian Catholics, who long have claimed that the Pope was surrounded by German and Austrian influences.

Why You Want the Mueller Pipeless

THERE'S a lot of difference between "Mueller Pipeless" and just "pipeless". The Mueller Pipeless Furnace is a *real* furnace, of exactly the same construction as the old reliable Mueller line, only without pipes or flues. It is the result of 60 years' experience in the building of heating systems of all kinds, and it has behind it the Mueller name and reputation.

MUELLER PIPELESS FURNACE

LAST winter's unusual cold gave the Mueller Pipeless Furnace a severe test—a test which effectually proved the entire success of the system. Many good-sized houses were kept warm and comfortable in the coldest parts of the country and in the most exposed locations, with the thermometer at 20 and 30 degrees below zero for days at a time.

Interesting Book About Pipeless Heating—*Free*

You should know all about this new and improved method of heating homes. Just tear the corner of this advertisement, write your name and address on the margin and mail to us for interesting, illustrated booklet about pipeless heating, with name of nearest dealer who can tell you all about the Mueller Pipeless.

The Mueller Pipeless Furnace is easily installed. No tearing up of walls for pipes or flues. Just the thing for small or partial cellars—even where there is no cellar it is an easy matter to dig a pit big enough. Does not heat the cellar, preventing storage of fruits and vegetables. Saves 35% in fuel—burns hard or soft coal, coke or wood

The Mueller Pipeless Furnace will heat all the rooms in your house at a comfortable temperature, from one register, without pipes or flues, providing a continual circulation of warm air through all the rooms and insuring perfect ventilation.

Just leave the doors between rooms open and Nature's laws do the rest. The warm air rises, displacing the cold air, which is drawn into the furnace to be reheated.

With this continual circulation of air, your home will be kept warmer, more healthful, more comfortable—and at smaller expense.

The entire furnace is of solid cast iron, radiator is one piece, grates are of triangular duplex pattern, ash pit is large and high, double jacket is rust-proof. The Mueller Pipeless burns hard or soft coal, coke or wood—effects a saving of 35% in fuel.

With the Mueller Pipeless Furnace you are freed from the disagreeable job of putting up the stoves every fall and taking them down every spring—from lugging in coal to each stove and carrying out ashes. Your house is clean, with no room taken up by unsightly stoves. Your heating plant is in the cellar, where it belongs, and where it stays the year 'round.

The L. J. Mueller Furnace Company has on file thousands of letters from persons who have passed through several winters with Mueller Pipeless Furnaces and who tell of the greater comfort, convenience and economy they have given.

The Wisconsin Farmer

THURSDAY, AUGUST 16, 1917.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

SAVED FROM THE CITY.

A FEW weeks ago I told the story of the young man who had gone away from the farm to the city, full of hope and promise, and how he returned to the old home, in a pine box, to be carried to his last resting place by strange hands. I gave the story as it actually happened, only adding the moral that the boy who is tempted to leave the old farm and seek a home among strangers might well pause to think of the friends he is giving up and the danger he runs of living his days, and long nights, in a back-hall bedroom, not knowing the person in the next room. Perhaps it might not be amiss to reprint my summing up of the story:

What the country gives to the city and what it all too often gets back are the two extremes of life and health, happiness and good intentions. Wherever a man's heart is, wherever his friends are, wherever his home has been when he was happiest, there should he see to it that death finds him, rather than in strange places, among those who know him not and care nothing for him. Remember this, when the lure of the city enters your veins, for there are things far more worth striving for and possessing than worldly riches and a place in the busy world, which all too soon forgets.

My reason for printing these words again is to recall the subject to your minds so that you will understand (and appreciate, as I do) this letter from a Wisconsin farm mother. It is one of the finest testimonials to my work in this heart-to-heart council of ours that I have ever received. Let me print it in full:

Dear Mr. Pierce:—I am a busy mother and don't have much time to read, but I always take time to read your articles. The one about boys leaving the farm and going to the city and the return of the one in the cheap box came at just the right time to be a big help to me.

We have seven boys and the oldest will be nineteen in July. He has a cousin the same age who went to the city last fall. He is an only son and his father needs him on the farm, but he thinks he can have a better time in the city. He came home to spend Easter with his people and he got our oldest boy wild to go with him back to the city. We need him so much because he works the farm while his father and brother sixteen years old work at carpenter work all summer trying to get the cows, horses and farm machinery paid for. We only started farming three years ago and there is so much to buy, and it costs so much to keep a big family fed and clothed. The boy wanted to go and thought we didn't need him. I talked to him a little and then read him your piece and said, "That is true, Grant, every word." After that he went on with his work and chores and has not said a word about the city since.

Thanking you so much for that piece, I am your friend trying to raise some good farmers.

I thank the kind Providence which endowed me with the ability to write, and gave me such a splendid reading circle, for this opportunity to keep at least one farm boy from being lured to the city, with its pitfalls and dangers, its vices and temptations. Sometimes I wonder if what I write is doing any good, after all. Then a letter, such as this, comes to me and I am inspired to keep on, buoyed up by the thought that two or three among the hundreds of thousands who read my words may be benefited and thus it is all worth while.

IN DAYS LONG GONE BY.

I HAVE always maintained that the most interesting story in the world is the personal narrative of the man who has succeeded, whether he be farmer or merchant, doctor or mechanic. Of course, I prefer the story of the man who has grubbed success out of the soil, who has undergone hardships on a homestead, or has turned an abandoned farm into a money-making institution, or has fought his way up in the cornfield or feed lot until he stands out prominently as one of the leading farmers or stockmen of his community.

I propose to print such stories every little while. I find them inspiring and I believe most of my readers do, also. Whether we have life ahead of us or behind us, we cannot but be thrilled by the story of men who have won success on the farm. If we are young, it is an inspiration; if we are old, it is a recollection. Such a story is the one which Mr. S. S. Spangler, of Milan, Missouri, a valued subscriber, has to tell this week, in this fashion:

I am always much interested in your page, but recently it has seemed rather more interesting than usual, if possible. Your writings seem more like a private talk with one's own family or very close friend. Your career is another case of building better than you know. These letters of success have caused my mind to wander back to my boyhood days when I was a mere lad, not yet in my teens, being a member of a rather large family, living on a little rough farm in the grain belt. The struggle for existence was a rather stony trail. It seems about the steepest place in the trail was when I was about nine years old and my oldest brother thirteen. The brother between us became an invalid and my father's time was all, or nearly all, taken up with his care, and the burden of farm work fell to us boys. How well do I remember that raising corn and selling it was the order of the day and 16 to 20 cents was the market price, delivered. Oh, yes, we had a span of old gray mares to do farm duty, and, as a side issue, we raised a pair of colts as well, to be marketed usually at weaning time to help along with the revenue and pay interest on the purchase price of one of these mares that was still unpaid. Well, hauling corn in the fall was a part of our routine work, with the old mares with a linch-pin wagon with a homemade elm box. Sometimes when we were to be in town noon time we were allowed 10 cents to buy crackers and cheese to stave off our hunger. The price of a hotel meal was out of the question. But this was not so bad as to be chided about our team and outfit. One of the worst chagrins of all was to tie our poor team by the side of some of our more prosperous neighbors' big, fat teams hitched to a painted thimble-skein wagon that was just then coming into use. It was then and there I made up my mind that when I became a man I would own as good horses as anybody, and I pass it up whether I have made good the vow or not.

It was in 1877 that father decided to try his fortune in the West and to my mind it was the right move under the circumstances. The following year I worked four months and three days for $41 and at the day of settlement I took my employer's note for the pay, drawing 10 per cent interest. I then secured a place gathering corn and feeding 100 cattle at 40 cents per day. After I had held this job two or three weeks one evening after supper my employer asked me to come to his private room, which I did on tiptoe and trembling, for I was sure I was to be dismissed for some possible misunderstanding of my work, for I was the kid among five or six other hired men. But to my great surprise my employer greeted me kindly and informed me I was to have my wages raised. You may imagine my surprise and I left that room with a firmer determination to do my best. Since those early trying days I have employed a good many boys and men myself and it has always been my pleasure to see as many as possible become landlords themselves and there have been more than a few who have reached the goal.

I think it was Robert Louis Stevenson (one of my favorite writers) who said that the most interesting story in the world is the story of the man next door. We could easily paraphrase it to read "the man on the next farm." Why go abroad and ramble through castle halls and hobnob with royalty when there is so much romance in the life of the man we pass on the country road or talk with across the dividing fence? There is more inspiration in the life of such a man than in the lives of hundreds of the conventional, artificial rich and noble. Give me the story of the man who has shouldered a shovel or pitchfork, who has walked in the moist furrow, who has "done his bit" to wrest a living from Mother Nature, and I am well content to let the city stories, with their false glamor and artificiality, go by.

A GOOD DEED.

I DO not intend this article as a defense of, or an apology for, the railroads or any other large corporations. I am printing it because I find pleasure in recording instances of big-hearted generosity whenever and wherever they may be found. There is so much that is sordid and mean in the world, we should lose no opportunity to chronicle and discuss the instances where the milk of human kindness nourishes the cockles of the heart.

I believe this incident proves that there is a new spirit manifest in many business circles today; a spirit which realizes that there is something more to business than the gathering together and the hoarding of many dollars; a spirit which takes cognizance of the worth of the humblest man. But I do not need to make much comment; the story speaks for itself. Here it is, as a subscriber sends it to me:

Fred Falley was a farmer living three miles west of Topeka, adjoining the Union Pacific railroad. He started last month with his wife and three-year-old son in a motor truck to take a load of vegetables to town. Although the engine was whistling and the bell was ringing so other travelers on the highway heard and stopped, Falley drove directly in front of a Union Pacific train. He and his wife and son were killed and the truck destroyed.

They left a family of six children, ranging from the oldest daughter, Vera, to a baby eighteen months old. Their little farm had a mortgage of $2,299 against it. Teams and implements were mortgaged for $500 and the truck struck by the engine had recently been purchased for $825.

The daughter, Vera, and her fifteen-year-old brother decided to keep the family together and to continue to operate the farm. Neighbors promised to help them. They did raise about $500 and then a storm struck the neighborhood.

R. W. Blair, general attorney for the road at Topeka, had an investigation made, but when the coroner's jury found the railroad without blame he considered the matter closed. Then he learned of the plight of the six fatherless and motherless children and told E. E. Calvin, president of the road.

Calvin at once dictated a letter ordering the two mortgages on the Falley farm lifted, a new motor truck purchased and the funeral expenses of the children's father, mother and brother paid. The check just sent amounts to $3,764.

A few years ago, under the old "public be d——d" attitude assumed by many of our large railroad men and corporation officials, such an incident would have been impossible. There is an old Persian proverb to the effect that the "cheapest thing in the kingdom is that which men hold most dear:" their lives. That proverb is becoming less applicable in America every year. We are in the midst of war, which is exacting a frightful toll of human life; yet never was life held in such high esteem, never were we all striving to save life to such an extent.

I will not go so far as to say that there are not railroads and other big corporations which would not take political and economic advantage of the farmer if they had the chance. I am not saying that we should abandon our suspicious attitude altogether, in considering their pleas and demands. But I am saying that it does one good, in this heated season, to read and to reflect on such a story as I print herewith. Out on the farm we look at things in a larger way than they do in the city. We have a better chance to see the good there is in people, deep covered though it may be by conventionality, artificiality and assumed gruffness. Let us look at incidents such as this and reflect that the world is getting better after all, that charity is still in our midst, that the neighborly spirit is still manifest even in the hearts of the busiest and the gruffest and that there is a brotherhood between the farmer and the city man which is growing stronger and more enduring every day.

COLLEGES AND SUCCESS.

MY RECENT article on the value of a college education—rather, that a college education is not an absolute necessity to success—has brought a host of letters. Most of the writers seem to hold the same opinion that I do, namely, that while a college education is valuable and greatly to be desired, if the means are forthcoming, no young man (whether he aspire to be farmer or to follow some city occupation) need give up hope because college doors are closed to him.

One of the most interesting of the many letters received comes to me from Mr. M. Gorges, of Colwich, Kan., who opens up the question of whether or not our state agricultural colleges educate the boys and girls away from the farm. I shall print Mr. Gorges' letter exactly as it came to me:

Allow me to say that your editorials in the past have put the hope into me that some day people of this country will wake up to the fact that theories and possibilities do not count at the end, but actual results. Your article "Education and the Farmer" ought to be passed over the entire country. A college education will undoubtedly benefit the young man that uses it on the farm in connection with observation, but without this it is worse than useless. We have no statistics to prove what the college education does for the good of the farming interests and must, therefore, be guided by our observations. I personally know nine young men who graduated at Manhattan, Kan. Of these there is one that remained on the farm. Of the forty or fifty other farm boys that graduated at other colleges not a single one ever returned to the farm. Now when we consider that the farm is being deprived of its help at an alarming rate we should try and keep those boys who fail to show a natural tact or inclination for something else on the farm. If the farm land in Kansas today would have to be tilled as it should be one-third of it would grow up in weeds for the want of efficient farm help.

Those of my readers who have positive data on this subject will confer a great favor on me by writing and sharing their knowledge with us. Are the agricultural colleges making better farmers, or fewer farmers? There are two sides to every question; let us have this one discussed, pro and con, not merely giving our personal opinions, but backing these opinions up with information and reports. What boys and girls in your neighborhood have been educated away from the farm by the agricultural college; what boys and girls have been returned to the farm better able to carry on the work? Will you share your information with me, so that we can discuss the matter intelligently and accurately?

THE WISCONSIN FARMER, Madison, Wisconsin

Money Value of Manure.

A comparatively small percentage of farmers are in a position to purchase farmyard manure so that it may not seem to be an important matter to know just what is the actual cash value of manure. However, it is interesting from another standpoint because more or less manure is produced on every farm. The Missouri station has been working on this problem for many years and some very interesting results have been gathered.

Beginning about ten years ago this station began applying eight tons of manure per acre to soils in different parts of the state. In every instance the manure was plowed under in preparing ground for corn. The corn was followed by oats and this in turn followed by wheat and this crop was seeded down. None of the crops that followed corn received any manure or any fertility. Land receiving this kind of treatment produced ten and one-half bushels more corn per acre, five and one-half bushels more wheat, four bushels more oats and about 7,000 pounds more hay than did similar land that received no manure.

With these increased returns in mind it is an easy matter to compute the actual cash value of the manure applied. The ten and one-half bushels of corn would be worth approximately $20 at the present time, while the value of the increase in the wheat would be nearly $12 and the oats $3. In addition, there is a very large increase in the amount of hay produced, so that on the basis of present values the eight tons per acre would increase the value of crops during the rotation period more than $50 per acre.

The conclusion to be drawn from these results is simply this, that every pound of manure that it is possible to save should be saved, because in these piping times with prices for farm products far above the average, every load of manure is actually worth $6 or $7.

The Wheat Situation.

While economy in foodstuffs and particularly wheat is being preached on all hands, it is hard to make any individual citizen feel his personal responsibility in the matter. The loaf of bread or two which he can save a week appears so pitifully small, like a raindrop in the ocean's depths, that it hardly seems worth while to make the effort. Yet the nation is only the individual citizen written large, and it is only by individual effort that any saving can be made.

A few figures may serve to bring home to our readers a little more clearly what not only the United States but the whole world is facing. For the most part the allies must depend on the United States and Canada for their wheat supplies. Russia and Roumania are out of consideration, so far as any great help is concerned, as a result of military conditions and internal dissensions. British India and Australia, with their long hauls, can help little, owing to the shortage of ocean tonnage as a result of the submarine menace. South America is more likely to be importing wheat rather than exporting it because of crop conditions. That leaves the matter principally up to North America.

In round figures the United States and Canada now have the prospect of about a billion bushels of wheat, of which this country's supply is composed of about 100 millions of "carry over" and 650 millions of this year's crop, while Canada has no "carry over" and only about 250 million bushels in prospect. The crop prospects might, of course, be further reduced by bad weather here and in Canada, but at present a billion bushels is a fair estimate of the total supply.

Now by the strictest economy North America may be able to get along this year on half a billion bushels for her own consumption. Then nearly 100 million bushels must be saved for seed and fully 50 million bushels for a safe "carry over." This leaves only 350 million bushels for export to Europe, which will have to take its chances with the submarines, by which it is likely to be further diminished. But even if every bushel of the 350 million that the United States and Canada may have to spare were to be safely landed in Europe it would still be scarcely more than half what is needed there. France, England and Italy alone, even by the most rigid economy, can hardly get along with less than half a billion bushels.

In other words, under the best of conditions the United States and Canada cannot supply more than 50 per cent of our allies' needs. Where and how to get the other 50 per cent is the problem which is troubling Mr. Hoover and his assistants at Washington. It is the patriotic duty of every citizen to make this task as light as possible. This can be done by substituting corn meal for wheat flour where possible, by eliminating all waste of bread in the kitchen and by keeping one's personal consumption within the minimum amount absolutely necessary. The women of the country are waking up to the situation and there is no doubt that they will do their part in this general economy. It is the men of both city and country whose appetites need curbing if the United States is to do its full share in supplying the world's bread basket.

The Farm Grain Elevators.

Present conditions point to a large crop of corn this fall and consequently to the need of considerable additional crib room. Suppose you have a good crib, but that it is only about half large enough to house this year's corn. By simply making the old crib about twice as high as it is now the cost of enlarging would be nominal. The only thing necessary would be to raise the roof, put in enough additional studding and outside wall and the job would be completed. Of course, you could not fill such a crib with the scoop, but an elevator and dump would do the job and save you a lot of labor.

The saving in the cost of the crib construction, together with a saving of half a cent a bushel for husking, will go a long ways toward paying for an elevator and dump. Once you have the elevator on the place you will find many uses for it besides unloading corn. It will run your small grain into the granary, put your shelled corn up into a high bin from which the corn will run down into the wagon when you are ready to sell or feed it.

The dump and elevator is one of the many useful inventions that are helping to make the farmer more and more independent of high-priced hired help. The old style corncribs and granaries are out of date today and should not be built. They are too costly per bushel capacity. The foundation, floor and roof, particularly in the case of a crib, are expensive compared with the framework and they cost no more for a crib twenty feet high than for one with half that elevation.

It is getting so nowadays that huskers are not very fond of shoveling corn into a crib; they consider it a back-breaking job and prefer to husk for men who own elevators at a lower price per bushel. They would rather spend an hour a day in the field husking than to put that time in at shoveling. Picking ears in the field is easier work than shoveling them into a crib with a scoop.

There are other advantages accruing from the use of an elevator and dump, one of which is the opportunity it offers for selecting seed ears as the corn passes up the elevator. While this is not the best way to select seed, the fact remains that fully 90 per cent of the farmers do not gather their seed till husking time and when selection is thus deferred the elevator offers an excellent opportunity to pick out the best ears from the whole crop.

Nearly every farm is now provided with a small gasoline engine, so there would be no extra expense for power in installing an elevator. Even if a small engine had to be purchased it can be used for so many things, such as pumping water, cutting wood, running the washing machine, cream separator, etc., that its cost need not all be charged against the corncrib.

Selling Grain or Feeding Live Stock.

There is at the present time a wide discrepancy between grain prices and live stock values. Every pound of pork made with corn at its present value will be sold at a loss, and cattle that are being finished on grain will net the owner a loss also. Recently our attention was called to an instance where a stockman who had not sold a bushel of grain for forty years had marketed 10,000 bushels of corn at $2.10 per bushel, his reason for this being that the corn could not be fed to live stock without involving him in a heavy loss. The Ohio station has just published a review of an experiment conducted ten years ago in which the cost of gains made on fattening steers is computed on the basis of their present values. It cost $22.11 to produce 100 pounds of gain when steers were fed on ensilage valued at $6.25 and corn at $1.40 per bushel. These steers did not net more than $11.50 per hundred, so that buying corn and feeding on the basis of these prices would lead to bankruptcy.

We do not like to contemplate this situation, because in the end it will be most disastrous if it should result in any marked cutting down in the numbers of our cattle, sheep or hogs. We need live stock to make a balanced agriculture and possibly before a twelve-month period rolls around grain and live stock prices will be on a par. Looking ahead for a five or ten-year period, it must inevitably be brought about that the live stock feeder or breeder who maintains the soil at a point of maximum production and who rotates grain crops sensibly with meadows and pastures is bound to be at the head of the game. While grain is at its present high level special effort should be made to utilize every pound of roughage that is produced. In other words, cut down the amount of grain fed and supplement with cheap materials. Keep the breeding herd intact, because the pendulum will swing the other way and in due time meat products will be relatively high as compared with grain.

If a sensible program is carried out this fall there will be more corn fodder shocked than ever before and with the new silos that have gone up this year there will be a big acreage converted into ensilage. It would be safe to predict that there will be a satisfactory market for well-cured baled shredded fodder and the farm revenue could be added to in thousands of instances by putting into the shock a considerable area at the proper time in the fall and shredding it after it has become dry.

Pleasure riding in motor cars should be curtailed to economize in the use of gasoline. That is the warning sent out to the country by the petroleum committee of the Council of National Defense, stating that the nation faces a gasoline shortage. What made the statement of unusual significance was the fact that A. C. Bedford, head of the Standard Oil Company, is chairman of this committee. In telling of the oil and gasoline shortage the statement says: "In view of the abnormal conditions confronting the nation by reason of the war, it is peculiarly important that the country should understand the serious situation now prevailing in the petroleum industry. This country is producing crude oil at the rate of about 300,000,000 barrels a year, but it is using it at the rate of 335,000,000 barrels a year. The amount of crude oil in storage, all grades, May 1, 1917, was 165,688,797 barrels. The country is absorbing the entire current production and drawing very rapidly upon its reserve supplies."

The annual meeting and picnic of the Ozaukee County Breeders' Association will be held at Falls Park, Grafton, on Sunday, August 26th. The meeting is being held this year on Sunday on account of the fact that farmers are short of help and cannot afford to give up any other day.

"ALFALFA" GRABER---LIME EVANGELIST

Wisconsin Farmer Editor Spent a Busy, But Very Profitable, Day With Emergency Food Agent in Green County.

A DAY with "Alfalfa" Graber in Green county, Wisconsin, is work for the visitor and pleasure for L. F. Graber, Green county emergency food agent. When in May this year the college of agriculture at Madison began placing emergency food agents throughout the state Professor Graber was offered and accepted with joy the position of food emergency agent for Green county, the biggest alfalfa county in the state. There are 28,000 acres of alfalfa in Green county, and at least 28,000 answers on alfalfa stored away in Mr. Graber. Having made alfalfa his particular study for many years, nothing could suit Mr. Graber better than going to Green county and working over the troubles and learning more about the peculiarities of alfalfa growing.

SWEET CLOVER ALONG THE WAYSIDE IS AN INDICATION OF ALFALFA SOIL.

CRUSHED LIMESTONE ON ARTHUR PRESTON FARM, NEAR JUDA, GREEN COUNTY, WIS.

The study of alfalfa has brought Mr. Graber into close company with limestone and its use as a fertilizer. He is firmly convinced that the day is not far distant when limestone will be applied to the farms as regularly as manure. Ninety per cent of the difficulties of alfalfa raising in Green county are due to a need of lime in the soil and keeping the stand by having Grimm alfalfa instead of the common variety and because there is yet no definite understanding of how late alfalfa can be cut and survive the winter. Alfalfa should not be cut later than the first of September, and it should not be pastured if it is desired to maintain a stand. Where plenty of lime is used on the soils that are sour and the hardy Grimm variety is sown a stand of alfalfa has every chance of living from four to seven years and yielding heavily each year.

We learned all this as we were starting out on our trip and passing various fields of alfalfa, some poor, some good. The first farm visited was Frank Burt's, near Albany. Here Mr. Graber showed us the first proof of the effect of lime on corn. Mr. Burt planted a strip of alfalfa on lime soil three years ago and compared it with some alfalfa on unlimed soil. Good results were obtained from the alfalfa that was limed, but the unlimed part of the field proved an utter failure and in order to have the use of the land this strip located right in the center of a large field was plowed under with the poor stand. There has been corn on this large field for two years, and this year again the portion which had been limed shows up so well that a person unacquainted with the field can tell to the row where the lime was applied and where no lime was used. The illustration shows the difference in size of the stalks. The stalks were selected with great care. An average-size stalk was taken from the limed and unlimed portions. A very conservative estimate would place this increase in yield of corn alone at from fifteen to twenty bushels more per acre, due directly to the application of lime.

After looking over Mr. Burt's excellent crop of young Duroc Jersey hogs we visited the farm of E. E. Brewer, of Albany. Mr. Brewer wanted to know what caused the poor stand of alfalfa in one of his fields. So the litmus test was applied to the soil, but as the soil did not show acid it was discovered after a little questioning that part of the field had winterkilled the year before and the answer was: "Sow more Grimm alfalfa."

E. E. HAVERMAN'S BARN, GREEN COUNTY, WIS. SILOS ARE MANY AND LARGE IN GREEN COUNTY.

Mr. Brewer has a good herd of grade and pure-bred Holsteins with the pure breds in the majority.

Milk production is the chief source of revenue for most Green county farmers, and the pure-bred sire is coming more and more into his own every year. However, most of the dairy stock is still grade stuff, and very few herds have a bigger per cent of pure breds than grades. Cow-testing associations are also not numerous in Green county. The only testing association up and coming is the Monticello Cow-Testing Association. Associations in general are very few in the county. There are no breed associations or farmers' clubs as in other counties. The cheesemakers' and dairymen's association, milk producers' association and the cow-testing association are really the only farmer organizations in the county.

Fred Dettweiler showed us an excellent stand of Grimm alfalfa standing alongside of a poorer stand of common alfalfa. The difference between the Grimm and the common alfalfa is not in its yield or in its growing qualities, but merely in the wintering habits of the Grimm. The Grimm begins to hibernate earlier than the common varieties. A common sight in the fall is the activity of an alfalfa field just before the cold weather sets in. With the common variety this is a usual occurrence. This extra growth which the common varieties make in the last few weeks of warm weather render them more susceptible to the first frosts of the winter. With the Grimm variety it is more likely that the plants will not show much growth after the last cutting. It is like the fruit tree that buds and then is caught by the frost, suffering injury which requires several seasons from which to recover. The Grimm variety is not in danger of this in the same measure.

Mr. Graber never fails to preach the value of lime. Green county is so rich in limestone that it is hard for one to understand why the soil in any locality should become sour. However, the lime evangelist, as he is being known, points out that many years of cropping, and especially grain farming, have depleted the lime content of the first six inches of soil until there is no more calcium left in the top layer which is available for plant growth. On the average three tons of lime will correct the acidity of the soil. Lime, as a rule, does not show up the first year. The second year when alfalfa makes its most rapid growth is the year when it needs lime badly. One ton of alfalfa takes from the soil 100 pounds of lime. That is the reason it is all the more necessary for lime to be applied abundantly. That is also the reason why on sour soils alfalfa which showed a good stand with the nurse crop will in the second year of its growth, which is really the first year that it produces hay, get what Mr. Graber calls the yellow jaundice. The limestone required by the growing alfalfa is not present in the soil. The roots of the alfalfa have not penetrated deeply enough into the subsoil to avail themselves of the lime contained in the lower layers of the soil. But even though alfalfa will stand the second year and be abundantly supplied with lime it cannot be expected to pass the winter safely when the crop is cut too late in the season. It also cannot be expected to pass the winter as well if the seed used has been of the common variety instead of the hardy variety.

On the farm of Mr. Dettweiler we also saw the difference between the Turkestan variety and the common alfalfa. Two fields sown three years ago side by side show that the Turkestan is also a hardy variety in spite of the fact that the United States Department of Agriculture has repeatedly warned the farmers against using this seed. The Turkestan also has the characteristic of not making a very large growth after the last cutting. The common variety growing right next to it on Mr. Dettweiler's farm has made an excessive growth after the last cutting and froze out the following winter, while the Turkestan variety today shows an excellent stand and is yielding heavily.

Most of the farmers in Green county are abundantly supplied with lime

FRANK BURT FOUND STALKS FROM LIMED GROUND HAD TEN INCHES THE BEST OF IT.

ANOTHER SAMPLE OF STALKS FROM LIMED AND UNLIMED SOIL.

OIL BANKING

How shrewd motorists save money

WHEN most car owners were novices, strong words made strong impressions.

But today the roads are toured by millions of veterans. These veterans have learned how to test words. They know how to prove or disprove claims.

If you are a veteran you know this: An oil that burns up rapidly or breaks down quickly cannot be really cheap. Though it may be low-priced by the gallon, it is bound to prove high-priced by the mile.

You know that a wrong-bodied oil raises your gas consumption. Instead of saving your oil pennies it eats up your gas dollars.

You know that wear and tear on the metal parts means, some day, a heavy bill which the low price per-gallon can never wipe out.

In recent years no oils have made such steady progress toward a dominant place in the market as Gargoyle Mobiloils.

Why?

Because now-a-days the great bulk of lubricating oil is sold to automobile veterans—men who have learned that gasoline saving depends largely on thorough piston-ring seal—who know that the piston-ring seal depends solely on the *body and character* of their lubricating oil.

Because the veteran knows that an oil which uses up rapidly is not lubricating properly.

Because the veteran automobilists of today know that the higher price per gallon of Gargoyle Mobiloils means a lower cost per mile in operating expense.

Write for new 56-page booklet containing complete discussion of your lubrication problems, list of troubles with remedies and Complete Charts of Recommendations for Automobiles, Motorcycles, Tractors and Marine Engines.

GARGOYLE

Mobiloils

A grade for each type of motor

In buying Gargoyle Mobiloils from your dealer, it is safest to purchase in original packages. Look for the red Gargoyle on the container. If the dealer has not the grade specified for your car, he can easily secure it for you.

CORRECT AUTOMOBILE LUBRICATION

Explanation: The four grades of Gargoyle Mobiloils, for gasoline motor lubrication, purified to remove free carbon, are:

Gargoyle Mobiloil "A" **Gargoyle Mobiloil "E"**
Gargoyle Mobiloil "B" **Gargoyle Mobiloil "Arctic"**

In the Chart below, the letter opposite the car indicates the grade of Gargoyle Mobiloils that should be used. For example, "A" means Gargoyle Mobiloil "A," "Arc" means Gargoyle Mobiloil "Arctic," etc. The recommendations cover all models of both pleasure and commercial vehicles unless otherwise noted.

This Chart is compiled by the Vacuum Oil Company's Board of Engineers and represents our professional advice on Correct Automobile Lubrication.

stone of a very high test. Arthur Preston, near Juda, has on his farm limestone testing 98 per cent pure. He intends to apply 200 tons during the coming year on his fields. Eight other men of the neighborhood are going together and will crush during the coming months all the lime necessary for their fields. The charge for this limestone will be limited to the cost of running the crusher, which is being lent to them free of charge.

Charles Kohli, of Monroe, had on the day we were there a carload of air-slaked lime which he was going to put on his fields. This carload is one of many due to Mr. Graber's urging for more lime on every sour acre in Green county.

There comes a time of night, however, when it is no longer polite to call on people, and that is the time when "Alfalfa" Graber, lime evangelist, considers quitting time, does a few more hours' work at the office and calls it a day. We were glad he did: We would hate to follow him for a month.

Waukesha Holstein Breeders

Hold Great Summer Picnic at the Fred Pabst Farm, Near Oconomowoc, August 2d.

THEY are always doing something new in Waukesha county, or, if they can't find something new, they do the old thing in a bigger way than it has ever been done before anywhere else. This time it was the summer picnic of the Waukesha county Holstein breeders held at Pabst Stock Farm at Oconomowoc on August 2d.

ON THE BEAUTIFUL GROUNDS OF MR. PABST'S ESTATE THE CROWD FOUND SHADE AND COMFORT.

It was the biggest and best-natured crowd of county breeders and their families that we have ever seen congregate in honor of the Holstein cow. Starting with the trip over the Pabst farm in the morning and ending up with the sale of the Red Cross calves donated by the association for this purpose the day was an unqualified success. The beautiful grounds of Mr. Pabst's home were turned into a picnic place for the 1,500 or more visitors. Between 500 and 600 automobiles were parked on the grounds. All day long the chefs were busy supplying the hungry crowd with things to eat and the refreshment stand had a never-ending stream of thirsty ones to supply. And it was all free.

PROF. A. C. OOSTERHUIS GIVING A COW DEMONSTRATION AND LECTURE.

Following the noon meal Prof. A. C. Oosterhuis, of the college of agriculture, gave a cow demonstration, emphasizing the milk-producing characteristics of the true Holstein cow. Wm. Moscrip, of Lake Elmo, Minn., had been scheduled for this, but, as he was unable to appear, Mr. Oosterhuis was called upon, and proved a very able substitute.

The main speaker of the day was Mr. Hugh G. Van Pelt, of Kimball's Dairy Farmer, Waterloo, Iowa, whose

[illegible] IS LISTENING TO FEEDING TALK AT WAUKESHA COUNTY HOLSTEIN PICNIC.

talk on "How to Feed the Dairy Cow" was listened to with more than ordinary interest. Mr. Van Pelt had a vital subject to talk upon, and the interest of the breeders was manifested in the close attention the speech received. According to the speaker, the essential part dairying is playing in the world has been proved more strongly than ever by the fact that since the war began the infant mortality among the warring nations not able to obtain a full supply of milk as in normal times has been appalling. Of all the babies born in Serbia since 1914, 90 per cent have died, due for the most part to a lack of milk. Lack of feedstuffs has caused many of the warring countries to slaughter the dairy cattle. Now these same countries admit that this was a serious mistake. The United States is doing a similar thing now in many of her dairy districts, and sooner or later government action will have to be taken in order to prevent disaster. Thirty per cent of the dairy cattle in the New England states are reported to have been slaughtered within the last five months. Twenty per cent of the milk cows in the corn belt have likewise been consigned to the shambles. To a certain extent this amount represents unprofitable cows, but beyond a certain limit it will mean more than merely getting rid of unprofitable producers. There is danger of much of our good dairy stock being slaughtered for beef simply because high prices at the stockyards, together with high prices for feeds at home, are making small dairymen forget the grave times we are living in.

"Utilize all feed and keep books on every cow by weighing her milk and weighing her feed out to her," are rules which the dairymen of today cannot overlook. As Americans we are wasteful in our methods of feeding, according to Mr. Van Pelt. We would rather be careless than bother about an extra few pounds of milk or conserving a few pounds of feed. However, a little loss in milk flow from every cow and a waste of several pounds of feed each day represent a big loss in the aggregate. We are careless with the sires we use, careless with the feeds and careless in securing results from such feeding.

The greatest lessons of all times can be learned from the cow herself. "Take one cow and feed her for one year as she should be fed," advised Mr. Van Pelt. "Study her closely and in twelve months' time any man with an average mind can learn how to care for a herd in the proper manner. Starting with a cow that is about to freshen, her owner should give her from six to eight weeks of good care before calving, during which time she should be dry. It is easier to keep a cow in good condition than to get her into condition. Bran and ground oats make an excellent feed, together with linseed meal, for bringing the cow into proper shape to deliver her calf and start her lactation period properly. After freshening just because a cow gives large amounts of milk is no reason why she should be overfed. Gradually her feed should be increased in proportion to her yield and the cow taught to consume more and produce more. Increasing the grain ration a half pound every other day until the maximum is reached and then slowly decreasing the feed in case the cow is being fed too heavily at the same rate of one-half pound every other day will work wonders in increasing production and decreasing feed costs. All changes, however, in the feeding of a cow should be gradually made.

"Unless you weigh feed and milk you have no business to be in the dairy game in these days of high feed and close figuring," said Mr. Van Pelt. "Weighing the feed does not require the same amount of labor and attention that feeding the entire herd from several bins and by guess does. A feed sheet made out by the herdsman or the owner of the dairy can be followed by any boy or man able to read figures. The feed box on a shelf overhead of the cow enables the milker or anyone around the barn to feed the cows quickly by giving half of the weighed ration at night and the last half in the morning."

The summer silo and commercial feeds are coming into their own, according to Mr. Van Pelt. There was a time when the winter silo was looked upon as essential, but today the summer silo has become fully as important. It is in the summertime when most herds are neglected and underfed because they are "supposed to be on pasture." Big returns from increased production are always forthcoming where summer silage is fed in addition to the pasture at hand. Utilizing waste feeds, as cornstalks not put into the silo, was also advocated by Mr. Van Pelt. By soaking the cut stalks in scalding water and molasses overnight the cornstalks will make a palatable feed and help reduce the cost of roughage in the dairy. "Fortunate is the man who has a winter silo, more fortunate the man who has both, but unfortunate, indeed, is the man who has no silo to conserve his corn crop this winter, and attempts to feed dairy cows without silage."

Following Mr. Van Pelt's address Waukesha's new county agent, J. E. Stallard, was introduced to the breeders. Mr. Stallard, in a short address, thanked the breeders for the welcome that was accorded him and immediately got down to business by calling attention to the barley stripe which has been found in a great number of fields throughout the state this year. This disease, similar to the grain smuts, can be prevented by giving the seed the formalin treatment.

Two Red Cross calves were auctioned off by Mr. Love, and sold for $250 and $300, respectively. Brookvale Burke, an excellent heifer, went to Burton Smith, banker-farmer, of North Lake, for $300. This calf was from the herd of Mr. Dave Howell, and her mother sold at the Waukesha sale for $500. The other, a bull calf from the herd of H. E. Reddelin, of Oconomowoc, was equally well bred and a splendid individual. It went to E. J. Goetsch & Sons, of Watertown, for $250. The bidding was lively, and Mr. Love made the best of it. Both calves were given for this purpose by the Waukesha County Holstein Breeders' Association, and the funds will all go for the Red Cross work and be credited as a donation from the Waukesha breeders.

A band engaged by the Oconomowoc business men for the occasion played from morning until night. It was a great picnic and the Waukesha breeders and their secretary, W. L. Baird, and Mr. Pabst are entitled to a vote of thanks.

The Hillsdale Cheese Factory, in Barron county, was organized only a few years ago with twelve patrons and a very modest output. They bought cheese boxes a few at a time, but now they are buying them in carload lots. The second week in July this factory shipped as its product for one week 9,200 pounds of cheese, for which a check for $1,985.12 was received. The factory receives about 8,000 gallons of milk daily.

A strong argument against allowing manure to accumulate around the barn is that it becomes a breeding place for flies, which spread disease germs.

Here's a Still Better Willard

Every part of your electrical system must be made leak proof by *insulation*.

Inside your battery is the most important insulation of all—that which separates the positive from the negative plates, for this prevents the battery from "short circuiting," and thus putting the whole system out of commission.

In the Still Better Willard, the insulation is made of durable, acid-resisting threaded rubber.

Thus Willard Threaded Rubber Insulation means a *better insulated* battery, a more durable, more efficient battery.

Write for the booklet H-8, "The Story of 196,000 Little Threads," and at the same time ask about the remarkable record that Still Better Willards have made on 35,000 cars.

Variations in Cream Tests.

There is probably no one thing in connection with commercial dairying which causes as much uneasiness among patrons as the variation of the test of cream sold to receiving stations and creameries. This variation may not only result in patrons being dissatisfied but also causes the buyer of the cream uneasiness in maintaining harmonious relations with the patrons.

The complaint of test variation often is on account of a patron not having a full understanding of the causes which affect the density and percentage of fat in cream. It is the policy of all reputable creameries that their employes be very careful to secure accurate results in sampling and testing. Unless the sample represents a fair average of the cream delivered the test, while correct of the sample, will not be a correct test of the cream delivered. The first requisite, therefore, for a correct test is an accurate sample.

It must be well understood by patrons who have observed the workings of the cream separator or who have tested the cream themselves with hand farm testers that there is a variation in the percentage of fat in the cream. A variation of from 5 to 8 per cent in test with no change in the cream screw is not at all unusual and this difference is chargeable to the varying condition of the machine from time to time. But I have known of instances where there was a variation of from 8 to 15 per cent, due to careless handling of the separator, milk or cream.

The variation of the speed of the bowl of the separator causes a difference of from 2 to 15 per cent in test of the cream, depending on the variation of the speed. The variation in steadiness of the bowl makes a wide difference, depending on the amount of vibration. The amount of flush water used makes a difference as great as 10 per cent in extreme cases and from 1 to 5 per cent in ordinary cases. The temperature of the milk makes a difference of from 1 to 5 per cent, greater variation being caused in extreme cases. Acid developed in the milk will have an effect on the density of the cream. This is not the case when separating is done at milking time, but when the night's milk is held until morning or vice versa, as is the case on some farms. As the separator bowl clogs the cream will gradually become thicker until the cream will not flow.

Another cause of variation in test is imperfect straining of the milk before separating. The milk should always be strained through a fine wire strainer into cans. Over the receiving can a piece of closely woven cotton cloth should be placed. For convenience this can be fastened with a strap around the can. This will catch all sediment and will give the separator clean milk. If the separator is fed unevenly or if at any time during the run the inlet should be clogged with dirt so that the bowl does not take the full inflow of the milk wide variations in test of cream must be expected.

Some users of separators may sometimes state that their cream screw has not been changed in years and that their cream ought to test now as it did years ago. The fact that the screw has not been changed is good reason why the test of the cream should not be the same as when the separator was new. With use the cream screw wears off and takes the cream farther from the center of the bowl and, therefore, produces a thinner cream. Thick cream is produced by drawing the cream from the center of the bowl and thin cream by drawing from a point nearer the outside.

If the bowl is not washed properly after each operation this will also affect the test. If the openings are not all clean and free from dirt the capacity is affected. The separator bowl removes substances which no system of straining will remove and if this matter is allowed to remain in the bowl even for an hour after finishing the run it is an ideal breeding place for millions of the worst kind of bacteria.

Under average farm conditions it is impractical to operate the separator in such a way as to secure an absolutely even density of cream, but every care should be used to obtain as even work as possible. The patron of a creamery can at little expense secure his own tester and its use will better satisfy him regarding the treatment he receives and also give him insight into many things of considerable worth. The man who knows the most about his business is always the best satisfied.

SANITATION

IS THE RELIABLE METHOD FOR PREVENTING

FOOT AND MOUTH DISEASE

HOG CHOLERA

AND OTHER CONTAGIOUS DISEASES.

You can make all live-stock quarters sanitary by using

KRESO DIP No. 1

The Standardized, Reliable Dip and Disinfectant.

KRESO DIP No. 1 has been used at the large state fairs in the United States for the last ten years to prevent the spread of contagious disease. It has done it, and KRESO DIP No. 1 will do the same for you on the farm.

KRESO DIP No. 1 is reliable. It is easy to use. It is inexpensive.

FOR SALE BY ALL DRUGGISTS.

We will send you free a booklet on the treatment of mange, eczema or pitch mange, arthritis, sore mouth, etc.

We will send you free a booklet on how to build a hog wallow, which will keep hogs clean and healthy.

We will send you free a booklet on how to protect your hogs from lice and parasites and disease.

Mission of the Cornstalk.

To the Editor:—Every year the man who is in the dairy business comes face to face with the problem of "getting through to grass." Sometimes this man of the dairy lives in one part of the country, sometimes in another. The country is so big that always somewhere there are those who feel the pinch of the failing haymow or the empty silo when it comes along toward spring.

This year is no exception to the general rule, except that the outlook is more universal than usual that many will have to be very economical of feed if they get their stock through to the early grass of 1918 in the best condition to do business for another year. Here is where the conservation of all possible cattle foodstuffs will play an important part.

The loss of feeding value in the United States through the medium of wasted corn fodder is a most serious one. Thousands of tons of good stalks lie on the ground and do little good. They make good fertilizer, it is true, but how much more worth while it would be to save them and feed them and then apply the droppings from the cattle which eat them to the land! Two great ways may be suggested of saving the cornstalk, so that it may fulfill its mission of helping to winter the stock of our farms. First, they may be shocked and left in the field to be drawn and fed as needed. To get the most good from stalks cared for this way it is my opinion that they should be cut up with a machine left on the floor or in big boxes until they begin to heat and soften. Little feeding value will then be lost. The cows like these stalks and by feeding some grain with them, supplemented by at least one ration a day of timothy or clover hay, we have a feed that brings the best of results.

The other way of preserving these stalks is to cut them into a silo. I doubt if all our farmers, even in this up-to-date period of dairy farming, fully appreciate the worth of the silo. Not yet have all come to know and understand that corn cut even after the ears have been husked and stored in a silo will come out a most delicious feed for dairy stock. Practically nothing is lost when we care for corn this way. We have the ears in the crib and the stalks in the silo, and every particle of the corn plant is saved and made to do its part in meeting the problem of the long winters of our northern climate. Well for us all when we do come to see how greatly worth while it is to build silos and store our corn in them. Dairy farming without a silo is not as easy as it might be. So my plea now is that every farmer who can should at once put up a silo and give the cornstalk a chance to fulfill its mission.

This Silo Filler Makes Alfalfa Chop

Write NOW For Wonderful New Smalley Book FREE

Learn how thousands of farmers are fattening hogs, cattle, sheep and poultry with alfalfa chop made quicker, easier, better than ever before! Learn how they're selling their Al hay, milling off-grades for feed—how they're making simply great combination feeds from clover, rice, straw, bean straw, pea vines, oats, rye and corn stalks—600 to 900 pounds per hour with Junior Mill and 6 to 8 horsepower engine. This mill cracks peas, corn or velvet beans.

Smalley Silo Filler (Seven Sizes)

Chain Drive — Force-Feed Grip Hooks

Grip hooks do the work of human hands. They catch the corn—automatically push it under the paddle roller and powerful, swift revolving, bevel edge knives set like a lawn mower do the rest. No grinding, no pounding. Turns out ensilage, clean-cut, fine, uniform, unbeatable in richness. Increases tonnage! Saves time, money! Two men's labor with large outfit!

Chain Drive forever does away with belt wear, belt slipping. That means power saved! Blower operates independently of knives. Let your fan spin fast or slow—speed of cutter shaft is unchanged—more power saved! A saving of 1-5 to 1-4 in power alone. Think of it! Two machines in one!

Get all the facts. You want an outfit—need one. Write NOW for sample of chop and FREE book, to

Cooling Milk on the Farm.

To the Editor:—If there were any way of figuring up the losses to the farmers of this country through spoiled milk it would astonish the most unresponsive of us. We know that now and then we have a can of milk go bad through heat. It touches us a little bit. We use the milk for the hogs or other stock, pass it along and forget it. But this is a big country. Such losses of high-priced milk and cream aggregate large, and almost always there need be no such loss at all.

On our own farm we have lately put in a cooling tank that serves a very good purpose. We had a milk house that we used a good many years ago when we made up our milk at home. Digging down in one end of this, having first taken up the board floor, we filled in with gravel and small stones till we had a good foundation. On the top of this we set up our forms of plain boards for the reservoirs we had in mind. The tank as it is now is about five inches thick, three feet deep and seven or eight feet long, the bottom being about a foot below the surface.

Through the middle of this tank, dividing it into two equal parts, is a partition, leaving the compartments about four feet in length and two and a half feet wide. Around the top of the cement sides we put a wooden strip wide enough to fully cover the cement and keep it from being chipped off when the cans are lifted over into the tank.

We might have it rigged so that water could be pumped into the tank, but so far the boys bring it in by hand. From the ice house on the other side of a partition through the house we get our ice when the weather is hot enough so that it is needed. As a rule, the water in our well close by the milk house stands at about forty-five in summertime, which serves to cool the milk down at most times of the year. There is room in each of the compartments to set four cans of milk, and a neighbor who helped us put the tank in brings his milk down to be cooled. We

worked together, also, in putting up the ice, lightening the work for us all round.

We have a conical tin device, with a long handle attached to the upper end and a number of holes in the cone part, for stirring the milk and getting the animal heat out. This long handled cooler, if I may call it so, helps very much about reducing the temperature of the milk. With an arrangement of the sort I have described it is almost impossible to have spoiled milk. It is our own fault if we do.

All who furnish milk either for the local creamery or for shipment to distant cities may have just as good a cooler as ours, and the expense is not great. Any farmer with thoughtful mind and willing to follow directions may do the work. E. L. V.

Cow-Testing Reports.

New Holstein Association.

To the Editor:—Our highest average goes to Rudolph Paulsen, whose herd of ten cows, composed of four grade Holsteins, four natives and two grade Durhams, averaged 1,289.4 pounds of milk and 44.3 pounds of butter fat. The banner cow for the month was a grade Guernsey, owned by H. J. Duecker. She produced 1,509.1 pounds of milk and 60.3 pounds of butter fat. F. H. Voland, a Holstein breeder, owns the champion milk cow, she producing 1,768 pounds in thirty days, which contained 58.3 pounds of butter fat. During June the price for butter fat at cheese factories ranged from 53 to 60 cents per pound, the condensery paying $2.50 per hundredweight for 4 per cent milk. Our forty-five-pound list for the month ending June 30th is as follows:

Owner, name and breed	Age	When fresh	Lbs. milk	Per cent of fat	Lbs. B. fat

Highest cow for month, Grade Jersey, Bert Kastein, owner: 1029 pounds milk; 5.6 test; 57.6 lbs. butter fat.

F. L. CUENOT, Official Tester.

How the American housewife can help win the war by making bread containing chiefly other ingredients than wheat flour is contained in a letter written to Mrs. Lon O. Hocker by Miss Josephine T. Berry, Mrs. Hocker's sister, says the St. Louis Globe Democrat. Miss Berry is dean of the home economics division of the University of Minnesota. Miss Berry's letter says that it is interesting work to discover or invent new breads for the purpose of saving wheat. "All of the mixtures save from 25 to 50 per cent of the wheat flour and this sort of thing must be done, for otherwise we can't ship any wheat abroad. If we can persuade our American people," continues the letter, "to use less wheat and more corn meal, rolled oats, rice and barley, and, in some places potatoes, we may somewhat broaden the diet and lessen our dependence upon wheat. You will find bread made with corn meal, with rolled oats and with rice especially delicious."

Kalamazoo
ALFALFA & ENSILAGE CUTTERS

Before you buy an ensilage cutter, find out all about the *Kalamazoo*—the *only* cutter on the market having a center shear. The Kalamazoo has an unbreakable malleable knife *wheel*—not a knife cylinder. Two knives are constantly cutting toward *center*—absolutely no side-thrust. No wasted power. This center-cutting knife wheel delivers a steady, even flow of ensilage to the blower—clogging is absolutely impossible. Another big feature—

The Knife Wheel is the Blower Fan

You can't realize what a power saving this means until you see a Kalamazoo in operation. All wearing parts are easily adjustable. Cutting adjustment is on shear bar only. This makes adjustment of knives simple and easy compared with other cutters.

Get a Kalamazoo—save power—save cutting cost—feed your herd on less acreage. "Do your bit" by helping produce America's biggest saleable crop.

Tractor Demonstration at Fremont, Neb.

(Continued from page 1.)

Thomas over the tractor. "As I see it," said the owner of this 440-acre farm, "there is but one thing to do and that is for me to get rid of some of my horses. I have sixteen head that I can put into the harness and, believe me, it takes some grain to carry them through the work season. When corn was worth from ½ cent to 1 cent a pound I never took a second thought when I dumped ten or twelve ears into the manger at a feed, but now that it is worth 4 cents a pound it seems like pure money. My big horses eat as much as eighteen and even twenty pounds of grain a day when they are at hard work and when I see these tractors plowing an acre of ground on two gallons or two and one-half gallons of kerosene I am convinced that the work is being done cheaper than I can do it with horses. It looks to me as if I could handle my land with one of these outfits and eight of my horses, because in that case I would have two four-horse hitches and four two-horse hitches during the corn cultivation season. When I am convinced that the tractor will last and not smash to pieces easily and not require expensive repairs then I am ready to invest."

THE TRACTOR PULLS BOTH DRILL AND HARROW WITH EASE.

The rain that fell early last week, which for a time was so depressing to the officials in charge, proved, after all, to be a blessing in disguise. It held up the work of plowing for a time, but with twenty-four hours soil drying the tractors were all again in the field. Those who have taken it upon themselves to fight the coming of the tractor have dwelt upon its helplessness in a wet soil, and true it is that the tractor tends to mire down on land that is saturated. Gradually, however, it has been demonstrated that there is little advantage in working a soil while it is in this condition, because it tends to pack it and greatly injure its physical texture. Where plowing is to be done with the tractor there will be real advantage in allowing the soil a reasonable time to dry out after heavy rainfalls, but in most cases this time can be easily more than made up. The ten-hour day is not the limit for the tractor, so that, after all, those who oppose the tractor because of its inability to work in wet soil make little headway with their arguments. It is amazing how the big drive wheels will get toe hold under all conditions and the work last week following the heavy rains convinced thousands of visitors that an inch or two inches of rain does not necessarily tie up the work of soil tillage for a long period.

EVEN THE CORN CULTIVATOR-TRACTOR WAS AT WORK AT FREMONT.

If there was keener interest taken in the tractor this year than ever before, this was possibly due in part to the farm labor scarcity that producers are facing. Thousands of farm workers will soon be called upon to take up military duties, and substitutes for them on the farm are not available. Production must be maintained nevertheless. Indeed, production will be increased if one may judge by the determination shown by those who feel the responsibility that is now placed on the shoulders of food producers. Under these circumstances the tractor shows up in its most favorable light. The fact that one man with a tractor having power enough to pull three plows can turn under anywhere from 100 to 150 acres during the ordinary plowing season is in itself enough to convince those who are short of man power of the practicability of the internal combustion engine in the field. This solution of the labor shortage problem is making strong appeal to the corn grower as well as to the individual who specializes in small grain, and the fact that nearly 70,000 tractors have been put into use in 1917 furnishes ample proof that the experimental stage has passed and that the novelty has worn off. Carburetor troubles that were so prevalent a few years ago have largely been solved and, while the individual who is an expert machinist will find much in his favor when he comes to handle a tractor, yet the farm boy has proven himself equal to the emergency. Indeed, where it has been tried out it has been found that power farming makes stronger appeal to the young men than horse farming, so that in the end the coming of the tractor may have something to do with adding to the attractiveness of farm work and farm life.

Credit is due to the tractor manufacturers, their representatives, and to the progressive citizens of Fremont for the manner in which the tractor show was put on and for the way the crowds were handled. Pres. J. B. Bartholomew, of the tractor men's association, has been enthusiastic in his efforts to show the farmers the real merits of the tractor, while much of the detail work in managing the show has fallen upon the shoulders of A. E. Hildebrand, who was everywhere in evidence during the show, attending to marking the fields and placing the machines. The Fremont demonstration has outgrown the fondest expectations of its originators, but the men who inaugurated it have capacity to handle even bigger things. It is quite a trick for a city of 7,000 or 8,000 people to take care of many thousands of visitors who attend the annual tractor show. But everything considered, Fremont did very well. Private homes were opened for visitors and reasonable rates charged for rooms. A very large number of citizens put their private cars into taxi service in order to help accommodate the crowds. Those who were connected with the management of the show and the handling of the crowds merit the commendations which were heard upon all sides.

The following list includes the names of manufacturers of tractors and plows who took part in the demonstration last week:

Advance-Rumely Thresher Co., Inc., Laporte, Ind.; Albaugh-Dover Co., Chicago, Ill.; Albert Lea Tractor & Mfg. Co., Albert Lea, Minn.; Allis Chalmers Mfg. Co., Milwaukee, Wis.; Aultman & Taylor Mchy. Co., Mansfield, Ohio; Avery Co., Peoria, Ill.; B. F. Avery & Sons, Louisville, Ky.; C. L. Best Co., San Leandro, Cal.; Buckeye Mfg. Recently the Farmers' Equity Elevator & Warehouse Co., of River Falls, shipped two carloads of wool to Chicago. The wool brought 63 cents per pound, the highest price ever paid at River Falls. One farmer marketed two loads of wool and received $1,800. Another farmer got $1,000 for one load.

The Price of Lumber

Now is the time for the farmer, above all others, to build! He has the job of feeding *the world* and he needs more buildings, more granaries, more dairy houses, hog houses, poultry houses than ever before.

At the same time, by good fortune, his bushel of grain, his ton of hay, his pound of butter-fat **will buy more lumber than ever.** Compared with the prices of other things, "Old Faithful"

HEMLOCK Is Cheap Now!

Many things have gone up more in one year than "Old Faithful" HEMLOCK has gone up in ten years, and nothing has done much better for its producers than farm products. The Farmer is pretty nearly President of the World today. So don't forget that you buy your lumber not with dollars but with what you raise.

Build what you need now of "Old Faithful" HEMLOCK and you get a BARGAIN.

Tell us what you want to build, give your lumber dealer's name and we'll give you experts' working **PLANS FREE.**

FARM MECHANICS

Questions and Answers.

Retreading Tires.

I would like to know if it would be dvisable to cut the tread out of old res and cement these treads on other res to make them wear longer. What ind of cement would be required for his purpose?

Answer.—This is sometimes done. tubber vulcanizing cement is used. 'he old tread should be vulcanized to he tire. A vulcanizer and special orms are necessary in order to do the ob properly. Some automobile or re repair shops make a specialty of his work.

A Small Tractor.

I have a six-horse-power Ellis en-ne that I would like to make into a actor. The speed of the engine is bout 800 R. P. M. Would this engine ave power enough to pull a plow? If , how low must it be geared to pull twelve-inch plow five inches deep? intend to use binder wheels for driv-g. The engine is a kerosene or gaso-ne engine. Which fuel would be best use and give the most power? If is outfit has not enough power for owing, what other implements would pull successfully?

Answer.—This engine should pull a 'elve-inch plow five inches deep un-ss the conditions are unusually hard. ear it down to two or two and one-lf miles per hour. This engine ould also pull a cultivator, a mower similar implement successfully. ou would probably get a little more wer out of gasoline, but the differ-ce would be small and if your en-ne will really burn kerosene success-lly it would be better to use kero-ne.

Ford Wiring Diagram.

Please publish a diagram showing wiring of the Ford ignition system. I should cut off one-eighth of a

FIGURE 1.

nd from each piston, would the mo-have more power or the car be e speedy?

nswer.—Ford engine pistons are light as it is practical to make m with safety. The lighter the on the greater the power of the motor, other things being equal; also the faster the engine will run. It is doubtful if two ounces off each piston would make a very noticeable differ-ence.

Figure 1 is a wiring diagram of the Ford electric system complete. T is the timer, C the coil box, L the light-ing switch, M the magneto terminal, H the horn, P the plugs and BB the light bulbs. HS refers to the horn switch and GR to the ground connec-tion on the frame or radiator.

Pistons Stuck.

Could you advise the proper treat-ment of an auto engine in which the pistons have stuck? The car runs now, but heats quickly and does not seem to get oil properly.

Answer.—Remove the cylinders and examine the cylinders and pistons. If they are badly scored the only thing to do is to have the cylinder rebored or ground and fitted with new pistons and rings. If the scratches are not very deep polish off the high places with emery cloth. If the rings are scratched new rings should be used. Examine the lubricating system and make sure that the cylinder is getting enough oil; not too much, as too much will cause carbon trouble. After reassembling the motor, run it under light load for the first hundred miles, in order to give the new sur-faces in the cylinder a chance to wear in before a heavy load is put on the engine.

Determine if possible why your en-gine heats quickly, as the heating was probably responsible for the pistons sticking. Defective lubrication, a loose fan belt, carbon in the cylinders, running with the spark too late, run-ning with too rich a mixture and run-ning for long periods in low gear are the common causes of overheating.

Three-Horse Evener for Wagon.

Some time this spring you gave us a cut and dimensions of a three-horse doubletree for a wagon. It was mislaid. Would you please publish it again?

Answer.—We are publishing a sketch of this evener in Figure 2. SSS are ordinary singletrees. D is a short doubletree. T is a tripletree. I is a heavy iron strap bolted across the rear end of the wagon tongue. One end of the strap is turned up and the chain, C, fastened to it. The other end of the chain is fastened to the tripletree at a point distant from the

FIGURE 2.

doubletree clevis one-third the dis-tance between the doubletree clevis and the singletree clevis. The chain, A, has one end fastened to the end of the tripletree and the other to the under side of the tongue, as shown in the figure. This chain prevents the tripletree from crowding over. The hitch may be shortened by mounting D on top of T.

The chains should be made of three-eighths-inch or seven-sixteenths-inch rod. D should be made of hardwood two inches thick and four inches wide. It should be thirty-six inches long for twenty-eight-inch singletrees, or forty-two inches long if thirty-six-inch sin-gletrees are used. T should be made of hard wood, two inches thick and five inches wide. If twenty-eight-inch singletrees are used, T should be fifty-two inches long, or sixty-eight inches long if thirty-six-inch singletrees are used. All holes should be drilled three inches from the end of the tree. It is well to reënforce the ends by binding them with strap iron.

The Tractor You've Been Looking For

THE Allis-Chalmers is the ideal all-work tractor for the average size farm in this section of the country. It has ample power and wastes none in propelling unnecessary weight. It will do your plowing, disking, dragging, drilling, harvesting and hauling better, faster and cheaper than horses. It is always ready for pumping, corn shell-ing, sawing, feed cutting, silo filling and all other belt work.

Easy to Get at Every Part

The simple design and construction of the Allis-Chalmers Tractor make it easy to grind valves, take up bearings and make repairs and adjustments without loss of time.

The minimizing of vibration, due to the one-piece, steel, heat-treated frame, and the perfect balance of reciprocating parts, make for long life. There are no bolts or rivets to work loose—frame cannot sag under heaviest strains.

The special Allis-Chalmers radiator insures perfect cooling under all loads. There is no instance on record of an Allis-Chalmers Tractor overheating.

The tractor is absolutely dust-proof—an-other reason for its long life. No dust or grit can possibly get into bearings or vital parts. This tractor has behind it the Allis-Chalmers name and reputation of 60 years as a leader in the building of high grade machinery—ask your banker.

Uses Gasoline or Kerosene

ALLIS-CHALMERS 10-18 H.P. FARM TRACTOR

Get Your Engine's Longest Life Through Friction Drive

YOU put no undue strain on your engine by careless handling of the clutch. You cannot strip the gears—nor can you start the load with those sudden jerks which invite break-ages and repair bills. You get the full power of the heavy duty four cylinder engine melted into a flexible flow through the friction drive. That's why the

Heider

9-16 Made and Sold by Rock Island Plow Co. 12-20

has made a remarkable record for low upkeep cost. "My re-pair costs were less than 40 cents for the past year" says an owner. Think of the ease, the convenience and the economy of using such a tractor. Touch one lever to start, stop or reverse. Owners say that this Heider friction drive is the greatest feature ever built into a tractor.

Standard four wheel construction—four-cylinder, heavy duty Waukesha Motor. Heider construction has been making good for over nine years. Backed by its own experience and sixty-two years of building Rock Island Farm Implements and their reputa-tion in all parts of the world.

Write for our catalog and a few letters from owners.

Pickles.

There have been numerous requests for pickle recipes and a few of our readers have complained that they are unable to keep cucumber pickles either canned or put down in brine. The first essential in successful pickle making is that all materials empl yed be of the very best. The products to be pickled should be fresh and absolutely free from blemish, and the best grade of spices and vinegar should be used. Agate or porcelain-lined kettles are the safest to use in pickling operations and wooden spoons for mixing are preferable. Many excellent pickle makers add a little fresh grated horseradish to every jar of pickles. This prevents mold and at the same time keeps the pickles crisp and gives them a good flavor.

Cucumber Pickles.—Select medium-sized cucumbers, wash thoroughly, cover with salt water and let soak twenty-four hours. Then wash and pack in jars. Heat vinegar, sweetened and spiced to taste, boiling hot and pour over the pickles. Put caps in place on the jars and let stand until the next morning, then pour off the vinegar, heat and pour back over the pickles. Do this three days in succession, sealing the jars the third day. Be sure that the vinegar is of the very best. The pickles should be crisp and tender.

Mustard Pickles.—One quart chopped onions, one quart chopped cucumbers, two quarts chopped green tomatoes, one head chopped cabbage or cauliflower, six chopped green peppers. Salt and let stand over night; then boil until tender, make a dressing of three quarts good vinegar, six cups sugar, one-fourth ounce tumeric, four teaspoonfuls celery seed, one-half pound ground mustard, one cup flour. Rub dry ingredients together, stir till smooth in vinegar and boil until it thickens (two or three minutes). When cold pour over the cold vegetables and seal in warm jars. The mixture will thicken somewhat after standing a few days.

Cauliflower Pickles.—Divide a large head of cauliflower into pieces, wash and boil, with a dozen white button onions, in salted water until about half done. Drain the cauliflower and onions and add a dozen dill pickles cut into half-inch cubes. To two quarts of vinegar add two cupfuls of sugar, two teaspoonfuls of celery seed and one teaspoonful of mustard seed. Bring the whole to a boil. Mix together three-fourths of a cupful of flour, a quarter of a pound of ground mustard, a tablespoonful of tumeric powder and enough cold water to make a paste. Add this mixture to the boiling vinegar and continue the boiling five minutes longer, then add onions and cauliflower, reheat and seal.

Chutney Sauce.—Select twelve green, sour apples, two green peppers, six green tomatoes, four small onions, one cup seeded raisins, one quart of vinegar (if strong, dilute), two tablespoons salt and two cups brown sugar. Remove seeds from peppers, add tomatoes and onions, chopped fine; raisins, spices, sugar, salt and vinegar. Put on and let simmer slowly for about three-fourths hour. Then add the apples and cook until they are tender, but not mushy. Put in bottles and seal. Delicious relish for meats.

Sweet Mixed Pickle.—One peck firm green tomatoes, one dozen onions, one dozen green peppers, one cupful salt, one pound sugar, one-half cupful grated horseradish, one tablespoonful ground black pepper, one tablespoonful ground mustard, one tablespoonful whole white mustard seed, one tablespoonful celery seed, vinegar. Chop green tomatoes, onions and peppers together, after adding the salt. Let stand over night to drain. Put in a porcelain kettle with sugar and seasonings. Cover with vinegar and boil gently for one hour.

Oil Pickles.—Slice 100 medium-sized cucumbers. Cover with strong brine and let soak three hours. Wash with cold water. Add three pints white onions (which have previously been soaked in water with a small piece of alum), three ounces white mustard seed, one ounce celery seed, two ounces white pepper, one pint olive oil. Mix and cover with cold vinegar. Seal in jars.

Dill Pickles.—Take medium-sized cucumbers. Let them stand in water overnight or twenty-four hours. Remove, wash and dry. Put grape leaves on the bottom of a stone jar, then pack in a layer of cucumbers very solid and cover with dill and cherry leaves. Repeat this process, being sure that the cucumbers are packed in solid and that plenty of dill is used. When the jar is full, cover with dill, cherry leaves and grape leaves; some horseradish may be added. For a two-gallon jar mix one-half cupful coarse salt, one cupful vinegar and one gallon of water until the salt is dissolved. Pour over the cucumbers, place a plate on top and a weight on top of the plate. It is essential that cucumbers be held down solid. Do not put into a cool cellar for ten or twelve days. Remove pickles as needed, replacing weight each time.

Piccalilli.—Six red peppers, six green peppers (hot peppers), six onions, six green tomatoes, one small head cabbage. Put onions on and let come to a boil, then drain off water, remove seeds from peppers. Then chop peppers, onions, tomatoes and cabbage and grind through a meat grinder. Put in kettle and to each quart add one tablespoon of mustard, one tablespoon of sugar and one tablespoon of salt. Pour over sufficient vinegar to cover. Let come to a boil, then put in cans. Will keep all winter and makes a very delicious relish.

Cucumber Salad.—Eighteen green cucumbers peeled and sliced, not too thin. Sprinkle with a handful of salt and let stand one hour. Then drain and to this add six large onions chopped fine, one quart of vinegar, one cupful sugar, one teaspoonful cinnamon, one teaspoonful tumeric, two teaspoonfuls mustard seed, one-half teaspoonful each celery salt or seed, ginger and black pepper. Mix all together and let boil up once. Then put in jars and seal.

Use Your Nose or Eyes—Not Your Tongue.

One cannot use too much care or caution in handing and storing poisons and chemicals in the home. The writer's attention has just been called to a recent case in which a lady caught up a bottle of what she supposed was a face lotion, poured some into her hand and rubbed it on her face. It was not face lotion, but carbolic acid. Luckily, none of the acid got into her eyes, but her face and hands were badly burned. The writer has known of several similar cases, as when a barber applied carbolic acid instead of bay rum to a customer's face; and when another person took a mouthful of ammonia water instead of tooth wash. All of these accidents, and most of those of like character, resulted from haste, and from carelessness in storing, labeling or handling dangerous substances.

Many plans have been suggested for avoiding mistakes of this kind, such as having containers of special form—three-cornered, corrugated and screw-top bottles; pins thrust through cork; tiny sleighbells tied to the bottle; and many similar devices. Every person in a household should either fully understand what chemicals are kept in the house, where they are kept and how they should be used, or should not be able to get at such chemicals at all.

Have every bottle of medicine, and every dangerous chemical, no matter how often or much it is used, in a distinctive substantial container with a proper and permanent label. Make it impossible for children to get at or into the medicine closet. Leave nothing about by which children can possibly get poisoned or injured. Never drink or take anything in the dark! Never guess at the character of a substance! Find out what it is before you use it, or let it alone. Never use tablets or capsules left lying about loose without proper container and label. Look twice at everything you use from a bottle or medicine box. Use your nose and your eyes and not your tongue.—[C. E. Vail.

Canned Tomato Sauce or Puree.

Since tomatoes contain a very high percentage of water it often is desirable to can only concentrated tomato products. This is true especially when cans or jars are difficult to obtain. A delicious concentrated tomato sauce may be made and canned as follows, says the United States Department of Agriculture. Small or broken tomatoes and large tomatoes unsuitable for canning whole may be used in this recipe.

Cut the tomatoes into fairly small pieces and add a large-sized onion chopped and one cup chopped sweet red pepper to one gallon tomatoes. Cook until tender. Put through a sieve and add a mixture of one-third salt and two-thirds sugar in proportion of one teaspoonful to each quart of the mixture. Cook until the consistency of ketchup, stirring constantly. Pack hot into sterilized jars or bottles. Adjust rubber and cap—place the containers on a false bottom in a vessel of water sufficiently deep to reach almost to their tops and allow to remain at a boiling temperature for twenty-five minutes. Remove jars from the water bath and tighten the lids immediately.

Bread Dumplings.

To the Editor:—I always read the letters in the Home department, and as I get many good recipes I will tell Mrs. H. L. how I make my bread dumplings.

When I put my bread in the pans I take a small piece of dough about the size I would use for a biscuit or bun. I pull it out quite thin and flat and then put in a few slices of apple with a small piece of butter and a little sugar and cinnamon, and bring the dough up around it, pinching the sides all together so the juice will not run out. Then I put them in a steamer, being sure not to cover the holes, as the dumplings rise like bread or biscuits and spread. I let them rise about the same time as for biscuits and then steam half or three-quarters of an hour over a pan of water. I place a clean tea towel or bread cloth over them and a tight cover over that, weighted down. The cloth takes the steam so the dumplings do not get soggy. Do not remove the cover while they are steaming.

Of course, the dumplings are small and I usually serve two to each person. Serve with cream and sugar.

Mrs. G. D. S.

To Take Out Grass Stain.

Miss V. M. S. writes:

Will you please tell me how to get grass stain out of a white garment? I did not notice the stain until after the garment had been washed and although I have tried several things I am unable to remove it.

You should be able to get the grass stain out of your white garment by soaking in alcohol and then washing with naphtha soap and warm water. Sometimes an application of molasses or a paste of soap and cooking soda, left on overnight, will remove grass stain. Ammonia water is good for a fresh stain, but since you have washed the garment it may not be effective in this case.

Brussels Sprouts.

To the Editor:—I wonder if any of the readers can tell me how to cook Brussels sprouts and how to put it away for winter use. Would also like to know if cauliflower can be prepared any other way for table use than pickling. I would like to know how other housekeepers use these two vegetables.

Mrs. J. C. M.

Is a Dress Form Helpful in Sewing?

To the Editor:—I am a young housekeeper and like to do my own sewing, but have a great deal of trouble fitting my dresses. I have been thinking of getting a dress form, but I want to be sure it will be a help to me before I make the investment. I have heard some say that they are all right and others have said that they are not. I wonder if any of our readers have used a dress form and if it has proved to be a success or a failure. I am anxious to get one if it will make my sewing easier. Was thinking of getting one of the adjustable kind. Will not someone who has had experience with a dress form tell me whether they can be depended on or not?

Subscriber.

THE YOUNG FOLKS

Member of Junior Red Cross Society.

Dear Younk Folks:—I am a little girl nine years old. I have been reading the letters in the Young Folks' column and I want to write, too. We live on a small dairy farm and have lots of cows and calves, chickens and pigs and different kinds of pets. We have a mother dog that raised four nice pups this spring. We sold three and kept one for a watch dog.

We have been having good times this vacation, for we took several nice trips in the car and are planning to go to the lakes and spend a few days fishing and swimming.

My three sisters and I belong to the Junior Red Cross Society. We children have raised over $90 altogether by having tag day and some entertainments. We are also making pillows, wash cloths and other things for the soldiers in the hospitals.

I will close with a riddle. What table has no legs?

Dorothy.

Has a Fine Garden.

Dear Young Folks:—I am a girl twelve years old and live on an eighty-acre farm six miles from town. I have written once before to the Young Folks, but did not see my letter, so I will try once more. I read all the letters and think they are fine.

I think Emma's story about Metta and the prince was a good one. I wish some of the other boys and girls would tell some stories.

Have any of the girls a little garden of their own? I have and I take good care of it. There is not a weed in it. I have onions and did have radishes and turnips, but we have eaten nearly all of them. I have some potatoes, too.

Mama and I together have raised about 100 little Brown Leghorn chickens. Our biggest chickens are big enough to fry. We have had one mess of fried chicken.

Opal.

Lives on a Big Ranch.

Dear Young Folks:—I am a boy twelve years old. I live on a 2,200-acre ranch. Papa and grandpa own many cattle. We milk thirteen cows. I have two brothers and two sisters. We have a little dog named Woodie. He is as white as snow.

I like to read your letters very much and hope you children will always keep the letter page full. This is the first time I have ever written you a letter.

Harold.

A Literary Society.

Dear Young Folks:—I live on a farm of 120 acres. I am thirteen years old and am in the eighth grade. I hope you will enjoy reading my letter.

Last November our school formed a literary society and every Friday we have a meeting or a program. At one of our meetings we voted upon the name, colors, flower, motto, yell, poem and song of our school. The name we chose was "Happy Hollow." The colors are purple and gold, the flower is a violet and the motto "More haste less speed." Our yell is "Yip, zip, boom hum, Happy Hollow! Here we come." The name of the poem is "Memories of Happy Hollow," and the name of the song is "Happy Hollow." The poem was written by one of the boys and I wrote the song.

I like to go to school. I expect to graduate next year.

Kenneth.

Bovee's Pipeless Furnaces
Sold at Manufacturer's Prices

The most practical heating plant used. Twenty years on the market. Saves 30 per cent on cost and 10 per cent on fuel. We manufacture five sizes suitable to heat from a small cottage to a large church, including our old reliable No. 40 Pipeless with 28-inch combustion chamber and all fittings, for

$86.00

Waist 2163-Skirt 2179—A smart combination. Waist pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 3¼ yards of 36-inch material for a medium size. Skirt pattern is cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. It requires 3⅛ yards of 44-inch material for a 24-inch size. Two separate patterns, 10 cents for each pattern.

2174—A simple dress for school or play. Pattern is cut in 4 sizes: 2, 4, 6 and 8 years. It requires 2½ yards of 27-inch material for the dress and 1½ yard for the guimpe, for a 4-year size.

2167—Girls' "cover all" apron. Pattern is cut in 5 sizes: 4, 6, 8, 10 and 12 years. Size 10 requires 2½ yards of 27-inch material.

1521—A trim and popular suit for other's boy. Pattern is cut in 4 sizes: 3, 4, 5 and 6 years. It requires 2⅜ yards of 36-inch material for a 4-year size.

2188—A smart style for afternoon or home wear. Pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 5⅜ yards of 44-inch material for a 36-inch size.

2176—A simple dress for school and home wear. Pattern is cut in 4 sizes: 8, 10, 12 and 14 years. It requires 1¾ yards of 27-inch material for the guimpe, and 3½ yards for the dress, of 36-inch material, for a 10-year size.

2009—A comfortable and an attractive lounging robe. Pattern is cut in 4 sizes: 34, 38, 42 and 46 inches bust measure. It requires 6⅝ yards of 44-inch material for a 34-inch size.

1805—A simple practical ladies' apron. Pattern is cut in 3 sizes: Small, medium and large. It requires 3¼ yards of 36-inch material for a medium size.

1991—Girls' dress in overblouse style, with guimpe. Pattern is cut in 4 sizes: 8, 10, 12 and 14 years. It requires 1¾ yards of 36-inch material for the dress, and 1½ yards for the guimpe, for a 12-year size.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for August 19, 1917.

Finding the Book of the Law.

LESSON TEXT—II Chronicles 34:14-33.

GOLDEN TEXT—I will not forget thy word.—Psa. 119:16.

I. The Book of the Law Found (vv. 14-17). 1. The occasion (v. 14). It was found while the work of repairing the temple was going on. At what part in the temple we do not know; perhaps in the treasure house, for it was found while bringing out the money to pay for the repairs. Perhaps this was in or near the ark, for the law was usually kept in or by the ark.

2. By whom (v. 14.) Hilkiah, the high priest, was the finder. It is strange that the high priest was ignorant of the place where the law was found. It is a sad comment upon the moral and spiritual condition of priests and kings, since they were appointed guardians of God's law. It is, however, always true that when one does not want to have his life ordered by the Bible he will put it out of his sight. The disappearance of the Bible from our homes, and the neglect of it in our study, is a certain sign of evil in our lives. Be assured, however, that though the law of the Lord be removed from our sight it shall sooner or later come before us to judge us. God has declared that his Word shall not return unto him void, but shall accomplish that whereunto it hath been sent.

3. Its disposition (v. 16). Hilkiah gave the law to Shaphan the scribe, who delivered it to the king along with his report as to the disposition of the money which had been collected.

II. The Book of the Law Read (vv. 18, 29, 30). 1. To the king (v. 18). This was a most impressive scene, the king listening to the reading of the law of God. It was the proper thing to do, for those appointed by God to rule over the people should be anxious to know the will of God concerning them. The pious king, believing in it as God's Word, was anxious to know God's thought concerning the nation. His interest became intense, as he was made conscious of the apostasy of his people from God's law. His chief anxiety was to know what was God's purpose as to the nation in view of their idolatry. It is a sensible thing to make oneself intelligent as to his responsibilities, even to know what judgments shall befall those who have turned from God. One should know the worst while there is time yet to escape his wrath, for repentance is the only door of escape from perdition.

2. To the people (vv. 29, 30). At the direction of the king the priests, elders and all the people were called together to hear God's Word read. This was as it should be. People have a right to hear what God has to say to them as well as the king. To keep the people ignorant of the Word of the Lord is a great crime. The crying need of the age, with all its boasted knowledge, fine church equipment and cultured ministry, is for the Word of God to be brought to the ears of the people.

III. The Effect of the Reading of the Law. (vv. 20-28; 31-33). When God's Word is intelligently read and understood there is bound to be an impression made.

1. The king rent his clothes (v. 19). The man who will honestly listen to the reading of God's Word will be brought to his knees, for he will be convicted of sin, and will take the place of self-abasement before the Lord. The king first saw his own sins and confessed them. It is a good sign when one sees his own shortcomings and failures, and not primarily those of others.

2. The king made inquiry of the Lord through Huldah the prophetess (vv. 22-28). His supreme motive in this inquiry was to find out whether there was some way to avert the awful judgments which were impending, as set forth in the Word of God. After all, the human heart instinctively turns from threatened woe to inquire whether there is not a way of escape Alongside of the flaming, thundering Sinai was placed the Levitical system of offerings. Law and grace are not far removed. The law becomes our schoolmaster to bring us to Christ. Through Huldah the message came that God had taken account of all their sins and that judgment must fall, but Josiah would be spared the sight of all God's visitation of wrath. The penitence of the king turned aside God's wrath from himself, but the nation would be obliged to suffer for its awful apostasy.

3. The king made a covenant (vv. 31, 32). This was to the effect that he would walk in the commandments of the Lord. He also made the people stand to this covenant. He no doubt acted from the sincerity of his heart.

4. Further reforms (v. 33). Josiah now reached out as far as the national boundaries, took away their abominations and made Israel to serve the Lord their God. The fact that the book of the law was found implies that it had been lost. The way it had been lost is not definitely set forth, but numerous ways may be suggested. The Bible is a lost book to many professing Christians today, maybe through lack of interest in it, willful neglect or neglect through the stress of life's business and pleasures. May we not each one inquire as to whether our Bibles are lost?

Western Electric Country Home Light Plant

Brighten up your place with Electricity. Now is the time to plan for better lights for this Fall and Winter. It will mean not only safe and reliable lights, but a steady source of power that will pump water, turn the cream separator, wash and iron the clothes, and save your wife all the drudgery of housework.

Electric light is so easy to have when you can make it the Western Electric way! There's just the generator and storage battery in the plant, and you run it from your gas engine. Nothing complicated. As easy to take care of as the Western Electric farm telephone you have in your home. There's 40 years of electrical experience back of both of them—that's the reason.

Running water downstairs and upstairs, with an electrically driven pump.

There is a Western Electric plant exactly suited to your needs. And there are Western Electric lamps, and motors, and pumps, and cream separators, and irons, and washing machines, and numerous other appliances—all built expressly for use with Western Electric plants. Learn about them and how easily you can get electricity on your place.

The constant speed of the electric motor means better separation of the cream.

LEGAL DEPARTMENT

SUBSCRIBERS who desire questions answered in this department should base them upon a brief, plain, concise statement of the actual facts. To insure immediate attention, inquiries should be addressed to "The Legal Department," in care of this paper; but as the inquiries sent are at times very numerous, thus delaying printed answers, those to whom it is important to receive an immediate reply by mail, should remit $1.00, addressed as above. All inquiries must be signed if they are to receive attention.

Law Questions.

Trespass by Dog—Damages.

A Wisconsin Subscriber.—A lives just across a public road from B's place in Wisconsin. A keeps a dog which is continually trespassing on B's place, and it scratches up beans and other things growing there. B has asked A to keep his dog shut up, but A refuses to do so. Has B a right to kill the dog?

Answer.—B has no right to kill the dog, but he can recover damages from A for all injury done by the dog on his premises.

Mortgage and Interest.

A Subscriber, West Allis, Wis.—My father owned property in Wisconsin and died without making a will, leaving seven children, one of whom died shortly after father's death. It now appears that this child gave a mortgage on his one-seventh of the estate left by our father. Is said mortgage valid in law, and can it be collected with interest thereon?

Answer.—The mortgage is valid in law, and can be collected with whatever interest is provided for by the terms of the mortgage.

Division of Partition Fence.

A Subscriber, Brookfield, Wis.—My neighbor and I own adjoining farms, and the division line runs to a public road. In measuring this line to divide the fence between us my neighbor measured up to the fence along the roadway, and I measured to the middle of the road. Which one is correct?

Answer.—Your neighbor is correct. The actual partition fence extends to the road fence, and not to the middle of the road. Each one is required by law to build half of the actual partition fence.

Partition Fence—Fence Viewers.

A Subscriber, Medford, Wis.—A man owns forty acres of land adjoining my farm. This man does not use his land for farming, as it is all timber land. There is no fence between his land and mine and my cattle bother the neighbors. Can I compel him to build half of a partition fence?

Answer.—You can compel the owner of the forty acres to build half of the partition fence. Call upon the fence viewers of the town to meet and order him to construct his part of the fence and they will do so.

Defective Bridge Work.

A Subscriber, Pekin, Ill.—Last fall a small concrete bridge was put in on the road over a creek close to our house and a concrete floor was put in the bed of the creek under the bridge, but by mistake the floor was laid two feet higher than the bed of the creek. We have tile drains from the house and fields which empty into the creek about ten feet from the bridge above it, and these tile drains become obstructed by back water on account of the high concrete floor. Can we compel the township to lower the floor?

Answer.—The proper course for relief in this matter is to apply to the commissioners of highways.

Terms of Written Order Binding.

A Dairy Company, Loyal, Wis.—We signed an order to a stock food company in Minneapolis for a quantity of stock food compound, amounting to $87, agreeing to pay same without any reduction for any reason within thirty days, 2 per cent discount being allowed if paid within ten days. At the bottom of said order, in very fine print, among other things it stated as follows, viz.: "This order is not subject to cancellation, neither are the goods consigned, but are sold outright and cannot be returned without instructions from us. No written or verbal agreement on the part of our agent is binding on us. I have read carefully all the terms and conditions in this order and agree to be bound by them." We signed under, but did not read the fine print quoted. The agent wrote in pencil on the order as follows, viz.: "I hereby agree to coöperate personally selling goods at this point until this order is sold," and signed his name thereto. The agent stated that we were to have no competition in the local field. We signed the order on the strength of the agent's promise and statements. We find that the food company has an agency in this town, established more than a year ago, and the agent has failed to keep his promise to help us sell the goods. Are we obliged to keep the goods and pay for them?

Answer.—Under the terms of the order you signed you will have to keep the goods and pay for them. The agreement of the agent does not relieve you. The fact that you did not read the fine print on the order does not relieve you. No person should sign any kind of a paper without reading all of it.

No Pay For Blunder.

A Subscriber, Park Rapids, Minn.—A rented his farm to B and told him where the division line was between said farm, and the adjoining farm. In the spring B plowed across the line on the adjoining farm. Can he collect pay for the same?

Answer.—He cannot recover any pay for plowing on the adjoining farm.

Trespass on Unfenced Land.

A Subscriber, Cambridge, Wis.—(1) What is the law of Wisconsin about driving cattle along a public road where the road is not fenced? (2) Where land is not fenced from a public road, can the owner recover damages in case animals driven along the road trespass on his land?

Answer.—(1) The driver of the cattle must exercise due care to prevent cattle from trespassing on land and if he does so the landowner cannot recover damages if the cattle go upon his land. (2) The landowner cannot recover damages unless he can show that the driver of the cattle was negligent and careless.

Wages of Hired Man—Replevin.

A Subscriber, Black River Falls, Wis.—A contracted with B to do some work for him, and hired C and others to help him do the work. A paid all the men by orders on B, and B cashed all the orders except one for C, which he refused to pay until C finished the work for B according to the agreement. Meanwhile A bought personal property from C and paid him cash for it, and when A went to get the property C refused to let him have it until A paid C for the work. (1) Can C hold A responsible for his wages? (2) How can A get the property he bought from C?

Answer.—(1) As C was hired by A, C can hold A responsible for the payment of his wages. (2) When A bought the personal property from C and paid him cash for it, the title to the property passed to A, and as owner of it, he can bring a suit of replevin against C for the property and recover the same by law.

Lien for Labor.

A Wisconsin Subscriber.—B contracted with A to build a certain building for him for a certain price. The contract was verbal. B then hired C to help him do the work, and when they had almost completed the building, A concluded to not have it entirely finished, and paid B most of the contract price, retaining only enough to finish the building, and both were satisfied, but B did not pay C for his work on the job and now C demands that A shall pay him for his work and threatens to put a lien on the building for the same. Can C do this and if he does, what can A do?

Answer.—If C gave A written notice that he was employed on the job within thirty days after he did his first work and filed with the clerk of the district court copy of such notice and a statement of his claim within sixty days after he did his last work he has a lien on said building, and can enforce the same against A, and the only thing for A to do is to pay C for his work. But if C failed to give notice and file same with his claim he has no lien and A is not required to pay him.

Mother's Pension.

A Subscriber, Brodhead, Wis.—(1) Under what conditions can a woman get a mother's pension in the state of Wisconsin? (2) Where a mother has two little children, and her husband has left her, in the same town, how much pension can she get and how would she proceed to get it?

Answer.—(1) When a mother is unable to support and properly care for her children she can obtain aid from the county, which is commonly called a mother's pension, although not called by that name in law. (2) In such a case the mother should present to the juvenile court or the county court a petition stating the facts and showing that she is unable to properly care for her children and asking for county aid. After hearing the matter the court will grant the mother such aid for the support and care of her children as it deems just and right, not exceeding $12 per month for one child and not exceeding $4 per month for the other child, but may temporarily increase these amounts in case of sickness or other unusual conditions.

FARMERS' MARKET

Wanted—For Sale—To Exchange

THIS department is to bring the buyer and the seller together. You may have live stock, poultry and eggs or machinery for sale. You may want to sell or buy a farm. Write your copy for the advertisement. The rate is six cents per word, each insertion.

The Wisconsin Farmer, Madison, Wis.

CEMENT BLOCK MACHINE.

FOR SALE—Separator; cement block machine; [illegible] Mrs. A. D. [illegible], Waukesha, Wis.

Live Stock Exhibited at Early Wisconsin Fairs.

To the Editor:—Down to the early seventies the only cattle given premiums at the county fairs of Wisconsin were Durhams, Devons, natives, grades and crosses. Kenosha and Walworth counties held fairs in 1850, and Waukesha county claims to have held a fair eight years earlier; at the Walworth county fair two Durham bulls were exhibited and sold. They had been brought from western New York by Josiah Brooks. Bull "Herod" brought $210 at auction and the other animal sold for $150. County societies offered premiums for Durham and Devon cattle, as they were the only cattle of known breeding in the state. As a rule the cattle department was divided into a division for working oxen, one for milk cows, and fat steers. The white-faced beef animal, the Hereford, was given premiums at the Racine county show of 1857 and an Ayrshire cross-bred animal had been exhibited at the Green county fair three years previous. The dairy breeds began to enter the county show rings about 1869, when a class of Swiss cattle was placed at Fond du Lac; the next year a pure-bred Ayrshire was exhibited at the same show. The Jersey made her appearance in 1875, and the Guernsey in 1882, although they had been preceded by their sister breed, then called the Alderney, but now known as a branch of the Guernsey aristocracy. Holstein cattle were shown at Kenosha in 1880, and Polled Angus were exhibited at the same place two years later. The Red Polled breed appeared in the premium awards at the Richland county fair of 1887, while the Dutch Belted stock was shown at Elkhorn in 1911. Such was the history of the cattle at our early fairs, according to the accounts published in Wisconsin newspapers, beginning with the time when oxen were still beasts of burden and the horse a gentleman's animal.

The first classes for horses offered at the early fairs were divided more as to sex, age, and use than as to breeds. The first horses were probably descendants of the old Conestoga and French Canadian horses. By 1850, new blood had been introduced into the state in the form of the English thoroughbred (or the so-called "blood horse") and through that beautiful little Morgan horse with which our grandfathers were so familiar. Spirited horses of the two breeds appeared both on the track and in the show ring. The counties of central and southwestern Wisconsin were very much taken up with the thoroughbred, while the Morgan was in evidence at practically every county show in the state by 1860. About ten years later the farmers began to demand that they have heavier animals to replace the Morgan and Hambletonian "horse of all work." The latter term was inclusive enough to refer to all animals of sufficient speed to hitch to the family carriage and carry their owner with fair speed and safety. "Louis Napoleon," a French draft horse, was exhibited at the Walworth county fair of 1870; a number of Clydesdale stallions were shown at Beaver Dam in 1874, and at the Green county show of the next year. The Percheron horse, which has since proved to be the most popular draft horse in the state, was given the ribbon at the fair at Monroe in 1880. The fair records show that the coach breeds were first exhibited at Wisconsin county fairs during the early eighties. A Cleveland bay stallion was on the grounds of the Columbia Association during the show of 1885, a French coach animal was shown at the Grant county fair four years later and a Hackney stallion won the blue at Monroe in 1894. The large importations of draft horses into the country during the early nineties caused the Shire stallion, "Herculaneum," to win the sweepstakes at the Richland county fair of 1892, and a Belgian to be exhibited at Lancaster four years later. Throughout the history of the county fair in this state, the standard-bred horse was exhibited at every exhibition, gradually gaining prestige until the bubble burst in 1893 and the fabulous prices vanished, forcing many breeders to sell out.

At the time of the Morgan and thoroughbred introduction at the first Wisconsin county shows, sheep were exhibited under two department divisions, one for the short-wooled breed and one division for the long-wooled animals. In 1850, the Saxon and Merino breeds appeared at the Kenosha County Fair; in 1857, classes for Leicester, French Merino and Spanish Merino sheep were offered at Racine, Southdowns appearing at Waukesha the same year. The Cotswold was first exhibited at the Elkhorn fair of 1870, and the Oxford Down, Hampshire and Shropshire soon found classes open to them at the majority of Wisconsin fairs. The most popular breeds in the state at the present time are the three last-named breeds and the Southdown mutton animal. The above record shows that while the early settlers were very much in need of woolen clothes, it does not explain why they were slow to introduce pure breeds of sheep.

At the early fairs very few swine were exhibited, and we find mention of the fact that the few hogs in the country were very inferior, some having been driven from Illinois at an early date. Probably the first swine of pure breeding to be brought into the state came to Grant county in 1847 from Albany, N. Y. Classes for the Suffolk, Essex and native breeds were placed at the Green county exhibit of 1854. Chester White hogs were shown at the Grant county exhibition of 1857, and another large-type white hog, the Victoria, was exhibited at Elkhorn in 1887. The Poland China, Duroc Jersey and the Yorkshire swine were found to be the leading swine at the Kenosha fair of 1883. At the present time the lard type including the Berkshire, Chester White, Poland China and Duroc Jersey are the most popular breeds in the state.

Such then is the history of the appearance of the several breeds of live stock as they made their entry into the records of the agricultural societies of Wisconsin and as the county newspapers published the award of premiums. Glen W. Vergeront.

In and Around Wisconsin

The Jersey breeders of Sauk county met Saturday, July 28th, and organized the Sauk County Breeders' Association, electing the following officers: President, Ed. A. McGilvra, Baraboo; vice president, Frank E. Brimmer, LaValle; secretary-treasurer, W. L. Bible, Lime Ridge.

J. A. Roberts, of Oconomowoc, Wis., will judge at a number of fairs in Wisconsin this fall, and will also accept a few appointments in other states. His present engagements include St. Croix Falls, Portage, Elroy, Waupaca, Mauston, Wausau, De Pere and Elkhorn. Mr. Roberts has been an exhibitor of stock for several years, and has a wide acquaintance among exhibitors in several states. He is familiar with conditions and cattle in Waukesha county, from which so many good cattle have been shipped.

Five enterprising settlers living in Chippewa county have organized what is probably the first land-clearing association ever formed in this state. These men have purchased coöperatively a stump puller and will construct a Conrath piler. They expect to work together, spending at least one week on each man's farm. They own adjoining farms, and propose to clear their land ready for the plow and for crop production through this coöperative effort. Wisconsin's whole program of land clearing and its plan of making ready for settlement its vast cut-over tracts is gaining the close scrutiny of the federal government. The officers of the Federal Farm Loan Bank, of St. Paul, which is concerned with the occupation and use of the idle acres of the states of Michigan, Wisconsin, Minnesota and the Dakotas, were in Holcombe last week inspecting the work done by the University of Wisconsin and its coöperators in demonstrating easier, cheaper and better ways of land clearing. They spent considerable time familiarizing themselves with the possible uses of this reclaimed land and appraising the loan values of its prospective farms. After a tour of a large section typical of the state's empire of brush land and a careful inspection of the coöperative land-clearing project, the members of the board, which includes E. G. Quamme, of North Dakota; Ben F. Faast, of Wisconsin; H. K. Jennings, of Michigan; A. H. Turretin, of Minnesota, and W. S. Harris, of Minnesota, expressed confidence in the future of the northern counties and paid high tribute to the work being done to speed up the clearing and settlement. "Wisconsin is pointing the way by attempting to settle scientifically its unoccupied acres," declared one of these federal bankers. "If the work started a year or more ago is continued along the same rational lines the citizens of this state will have opportunity to know not only what are the methods of stumping which are most economical of time, money and effort, but will also have the scientific information on land value before, during, and after the process of land clearing which is necessary to establish loan values." He and the members of the bank were accompanied on the trip by a delegation of regents from the University of Wisconsin.

Build up the Herds.

To the Editor:—Recently a close student of business affairs and market conditions in general made the statement that 20-cent beef would come within a few months. When you stop to think about it beef is not selling as high on the hoof as either pork or mutton. With the requirements that have been placed on the beef supply it would seem that a higher price for beef at the present time would be entirely appropriate. Think of a leading packer advocating at least one meatless day each week in order that the supply might be adequate to meet the demand. And yet in a recent interview J. Ogden Armour is quoted as having advocated this practice. I refer to it here merely to call attention to the recognition of the acute shortage of beef.

The entrance of this country into the war will increase the consumption of meat. The food products of the farm will be relied upon to a larger and larger extent as we progress in this world conflict. With this condition actually upon us the certainty of higher values placed upon beef-breeding stock should determine breeders to strengthen rather than deplete their herds. The situation offers something more than opportunity to enlarge profits; it involves an obligation to assist in maintaining the food supply.

Breeding cattle have been selling for the future. It seems certain that prices must advance and production increase in order to maintain anything like the proper ratio to consumption.

Losses in live stock have been heavy in the Northwest, due partly to the excessive snowfall of the winter and partly to the late spring. There is one consolation the ranchmen have and that is that they will realize as much for the hide as they did for the entire animal a few years ago. Leather requirements are now an important item in the value of the animal, but only an item.
